California.—John B. Yount, Dixon, device for laying out orchards; Thomas L. Williams, Big Bend, carriage-jack; Abner C. James, Pomona, shoe-lacer; Chauncey W. Gibson, S. F., leverage carbonizer; Matthias S. Dickinson, Los Angeles, driving-rein; Harry R. Ekstrom, Santa Rosa, assignor of half to A. F. Chisolm of Los Angeles, cannon-wheel remover; John T. Charest, Red Bluff, assignor of a third to J. Marcott of San Jose, water-proof attachment for boilers; John A. Beals, assignor to E. S. Delamater, Los Angeles, oil-burner.

MECHANICAL PROGRESS.

A New and Perfected Axe.

American mechanics have always excelled in the manufacture of axes. Even Mr. Gladstone, with all his attachment for almost everything English, prefers the American to the English axe for both exercise and execution. Until now it has been generally supposed that no improvement could be made on this most useful and universal tool; but within the last three or four years Mr. W. C. Kelly, son of the American inventor of the Bessemer process, has devised a change in the shape, which will at once be recognized as a most important modification. He has been at work upon his invention and the machinery for its production for some four years and has just reached what he considers its final perfection.

The blade of the axe as now generally made presents a generally smooth face upon either side, which hugs close to the wood as it enters, and when driven well into soft wood is extracted only with great difficulty.

The perfected axe has both sides of the blade scooped out or cut away from near the edge to where the handle enters, so that the only part of the surface which comes in contact with the wood so as to afford friction or resistance either in entering or in being withdrawn is a triangular-shaped surface on both sides, the lower part of which forms the edge and running up to, or nearly to, a point in the center of the pole under the opening for the handle. This raised and triangular-shaped face is referred to by the inventor as "hurling the chip," and it is stated that, no matter if the axe is driven to the eye in the wood, it cannot stick or bind in the timber, but can readily be loosened without breaking or bending the handle. Another advantage resulting from the idea of the blade being thin is that the axe does not become stubbed as it wears away, but can be kept in order and nearly the original shape by merely grinding the cutting edge. The axe is described as made entirely of steel, the pole being of soft steel and the blade of the finest grade extra double-refined cast steel. It is forged and tempered with natural gas, and the company allude to this heat as giving a better temper than can be obtained from charcoal or any other fuel. The axe is thus put on the market with high claims as to the excellence of its shape, which is regarded as giving important advantages over others, and also with claims as to its excellence of material and workmanship. It is said that the company are receiving many letters from practical woodchoppers which express their satisfaction with it, and indicating that its use is attended with much less fatigue than the ordinary axe, the reason being, as they express it, that the axe cuts deeper into the wood with less labor, and is easily extracted. This tool will be known as "the Kelly perfected axe."

American Ability to Build War Ships.

The Chicago *Journal of Commerce* says: Irving M. Scott, general manager of the Union Iron Works of San Francisco, the leading shipbuilding firm on the Pacific Coast, was before the Naval Affairs Committee of Congress quite recently, and made some interesting statements with regard to the ability of this country to produce all kinds of war ships. He said that when the Charleston was built the steel works in this country were unable to supply the hollow shafts needed, and these had to be procured abroad. The policy insisted upon by Congress of compelling the purchase of American materials as far as possible had, however, encouraged capital to invest money in the expansion of works in this country, with the result that the shafts for the San Francisco, begun not long after the Charleston, were procured at the Bethlehem Iron Works in Pennsylvania, and not at the Krupp Works in Germany. The American shafts were superior to the foreign make, the shafts in the San Francisco showing 73,000 pounds' tensile strength and 35 per cent elongation against 68,000 pounds' tensile strength and 28 per cent elongation for the shafts in the Charleston. The Union Iron Works can now furnish all the steel castings needed in the construction of a first-class war vessel, with the exception of the plates and shafts, which have to be secured from the Bethlehem Works. These latter works are in many respects the most complete in the world and capable of the heaviest work. At Bethlehem there are larger hammers and more powerful compressing machines than at Whitworth's or Crook's in England, or Cruzet's in France. Bethlehem has a 125-ton hammer, while Whitworth's largest is 98 tons.

A PROGRESSIVE HALF-CENTURY.—Those of us not yet 50 years of age have probably lived in the most important and intellectually progressive period of human history, remarks *Iron* of London. Within this half-century the following inventions and discoveries have either been placed before the world or elaborated: Ocean steamships, railways, street tramways, telegraph lines, ocean cables, telephone, phonograph, photography and a score of new methods of picture-making; aniline colors, kerosene oil, electric lights, steam fire engines, chemical fire-extinguishers; anesthetics and painless surgery; gun-cotton, nitro-glycerine, dynamite and a host of other explosives; aluminum, magnesium and other new metals; electro-plating,

spectrum analysis and the spectroscopic; and, pneumatic tubes, electric motors, electric railways, electric bells, typewriters, cheap postal system, steam heating, steam and hydraulic elevators, vestibule cars, cantilever bridges. These are only a few out of a multitude. All positive knowledge of the physical constitution of planetary and stellar worlds has also been attained within this period.

SOME CHANGES IN HARDWARE.—The changes in hardware during the past nine months, says the *Age of Steel*, have been cumulative in effect, and are fast bringing a new order of things into existence. In builders' hardware, many of the new designs are remarkable for their beauty of finish and artistic conception. The trimming of a house with the proper hardware—a subject so long neglected—has now assumed its true importance, and is as much the subject of personal choice on the part of the owner as anything else connected with the building. In bronze goods especially there is an increasing demand for the best and handsomest that can be made, the question of price being no consideration whatever. The new steel lock has made a favorable impression, and seems destined to hold a permanent place. The substitution of mild steel for wrought iron has gone on at a very rapid rate. In huts and hinges it is universal—it has partly made its way into bolts and tacks, and in numerous small articles it has proved its superiority. In tensile strength and toughness it compares with the best imported Norway and Swedish brands, and the days of wrought-iron goods are clearly numbered. The wire nail grows steadily in favor. In consequence of its capacity for being barbed, and being furnished with almost any head or point desired, its usefulness is increased a hundred-fold. Its latest form is the wire screw nail—a very practical combination of the wire nail and the regular screw. Owing to the advance in prices, the prospects of the steel nail are brighter, but the question of gauge still remains unsettled. The new gauge has been adopted by only a few mills, and it must receive the verdict of the consumer before it can be said to be a success. The chances are for a compromise between the old and new gauges.

IMPROVEMENTS IN BACK STEEL.—"Back steel," so-called, is a flat bar steel, having one side highly carbonized, and the opposite side comparatively free from carbon. Such steel is said to be tenacious when in use where great rotary force or heavy blows or strains are required, and less liable to break or crack while hardening. Plates or flat bars of soft steel or fine iron in pairs of equal size are placed back to back with a film of clay or other refractory material interlaid between them. They are then clamped or wired together, and the several pairs are placed "in a receptacle or flask stratified between layers of granulated charcoal." The flask, furnished at one end with an inlet tube, is placed horizontally in a snuff. It is said that Mr. M. A. Howell, Jr., of London, has taken out a patent for improvements in the manufacture of soft back steel.

KEROSENE TO REMOVE SCALE AND RUST.—It is a common thing for engineers to use kerosene to remove the scales which form on the inside of boilers. The oil is poured into an empty boiler, and then the water is turned on. The oil, floating on the water, comes in contact with the scales before the water does. The use of kerosene for this purpose in one of Milwaukee's slaughtering establishments, where the steam is used in cooking ham, beef and mutton, produced unexpected results. The kerosene mingled with the steam, and the cooked meats smelled as though they had been dipped in a petroleum well. It was some time before the cause of the seeming phenomenon was discovered.

A NEW COMPOSITE METAL.—From Cincinnati comes the story that Mr. Hatfield of Newport, Ky., has invented a new composite metal for which almost marvelous properties are claimed. It is composed of pig iron, wrought iron, copper and aluminum, bronze alloy and flux. It is produced direct from the cupola, without annealing, and yet it can be welded and hammered like iron or steel, and can be manufactured, it is claimed, at a less cost than malleable iron or steel castings. At a test made January 20th in Louisville it is said to have endured a tensile strain of 168,000 pounds per square inch, that being the limit of the machine.

AN ENGLISH SHIPYARD FOR AMERICA.—A London cable states that the firm of Armstrongs, gunmakers, intend to establish an immense shipyard in the United States and bid, through Americans interested in the enterprise, for the construction of the ironclad vessels which it is proposed to build for the United States Navy. The claim is made by the Armstrongs that they can profitably compete with the American shipbuilders on their own ground and easily command the American influence necessary to secure contracts.

THE COMING DEMAND FOR STRUCTURAL IRON is said to be very promising. Large amounts will be called for in the elevated railroad work, which is now being projected in near a score of cities. A single scheme of this kind in Baltimore will call for the expenditure of \$30,000,000. Railway terminal facilities are also being largely proposed, which will also absorb large amounts of such iron.

SCIENTIFIC PROGRESS.

New Processes for Producing White Lead.

An English Invention.

A new process for the production of white lead from lead ore has been brought out in England, which promises to be very successful, and to give us cheaper paint as well as cheaper lead. The process follows, in the main, the Bessemer method of making steel, the oxidation being produced by air instead of acids. The method, it is claimed, is not poisonous to workmen, as the old acid process is, and the product is declared to be better as well as cheaper.

"Another New Process—An American Invention."

Simultaneously with the announcement of the above English invention, the *Electrical World* of New York describes a process for producing white lead by means of electricity, which has just been patented by Mr. T. D. Bottom of Hoosick, New York.

The process devised by Mr. Bottom consists in electrolytically dissolving a lead electrode in an electrolyte containing nascent or free carbon dioxide, whereby the lead compound formed by electrolytic action is precipitated to form hydrated carbonate of lead, or pure white lead, which is then removed, washed and dried.

The manner in which this is accomplished is as follows: The electrolytic solution is prepared by dissolving in the proportion one-half pound each of sodium nitrate and ammonium nitrate to one gallon of water, and then saturating the solution thus formed with carbon dioxide, which can be done in various ways. Sodium carbonate and ammonium carbonate may be used in the place of the nitrate; but in that case nitric acid must be added until the bath is about neutral, which results in the larger portion of the carbon dioxide being driven off during effervescence. The electrolytic solution is then placed in a tank and electrodes of metallic lead are immersed in the same. The electrodes are then connected to the generating dynamo, and a current density of about 15 amperes per square foot of anode surface is maintained. Upon the passage of such a current between the electrodes through the bath, the white lead begins to fall very rapidly. As the carbon dioxide is taken up from the bath to form the hydrated carbonate of lead, it is, of course, necessary to have the bath replenished with additional carbon dioxide as the process continues. This can be done in several ways. A convenient way in doing this consists in burning limestone, washing the gas produced by the dissociation of the constituents of the limestone, and supplying the gas directly to the bath.

The white lead is from time to time removed from the tank, wetted and dried, and on being mixed with a suitable oil into a paint it is found to have much greater covering properties than ordinary commercial white lead formed by dissolving lead in acetic acid in the presence of carbonic acid, since the latter is slightly crystalline and less opaque than the hydrated carbonate produced by the action of carbonic acid on the lead. By this process the lead is dissolved at the rate of 59.52 grains per ampere per hour.

Electrification of a Steam Jet.

The following is a brief abstract of a paper recently read before the Physical Society of London, by Shelford Bidwell:

The author showed that the capacity of steam issuing from a nozzle is greatly increased by bringing electrified points near it, and that its color is changed to orange brown. Electrified halls and disks when placed in the steam produce similar effects, and when these are connected with an influence machine at work, the decoloration of the jet rapidly responds to each spark. On examining the absorption spectrum of the unelectrified jet, little or no selective absorption was detected, but on electrification the violet disappeared, the blue and green were diminished, and the orange and red remained unchanged.

From these results the author concludes that electrification causes an increase in the size of the water particles in the steam, from something small, compared to the wave length of light, to about 1.50,000" in diameter. Allied phenomena with water jets have been observed by Lord Rayleigh, who found that a straggling water jet is rendered much more coherent by bringing a rubbed stick of sealing-wax near it. These observations are of considerable meteorological interest, for the steam jet phenomena go far toward explaining the cause of the intense darkness of thunder clouds, and of the lurid yellow light with which that darkness is frequently tempered.

After making his experiments, the author learned that similar observations had recently been made by the late Robert Helmholtz, who viewed the steam jets by reflected light against a dark background. On electrification the jets became much better defined, and presented diffraction colors. Luminous flames also produced similar effects, and Mr. Bidwell has found that glowing touch-paper is equally efficient.

Helmholtz conjectures that the sudden condensation may be due to molecular tremors or shocks imparted by the electrification upsetting

the unstable equilibrium of the supersaturated vapor, just as a supersaturated saline solution is suddenly crystallized when disturbed. Another hypothesis suggests that condensation is caused by the introduction of solid matter into the jet by the exciting cause, thus providing nuclei upon which the vapor may condense.

On reading Helmholtz's paper, the author tried the effect of gas flames on water jets, and found that when luminous they influenced the jet considerably, whereas non-luminous flames had no appreciable effect. He also found that luminous flames are positively electrified, and demonstrated this before the meeting.

Prof. Rucker, in discussing the paper, said that he thought the surface tension of the films surrounding the water jets would be modified by the presence of an electrified body, and that the smoke from the touch paper used in some of the experiments on steam jets would introduce solid particles and facilitate condensation. Prof. S. P. Thompson commented on the contrast between Mr. Bidwell's experiments and those of Dr. Lodge on the dissipation of fog by electricity, and also asked whether the color of the jet depended on the length of spark produced by the machine. Prof. Forbes thought a crucial test between the two hypotheses of Helmholtz could be obtained by trying the experiment in a germless globe. The president, Prof. Rhinold, said he had recently noticed that gas flames were electrified.

Mr. Bidwell, in reply, said he might have mentioned that the effect of flames on jets may be due to dirt, for if soap or milk be added to the water in the steam generator no effect is produced by electrification or flame. As to change of color with spark length, little, if any, variation is caused thereby. He had not tried whether a red-hot iron produced any effect on a steam jet.

POWDERED MILK.—A Swiss savant has made a discovery which seems almost to reverse known natural laws. He reduces milk to a dry powder in such a manner that by the addition of water it at once assumes all its natural properties. It is claimed that milk in this form is much better than condensed milk for one reason—it has no sugar in it. It is well known that condensed milk cannot be used in many departments of cooking on account of this sugar, and this also makes it objectionable for use with very young children, not that sugar itself is injurious to babies, for it is always put into their milk, we believe, but it is better that this sugar be put in fresh at the time of preparing milk for the child. How far this powdered milk will answer these objects remains to be seen. One thing is certain, the powder would be much better for transportation and more handy to have in the house than either plain or condensed milk, provided it is a success. It looks somewhat dubious as a complete substitute for plain milk, not only on account of necessary expense, but we do not find any kind of food capable of being thoroughly dried and afterward made over with water so as to closely resemble the original article, and we never expect to see it done with cow's milk. Nature has a way of mingling these things that thus far man has not been able to closely imitate. This invention is due to Dr. Krueger, a Swiss savant, and under his management a company has been organized to make milk powder in Switzerland.

NATURAL GAS AND COLD WEATHER.—The natural gas supply for heating one of the public schools at Pittsburg, one cold morning last week, gave out, and the flow was not resumed for several hours. In explanation, an official said: "There is always a scarcity of gas when the weather suddenly becomes cold, but the number of complaints we have received is comparatively small. Very often the scarcity of gas is due to some local trouble like the freezing up or breaking of a pipe. We have plenty of gas, but it always contracts in very cold weather. As to the possibility of gas giving out at its source, attention is called to a well in the Titusville region, the first, in fact, from which gas was piped, and which, after a service of 15 years, is flowing as freely as ever. The people in Western Pennsylvania who have used gas for so many years, have ceased to feel alarm at the possibility of the fuel giving out, though occasionally the subject is discussed for speculative and other purposes."—*Pittsburg Pottery*.

DEVICE FOR REGISTERING THE SPEED OF VESSELS.—The principle of the anemometer, the instrument which is generally used for measuring the velocity of the wind, and which is, essentially, a small, delicately poised, self-registering windmill, with flat or cup-shaped arms, has been applied to a device for registering the speed of vessels. The little mill, made very strong and protected as far as possible, without interfering with its accuracy, from accidental blows, is placed under the keel of the vessel amidships. Its velocity varies, of course, with the varying speed of the vessel, and its motion is communicated to a small vertical shaft which passes up through the ship to a point on deck, where the number of revolutions is registered upon a properly constructed dial.

LIQUEFYING OZONE.—O'zewski, the Russian physicist, has succeeded in liquefying efficient ozone to determine the boiling point, which is -159 Fahr. The liquid ozone is dark blue in color, and is nearly opaque in a layer of a tenth of an inch thick.

GOOD HEALTH.

Dosimetry.

EDITORS PRESS:—Permit me to make a few comments on an article entitled "Drugs and Doctors," which appeared in your issue of January 25, 1890. It is true that there are to-day many physicians, who, like Drs. Holmes and Welch, are skeptical as to the power of drugs in the treatment of diseases. I believe that this feeling has arisen from the disappointments caused by the uncertain activity of medicaments in general use. The ordinary preparations of pharmacy, such as tinctures, extracts, decoctions and infusions, do not give us the exact strength and activity of drugs. Many times poisonous, they have also often proved inert. The variability of the therapeutic power of medicinal agents depends on conditions affecting the growth and cultivation of plants, their degree of freshness and maturity. Such variability must make the dosage uncertain, and therein lies one great cause of the skepticism displayed to-day in the ranks of the profession. Another cause is that while great attention has been paid to pathology, physiology and chemistry, the science of therapeutics, which is the corner-stone of medicine, has been neglected and misunderstood. It is the stone on which the profession has split, and which has led to the formation of schools differing widely in practice.

But however slow the advance in this branch, however acrimonious the disputes over the various systems in use to-day, we need not despair. A ray of light has at last appeared which will do much toward clearing up uncertainties and soothing the ruffled feelings of the various disputants. If allopathy has been denounced for its enormous doses, homeopathy has erred also by plunging into the ethereal depths of mysticism, thus practically acknowledging medical nihilism.

Chemistry and physiology are making wonderful progress in clearing away the cobwebs of doubt and obscurity in the treatment of diseases. Chemistry, by isolating the active principles of drugs, is giving us agents of definite power and activity, and physiological experiments are teaching us the mode of action of these agents.

The discovery of quinine has given an impetus to chemical researches, and to-day we possess quite a number of substances representing the active principles of plants.

Up to the present, the science of therapeutics has been running in the deep rut of empiricism and routine, owing to the uncertain and dangerous preparations of pharmacy, but the use of the active principles of plants, or alkaloids as they are called, has operated a most beneficial change in the practice of medicine. Medical nihilism or fatalism, which had so largely invaded the ranks of the profession, is giving way to renewed faith in the powers of medicinal agents, thanks to the more extended introduction of those active medicaments in the treatment of diseases.

Prof. Burggräve of the University of Ghent, in boldly proclaiming the errors of polypharmacy and the hinderer method of prescription, has rendered a great service to medicine and humanity. The dosimetric method of therapeutics introduced by this energetic worker in the fields of medicine about 20 years ago is now coming to the front, after much opposition and elight. In advocating the use of the alkaloids and teaching the proper way of using them, this method has lifted medicine out of the mire of uncertainty and skepticism. It replaces routine practice by one characterized by activity and precision. It is the condemnation of expectancy and nihilism in the treatment of diseases.

The great principle enunciated by the professor of Ghent is clear: "To acute diseases, oppose an acute treatment; to chronic diseases, one adapted to the march of the disease." The regulation of acute diseases is the cardinal principle of dosimetry. There are two periods in disease—a first or dynamic, and a second or organic. In the primitive stage, all diseases resemble each other; the prominent symptom is fever, as shown by accelerated pulse and increased temperature, and it is against this primitive phase that the regulatory treatment is directed. If we at once restore the disturbed equilibrium by the use of pure and active medicaments, such as the alkaloids, the patient is saved from the organic changes which are sure to follow the first stage if not treated energetically. The secondary or organic phase of disease constitutes the grave side of the affection against which medicine has at best but uncertain means.

Another cardinal principle of the dosimetric method is the mode of using the alkaloids. In attempting the regulation of diseases, there is a dominating point to be reached in the administration of these powerful medicaments in order to obtain the desired effect. The rule is to give them in minute doses, at short intervals, stroke after stroke, until the morbid symptoms are controlled. This rule gives the practitioner a precise and active mode of treatment which enables him to vanquish disease in its first stage and prevent those pathological changes which so often endanger life.

In a limited communication like this one, it is impossible to enter into a fuller explanation

of this most valuable method, and I will refer any one desirous of further information to a paper which I read before the San Francisco County Medical Society, and which was published in the January number of the *Pacific Medical Journal*. The dosimetric method is now followed by thousands of physicians in the Old and New World, and its adherents are increasing rapidly in numbers. At a late session of the Paris Academy of Medicine, the value of alkaloidal therapeutics was discussed and recognized, thus paying homage to the labors of the great professor of Ghent, Dr. Burggräve.

1615 Sacramento St.

USEFUL INFORMATION.

A CURIOUS RELIC.—E. S. Wilson, a blacksmith of Oark, Mo., has a relic of the Marchfield cyclone, which occurred on April 13, 1880, that is a very remarkable curiosity. This witness of one of the freaks of the great storm is a black quart bottle, bent by some mysterious force into an elliptic circle without a crack or break in the glass that the closest scrutiny can discover. The neck of the bottle actually touches the edge of the bottom, and the feet that the glass was not broken in any way by the force of the storm is shown by its holding water or any other fluid. By gradually turning the bottle as the water is poured in, it can be nearly filled to its full capacity, so as to show the perfect soundness of the material. The bottle was found by Mr. Wilson the day after the Marchfield disaster, and examined by Prof. Tice. The meteorologist attributed the bending of the bottle to the force of electricity, and considered this one of the most wonderful results of the agency at work in the storm-cloud. The bottle was found in the wreck of one of the Marchfield drug stores.—*Ex.*

TO STOP A HORSE OR COW FROM JUMPING.—You can easily stop a horse or cow from jumping fences when out at pasture in this way: Put a strap, with a ring on it, around the near foreleg, above the knee, and a surcingle or belt with a ring around the body. Then, by a short strap or piece of rope, attach the two rings so as to make a harmless yet perfectly effective hobble. Halter-pulling in the stall may be effectually and easily broken. Put a slip-noosed rope around the body, lead the end of it between the animal's forelegs up through the halter, and make it fast to the manger. Then go up in the loft and throw down a lot of clattering tin pans into the manger. When the horse jumps back the rope will catch him and bring him forward. It will not be long before you cannot make him jump back.—*Ex.*

TESTS FOR UNDERWEAR.—A new method of testing woolen garments is by putting caustic soda into a cup of water and dipping the article whose genuineness is doubted into the mixture, of course being careful not to touch the liquid. The caustic soda will quickly eat animal fibers, but has no effect upon those of vegetable origin. If the article is all wool, it will be dissolved in the liquid, leaving nothing but a trace of coloring matter. If the material is cotton, it comes out unscathed. When the material is wool supported by a framework of cotton, the latter being distinguishable to the eye or by ordinary tests, the caustic soda quickly divorces the two, dissolves the wool and leaves the cotton as clean as if it had been woven by itself.

TO WASH POCKET HANDKERCHIEFS.—Wash all good pocket handkerchiefs by themselves, quite apart from the other things. Soak them over night in cold water, then wash them in good hot water, using the best white soap; rinse them in clear cold water, squeeze the cold water out of them, rub well with white soap, and boil them for 20 minutes, with some lump borax in the water. Then rinse them again, and if any spots remain, wash them. Blue in the usual manner, and iron before they are quite dry with a well-polished hot iron. Handkerchiefs treated in this way will wear better, and will keep their color even when they are in rags.

THE LATEST and most unique invention is a machine for buttering bread. It is used in connection with a great patent bread-cutter, and is intended for use in prisons, workhouses and other reformatory institutions. There is a cylindrical-shaped brush which is fed with butter and lays a thin layer on the bread as it comes from the cutter. The machine can be worked by hand, steam, or electricity, and has a capacity of cutting and buttering 750 loaves of bread an hour. The saving of butter and of bread, and the decrease in the quantity of crumbs, is said to be very large.

A NEW AND ARTISTIC IDEA has been introduced at dinner parties lately. The knives and forks are all different, and each one made after some special design. Diminutive copies of antique German and Turkish swords serve the guests as mace-bearers for knives, matched with tiny daggers of Italian pattern given to those of the sex feminine.

THE manufacture of luminous paint has been begun in Austria on a large scale, at about a sixth of the cost hitherto. A special paper is supplied for use when the paint is applied to walls,

ELECTRICITY.

The Deterioration of Electrical Conductors.

A correspondent of *La Lumière Electrique* gives an account of some of his observations on the deterioration of copper conductors by the long-continued passage of strong currents of electricity through them. His attention was first called to the question in 1884, when he examined the electrical and mechanical properties of some pieces of electric-lighting cables that had been in use for some years. One specimen which had been in use for 20 years gave very striking results. It was extremely brittle, and broke in fragments under the hammer, while its fractured surface resembled in all particulars that of electrolytic copper. The current through this cable had not been in any way excessive, nor had it been subjected to any heavy mechanical straining. Similar though less marked results were obtained with other cables, which had been in use for shorter spaces of time. The currents in all these cases were direct; but he afterward had an opportunity of examining the effects produced by an alternating current. This wire had become very brittle; its electrical resistance, moreover, had increased about 31 per cent. It was then determined to make some systematic experiments on this subject. He endeavored in the first place to determine whether the long-continued passage of a powerful current of electricity caused any expansion of the wire, and secondly, whether end in what degree it altered the elastic properties of the material.

These experiments are very elaborate and very carefully made, and have not yet been completed. During the first nine months of the four years of their continuance the observations showed a want of uniformity, but since then have been very regular, and the results now published show that the elastic properties of the wire have been very considerably changed. This variation takes place the more rapidly with strong than with weak currents, and with alternating than with direct.

INCREASING USES OF ELECTRICITY.—The increase in the use of electric lights and electric motors is shown by the *Electrical World* to be greater during the past few years than most people probably imagine. The number of electric-lighting companies in the United States and Canada operating central stations at the beginning of 1886 was 450. This number had increased at the beginning of 1887 to 750, at the beginning of 1889 to nearly 1200, and at the beginning of 1890 to 1277, including 25 in Mexico and Central America. Meantime 266 gas companies had engaged in electric lighting, so that the total number of companies engaged in electric lighting at present is 1543. The number of isolated or private incandescent and arc light plants at the beginning of 1887 was about 1000 each. Now there are 3925 private plants in the United States, 175 in Canada and 200 in Mexico and Central America, making 4300 in all. The number of arc lamps in use in 1882 was 6000. This number doubled each year for four years and has since grown rapidly until there are now 235,000 arc lamps in use. The number of incandescent lights has increased from 525,000 in November, 1886, to 3,000,000 at present. The number of electric motors now in operation in the country is estimated at 15,000. There are nearly 200 electric railways in over 125 towns and cities, and these have in operation or under contract 1884 cars on 1260 miles of track. These motors find their greatest application in connection with electric-light plants. Electricians, however, look for a great development of electric motors for railroads of all kinds during the next two years. Electric light and electric power for mining is a new development of considerable promise. The electric tramway and electric power for pumping, drilling, cutting, etc., have already been adopted to some extent with good results.

ELECTRIFIED STEAM.—At the last meeting of the Physical Society of London, the members were much interested in some very beautiful experiments of Mr. Shelford Bidwell, F. R. S. In one of these experiments a powerful electric light cast a shadow of a steam jet upon a screen, but the shadow was barely visible, nor did it appear very brilliant under the illumination. A needle-point was then held near the jet and electrified by being connected with a Wimshurst machine. Instantly the shadow became conspicuous and of a dark brown color, while the jet itself became far more luminous and occasionally colored. The effect of the electrification is apparently instantaneous. It is probable that the explanation may be closely connected with Lord Raleigh's well-known experiment of electrifying a jet of water, which then ceases to cohere and fell in small drops, but instead draws itself together and falls in large falling drops. As Lord Raleigh's experiments explain the large drops associated with a thunderstorm, so Mr. Bidwell's seem to throw some light upon the cause of the extraordinary blackness of the thunder clouds and of the lurid light so often seen in the sky before a storm.

MINING HAULAGE, ETC., BY ELECTRIC MOTORS is a matter which is just now exciting considerable interest among mining men, particu-

larly in coal mines. The machinery employed is very compact and occupies much less space than that required for either steam or animal haulage. Now that electric motors have become a commercial article and have been proven to be perfectly practical, we may soon look for a very general use for them everywhere. The number of electric motors, large and small, now in use in this country, is estimated at 15,000, many of which are from 15 to 50 horsepower.

THE NATIONAL ELECTRIC LIGHT ASSOCIATION held its annual meeting during the second week in February, at which a large number of valuable papers were read on various subjects connected with electric matters in general. The public proceedings have not yet reached this coast.

ELECTRIC LIGHT WITHOUT DYNAMOS.—A dispatch from Berlin, dated Feb. 19th, says that Henry Weigert, a Berlin banker, has just taken out a patent in Germany for the production of an electric light without the use of either dynamos or accumulators.

THE BUILDER.

NEW STYLE OF FLOORING.—BEDDING IN ASPHALT.—A curious method of laying floors has been adopted in France and obtained a wide application. It consists in embodying the flooring in asphalt. The new floors are used mostly for the ground stories of barracks, hospitals, and for churches and courts of law. For the floors in question, pieces of oak, usually 2½ by 4 inches broad, 12 to 30 inches long and 1 inch thick, are pressed down into a layer of hot asphalt, not quite half an inch thick, in the well-known herring-bone pattern. To insure a complete adhesion of the wood to the asphalt and obtain the smallest possible joints, the edges of the pieces of wood are planed down, beveling toward the bottom, so that their section becomes wedge-like. Nails, of course, are not necessary, and a perfectly level surface may be given to the flooring by planing after the laying down. The advantages of this flooring, which only requires an even bed on which to rest, are said to be the following: 1. Dampness from below and the rotting of boards is prevented. 2. Floors may be cleaned quickly and with the least amount of water, inuring rapid drying. 3. Vermin cannot accumulate in the joints. 4. Unhealthy exhalations from the soil cannot penetrate into the rooms. Asphalt being impermeable to damp, rooms become perfectly healthy, even if they are not vaulted underneath. In buildings with several stories, as in hospitals, the vitiated air of the lower rooms cannot ascend, an object which has hitherto not been possible to attain by any other means known. 5. The layer of asphalt will also prevent the spreading of fire from one floor to another in case of conflagration. The flooring described has been laid in the numerous casemates of the forts around Metz, to the satisfaction of the authorities. The cost is about 25 cents per square foot. This estimate, somewhat high, would be much lower in districts where oak and labor are cheaper, and the distance from places of construction less.—*Builder and Woodworker.*

BUILDING IN SAN FRANCISCO IN 1889.—Although during the year 1889 there were not quite so many buildings erected in this city as in the preceding year, the builders and carpenters enjoyed a 12-months' season of prosperity. Building material was cheap and wages were about the average. The real estate market was in a quite active condition, and purchasers of land were not slow to improve the property which they had purchased. According to a summary which the editor of the *California Architect and Building News* has prepared, the number and value of buildings erected in San Francisco during 1889 were as follows: Frame buildings, 841, valued at \$4,194,641; brick buildings, 36, valued at \$2,073,329; additions and repairs, 204, valued at \$755,855; total number, 1081, valued at \$6,963,825. Besides the buildings and repairs above noted, the other improvements in the city have aggregated \$500,000, making a grand total for the year of say \$7,500,000 in the city, being far in excess in value of any preceding year, although not in the number of buildings. The value of buildings erected for each year from 1880 to 1888, inclusive, will be found interesting, for comparison, as showing the regular and rapid increase of values in this direction. We copy as follows: \$1,754,435; \$3,790,732; \$3,896,212; \$5,261,689; \$6,202,807; \$7,043,999; \$6,401,669; \$6,605,054; \$6,244,220.

A MAGNIFICENT STRUCTURE.—Plans have been perfected in Chicago for the building of a Masonic temple at the corner of State and Randolph streets. The building will be the finest of the kind in the world, and will cost \$2,500,000, and cover a quarter of a block. The movement for a new Masonic temple in San Francisco is taking a definite shape.

MARVELS OF MODERN BUILDING.—The marvels of modern building seem to be without end. The contractors take hold of a five or six story structure of brick, stone and mortar, push it up, lower it, change its entire character, and remodel it without apparently disturbing the lines of safety or utility. Apparently nothing baffles the modern builder.

Passing Events.

The bursting of the Walnut Grove dam, Arizona, by which many lives were lost and much property destroyed, while a most deplorable event, will serve also as a warning for the future. Competent men informed the company of its improper construction and consequent unsafety, but the advice was disregarded. It was built in a cheap way and not fit for its purpose, as the result shows. As there are intentions of building dams in many places, the companies which undertake them ought to be compelled by law to carry on the work so as to afford protection to those who might be endangered by failure.

The miners along the Klamath have had hard luck this winter, having lost their wheels, derricks and other portions of their mining outfits by unprecedented floods.

Underground work at the Grass Valley mines, the center of the quartz industry of the State, is stopped. Water-power is wanting, the ditches being broken. Some of the mines are pumping by steam. They have great quantities of water to contend with this winter.

At Tunnel 9 on the Oregon line, where great landslides have occurred, in order to remove the earth, they have put in hydraulic apparatus of 13 steam force-pumps, which is now doing

the work of 600 men daily. The apparatus has a capacity of 3500 gallons a minute, and the giant nozzle is now discharging about 2500 gallons a minute, sluicing the earth into a level space along the river.

Dividends and Stock Fluctuations.

They are just beginning to find out a few things about mining stock exchanges in Colorado. They have not been able to understand why a mine that pays regular dividends has no special attractions on the Denver Exchange, and that speculative stocks are preferred. This has been the case for 20 years in our local stock exchange. The prices of the dividend-payers are more steady than those stocks which never paid dividends and never expect to. The brokers and dealers don't care a button about dividends in stocks. They make their money from fluctuations in the market value of the stock, not the actual value of the mine itself. The latter interests them not at all. In fact, if there were a fixed value on a mine, the stock would also have a fixed value, and the brokers would have no use for it.

While the original intention of stock exchanges was to sell stock so the respective mines could be developed, they have long since lost sight of that feature. The stock is bought and sold as a gamble or speculation, with very little reference to the mine itself. The companies once having sold the stock have no interest whatever in it, unless the individual owners fail to pay assessments, and it comes back into the company's possession. They would much rather have the assessments paid than to have the stock back.

We have realized this matter so many years here in California, that since we settled down to legitimate mining the California gold mines do not appear on the stock boards. In fact it is rather to the detriment of a gold mine to have it listed. The stocks dealt in here are mainly those of Nevada silver mines. Many of those called on the boards never paid any dividends, and it would be a matter of surprise if they should. It is not expected of them. Of course this is not always the case, but it is as a general thing. Ore developments, or promise of developments, influence the stock, but as soon as a mine settles down to a regular dividend basis its value becomes too fixed to admit of such speculation as the brokers and dealers desire.

The Mechanics' Institute.

The annual election of the Mechanics' Institute on Tuesday was a warmly contested one, there having been two tickets in the field. The total vote cast was 1295, of which the nominees on the Regular ticket received the following: David Kerr, 709 votes; A. W. Starbird, 735; Geo. H. Hopps, 693; A. W. Scott, 698; Robert Ewing, 696; J. K. Firth, 730; W. T. Y. Schenck, 701. The vote cast for the opposition or Members' ticket was as follows: Chas. L. Taylor, 602; Henry Root, 608; Benjamin Marshall, 595; A. P. Flagler, 554; W. A. Beatty, 567; James H. Barry, 550; Charles Elliott, 614.

As stating the position of the elected officers with relation to the officers of the Institute, we reprint the following circular issued before the election:

There having appeared in the daily papers statements reflecting on the directory of the Institute, a plain statement of facts becomes necessary, in order that no member may be misled.

The majority of the present directors and nominees have been in the board for a number of terms—in fact, since the erection of the present pavilion on Larkin street.

In the year 1879, the assets of the Institute were fairly estimated at \$204,969; the number of books in the library, 27,026 volumes; number of members, 1767.

At the close of 1889, the assets of the Institute were valued at \$1,222,558, clear of all indebtedness; number of volumes in the library, 48,153; number of members, 3557—showing during the past ten years a gain in property of \$1,017,589; in books, of 21,127 volumes; and in membership, 1790. So much for the management of the present board.

It is beyond a question that the present library quarters are wholly inadequate, and the board has under consideration the feasibility of erecting a library building on a portion of the pavilion block, anticiating the remaining land will produce a revenue sufficient to pay the principal, interest, taxes and insurance, and have the library unincumbered at the expiration of say 17 years.

Fairs will be held in the present pavilion as long as the trustees find the premises adequate

and suitable for the purpose, and no action has been taken, nor is there any intention of moving the pavilion from its present site.

The chess and reading rooms occupy, with the exception of the small rooms filled with books, the entire upper floor of the Institute. There can be no enlarged accommodations until new quarters are secured; hence the necessity of a new library.

On account of the large number of applications to the evening classes, more room was required than the library building could afford, and they were therefore removed to the art gallery of the pavilion, where all needed accommodation was secured.

The above is a statement of facts and the official action of the trustees as recorded.

The trustees-elect will be installed at the annual meeting on Saturday evening of next week. The contested election has had the effect of interesting most of the members in the business affairs of the Institute, which should result in the general welfare of the institution.

Their victory in so sharply a contested election is a strong endorsement of the old management, under which the Institute has enjoyed a large amount of prosperity and financial success.

Finishing Stone.

The more common kinds of finish applied to stone are shown in the accompanying engraving, which are drawn from samples in the Smithsonian Institute. (See page 145.)

Rock Face Finish.—This is the natural face of the rock as broken from the quarry, or but slightly trimmed down by the pitting-tool. As in this and all the figures given, it is frequently surrounded by a margin of dove work.

Pointed Face.—In this finish the natural face of the rock has been trimmed down by means of the sharp-pointed tool called a point. It is used principally for exterior work, as in the walls of a building. Two common styles of pointing are shown.

Ax-Hammered Face.—This finish is produced by striking upon the surface repeated blows with a sharp-faced hammer, called an ax or pean hammer. It closely resembles the next, but is coarser. Used in steps, house-trimmings and other exterior work.

Patent Hammered.—This finish is produced by striking repeated blows upon the smooth surface of the rock with the rough-faced implement called a patent hammer. Five grades of fineness are commonly recognized, the 4-cut, 6-cut, 8-cut, 10-cut and 12-cut surfaces, made by hammers composed of four, six, eight, ten and 12 plates, respectively. A very common finish for the finer kinds of exterior work.

Bush Hammered.—This finish resembles closely the tooth chiseled or very fine pointing. It is used mostly on soft stone.

Square Drove.—The square drove surface is made with a wide steel chisel with a smooth edge, called a drove. It is quite common to see this style of finish as a border to the rock-face or pointed surfaces in many kinds of exterior work.

Tooth Chiseled.—This finish is produced by means of a wide steel chisel with an edge toothed like that of a saw. This and the square drove are used principally upon limestones, marbles and sandstones, the granites being too hard to be cut in this manner.

Saved Face.—This is the surface of the rock as left by the saw; the saw used for the purpose being a thin, smooth blade of soft iron, fed with sharp sand or chilled iron. This and the following styles, although possessing distinctive characteristics easily recognizable by the eye, are of such a nature that their likenesses cannot be well reproduced on paper. Hence, no attempt at illustration has been made.

Fine Sand Finish.—To produce this finish, the chiseled or sawn surface of the marble is rubbed smooth by means of a block of stone and fine wet sand or on the machines yet to be described.

Pumice Finish.—This is a very smooth but unpolished surface produced by smooth rubbing with pumice or Scotch hone.

Polished Surface.—Two kinds of polished surfaces are made—the acid gloss and the putty gloss. For either, the surface of the stone is made as smooth as possible by means of sand, or emery, and pumice, or hone, after which it is rubbed with moist woolen cloth and oxalic acid, or polishing putty. Frequently the two methods are combined, especially in tombstone work.

The Walnut Grove Dam.

Its Breakage Resulted in Great Loss of Life.

On Saturday morning last the large storage dam built across the Hassayampa creek, Arizona, by the Walnut Grove Water Storage Co., gave way under the pressure of a flood, and the water swept everything before it for miles, drowning about 100 persons. The service dam of the company, located 15 miles below the reservoir, and 15 miles of flume just approaching completion, were also swept away. Altogether the company has spent over \$800,000 on the enterprise of storing water for hydraulic mining, and the machinery had arrived, and they expected to commence operations next week. The dam which held the waters back was 110 feet long at the base and 400 feet at the top. It was 110 feet thick at the base and 10 feet at the top, forming a lake three miles in length by three-fourths of a mile wide and 110 feet deep.

The main dam was about 35 miles south of Prescott, at an elevation of 3500 feet above sea level. The drainage area of the dam is 390 miles, with a supposed annual rainfall of 16 inches. The dam was built to store water principally for some alleged rich placers on the mesa, 18 miles below the dam. Cattle raising and irrigation were also secondary considerations.

Of the 42 workmen at the dam, 39 lost their lives. It was 2 A. M. when the dam broke and the water passed on down with wonderful rapidity, overwhelming ranchers and miners on its course. Some of the bodies were found 30 miles below the point where the flood overtook them. Among those lost are a number of women and children who were living in the cabins.

It seems now, from the testimony of engineers, that this dreadful accident was due to criminal carelessness in the construction of the dam, and that the company had been informed more than a year ago that the structure was unsafe through faulty construction. Loose rock was put in below the dam to strengthen it after it was built. Mr. Luther Wagoner, C. E., of this city found on examination that with 70 feet of water above bedrock the dam leaked 141 inches of water. This was more than a year ago. This alone was enough to condemn the work. Mr. Wagoner says: "Lahor was quite unreliable, perhaps owing to the presence of saloons and gambling-places and the totally inadequate provisions made for the comfort of the men by either the company or the contractors. This, coupled with the intense heat and poor water and food, did not offer sufficient inducements to attract a sober and reliable class of workmen, a point too often overlooked in the construction of a large work."

Mr. Wagoner, who is a member of the Technical Society of the Pacific Coast, read before that society in October, 1888, a paper descriptive of this dam. Before that he had been called in by the company to devise some means to improve the dam, which was leaking badly. He discovered many traces of slovenly work. He found that the filling with loose rock had been carelessly done, while the worst blunder was the failure to carefully protect with Portland cement the place of joining the inside sheath of wood to the bedrock. He warned the company at the time that disaster would be apt to follow unless there was a radical change of method, but nothing was done. Part of the responsibility of this slovenly work lies with the corporation, which wished to economize on materials, as the freight rates were double the original price of cement and other supplies. The contract for the dam proper was for 46,000 cubic yards lumped at \$2.40 a cubic yard. The skin and cementing was extra. Lumber cost about \$15 delivered at the dam, and was out at an elevation of from 6000 to 8000 feet, on the Bradshaw mountains, and was of a very poor and knotty quality. On \$1000 worth of cement \$2000 freightage was paid.

In the paper before the Technical Society above alluded to, Mr. Wagoner said:

"The country rock at the dam-site is a coarse-grained granite easily quarried. The high price of good lumber, cement and supplies determined the choice of methods of construction."

"The history of the construction of this dam is one full of blunders, mainly caused by the officers of the company in New York. Work was commenced on company account by Prof. W. P. Blake, who carried a wall across the canyon to bedrock through about 20 feet of sand and gravel. What his intentions were to do next is not known, as no records were made

Fig. 1. PROFILE OF THE WALNUT GROVE DAM, ARIZONA TER.

or kept by the company's officers at the dam. He was succeeded by Col. E. N. Robinson as chief engineer, and the work was contracted for by Nagle & Leonard of San Francisco. I presume the cross-sections and general methods of construction were fixed by Mr. R. Under him the dam was commenced in the rear of the Blake wall, and was described in the specifications as being composed of front and back walls 14 feet at the base and 4 feet at the top, with loose rock filling between (see Fig. 2). The dam to be made water-tight by a wooden skin or sheathing.

"Quarries were opened by the contractors upon both banks of the stream above the top of dam. "Coyote" holes from 8 to 15 feet deep were charged with low-grade powder (4" nitroglycerine), and the stone dislodged in large amount. These holes usually followed the intersection of two fissures at an acute angle; sometimes a third fissure would cross the others, thus forming a triangular hole and making it easy to remove by splitting the small triangle of rock. The stone was loaded upon cars, having the bed inclined at about 15°, and were lowered over the dam by a haul-wheel and brake, a three-rail road being laid on trestle across the dam, high from 10 to 15 feet. On the slope midway was a turnout so as to allow the loaded car to pass the empty car. The loaded car was unhooked on the level and run out and dumped and returned above by the next loaded car. The logs of the trestle were left in the wall, only the caps and stringers were raised. During the first stages of construction derricks were used to distribute the larger stones; later, the center was kept high and the stones for the wall were moved by bare. The effect of this upon the stability of the dam is had because it tends to form curved beds whose slope makes an acute angle with the direction of the resultant pressure.

"The company purchased a sawmill and out the lumber for the dam, buildings, etc., and the skin was put on by contract. Cedar logs 8 to 10 inches in diameter, by 6 feet long, were huilt into the wall on the upper face, and projected out one foot. Vertical stringers 6"x10", of native pine, were bolted to the logs; the stringers were about 4 feet apart; at the joints of the 6x10 stringers a cedar log was huilt in the wall about two inches above the top of the stringers, and two 4x10 splice pieces bolted through the log and spiked to the 6x10 pieces with galvanic bolt spikes completed the joint. Upon the main wall of the dam a double planking of three-inch boards was laid, having a tarred paper put on with tacks between the planks. The outer row of planks was oiled with oakum and painted with a heavy coat of paraffine paint. The junction of the plank skin and bedrock was secured by Portland cement. Through the dam is a culvert, 3x4

feet inside, about the level of the old creek channel. This is boarded with three-inch plank inside, and has a gate to draw off the water and waste it. (See Fig. 1) The water for use is taken into an inlet tower. (See valve tower, Fig. 2) This tower is built of 8x8-inch timber, eight feet long, notched one-half on each end, secured by a five-eighths rod through each corner, the joints oiled with oakum and the outside painted with paraffine paint.

"There are two inlet valves, one at the base of the tower and one 20 feet higher. The valves are of wood, sliding upon wood; area pressed upon, about 15 square feet; a six-inch square wooden stem runs up on the outside of the tower and above the platform on the tower

were designed by an engineer and must work." From the valve tower the water is conveyed in two 20-inch iron pipes to the gate-house below the dam, where each pipe is provided with a gate. The pipes go through a tunnel, part of the way through a spur, and of rubble, arched the remainder of the way. With 70 feet of water above bedrock, the dam leaked 141 inches. (1.6 cu. ft. = 1 inch.) Various theories were advanced for the cause of the leak. One was, that settlement of the dam had forced an opening of the junction of the inclined and horizontal skins; and another was, that it leaked all over the whole surface. The extreme right-hand skin below the bed of the stream (Fig. 2) is made of but one plank. The

FIG. 2-CROSS-SECTION THROUGH THE DAM.

where the mechanism is placed to open and close the valves. All this gear is mounted upon a massive iron bed-plate, resting upon a wooden frame upon the platform. On both ends of the shaft is a crank. Two men could give a pull on the valve-stem of about 700 pounds with the above described gear. With 30 feet of water pressure they could not move the valve, perhaps for the reason that the load to overcome was about 11,232 pounds. The machlues (three of them) were designed by one of my predecessors, and were erected despite of my advice that they would not work. The reason assigned for erecting them was, "they

machinery for draining the water was inadequate, and the men who did the cementing to bedrock assured me that they worked in four feet of water, and that they did not go to bedrock, while per contra the sub-contractor (Whoop'em up, Jack) for this work assured me it was well done. The probable cause of leakage, I believe, is all three of the reasons named.

"Regarding the stability of the tower, I think the pressure too great upon the timbers 8"x8"x8' to be safe, and of the dam as originally built during a month's interval, when there was no chief engineer, some very bad

work was done (see Fig. 2) left side of wall, near middle. I advised the company to cut a large wasteway and put the loose rock below the dam to strengthen this weak place."

It must be remembered that these statements were presented by an engineer to an engineering society in October, 1888. Another civil engineer, Mr. John M. Currier, says:

"Colonel Robinson was always careful and painstaking, insisting upon good work being done. In cementing the front or Blake wall a small dam was built, then pumped dry, so that the men did not work in four feet of water. The work was done by the company under Colonel Robinson's direction and personal supervision. It was a good piece of work when finished. He then ordered a coffer-dam sunk in the rear of the Blake well to bedrock. Thus a solid wall 18 feet wide was built as a foundation for his front wall, completely ignoring the Blake wall, which causes the ciff set about 25 feet from bedrock and near the original bed of the river.

"The great trouble was that skilled diplomats were required on that work instead of skilled workmen. Shortly after Colonel Robinson left, I severed my connection with the work, it being impossible to exact good work, and it was of more importance to flat bonds and sell stock on Wall street, New York, than to construct a substantial dam, as I was quietly given to understand by Major Dike, a friend of Will H. Bates, the resident director, with large blocks of stock.

"About May, 1887, the work became so disagreeable I quietly determined to leave. At this time I was superintendent of construction, appointed by the contractor and approved by the Board of Directors in New York. I had reason to believe the lower wall was hulging, and a line was placed in such a manner as to determine the fact, and it did establish that fact.

"I will state that the dam, as completed, was not according to Colonel Robinson's plans, having been changed after he left the work. His plans for wasteways were not carried out by any means, and had he been properly sustained by the company and allowed to construct the dam according to his plans, it would have been a standing monument to his memory for ages to come. The base was about 130 feet at bedrock, while the Bowman dam in California has about the same base for 100 feet in height, constructed upon almost the same plan, but little proper waste facilities. It has stood for more than 20 years—of course care being taken to prevent an overflow by providing wasteways away from the structure, and constant watching by competent and reliable men."

From the testimony thus far available, it seems that there was more speculation in stock than honest work in building a good dam. The rich placers were by no means as rich as represented. The company was told by competent men that the dam was not substantial. Those engineers who honestly tried to have good work performed were only kept a short time and left in disgust. Both Col. Robinson and Mr. Wagoner successively tried to have defects remedied, and when the company ignored their advice, they quit the work. This was also probably the case with Prof. Blake; and Mr. Currier says it was his position. The company was stocked way up into the millions, but they did not spend money enough on the engineering feature. We have dozens of these big storage-dams in California, built by competent men, and they have stood for years. But they were built of eatable material in a proper manner, and are cared for. If storage reservoirs are to be built all over the country in the improvement of arid lands, it behooves people who live and have property below such dams to have an eye on the men who inaugurate and have charge of the work of construction.

No investigation has yet been made, though latest reports would indicate that the water overflowed the dam, cut out its foot, and destroyed it, the wasteway not being sufficiently large.

More Favorable Legislation for Silver.

The Senate Finance Committee's Silver bill is short but to the point. While admitting the latter, yet we must say that it does not go far enough, for there should be embraced a section calling for free coinage at some time in the future, or, failing in this, then silver and gold should be placed on the same footing. If there is not to be free coinage for silver, then there should not be for gold. If there is to be a certain sum expended monthly in the purchase of silver, the same limitation should also be applied to the purchasing of gold. What is sauce for the goose is sauce for the gander. This has been the position of the MINING AND SCIENTIFIC PRESS from the discussion of the silver question, and this paper was among the first to take strong grounds in favor of remonetizing silver. In support of our position we published a strong array of facts and figures, the most of which have been used with good effect by others at the East. One of the most telling speeches upon the subject, and which we enlarged on in one of our bimetal articles, is that of Senator Mitchell of Oregon, delivered lately in the United States Senate. He takes strong grounds that other interests heedless that of mining are endangered by further legislation against silver, one of which is that of farming; and as this industry is the fountain of prosperity, he demanded for the farmers the remonetizing of silver.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery. Adapted to heads running from 20 up to 2,000 feet. From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Rooms with or without Board.

Free Coach to the House.
J. POOLEY.

The Pittsburgh Boiler Scale Resolvent.

This Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.

CARNEGIE BROTHERS & CO., PROPRIETORS OF EDGAR THOMSON STEEL WORKS, }
PITTSBURGH, PA. WORKS AT BRADDOCK. } Oct. 4, 1887.

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have tested nearly all Compounds presented to us, and this one is the only good thing we have ever used. Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as sulphate of lime, carbonate of lime, mud, and everything that is bad.

Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Alleghany Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern; Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT }
{ PROVES ENTIRELY SATISFACTORY. }

Pacific Chemical Works.

HENRY G. HANKS,
Practical and Industrial Chemist, Assayer
and Geologist,
718 MONTGOMERY ST., - SAN FRANCISCO.

Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Feb. 27, 1890.

General trade is again on the increase, called into life by clear skies and early prospects, without rains to the interim, of good roads. Machine-shops, iron foundries and other manufactories begin to show more activity. Several report more orders on hand, with a larger number in abeyance than at this time in 1889. The large supply of water in the mountain ranges will give renewed life to mining industry, while the bridges and other improvements in various parts of the State destroyed by high water will call for more ironwork in their reconstruction. The present outlook was never before so promising for a year of general prosperity.

In the money market our advices from all leading centers in this State are of the same tenor as prevail in this city, viz.: growing ease and less fear entertained by capitalists of losses, if they put out their funds. With confidence, money always becomes easy.

MEXICAN DOLLARS—The market has continued dull but fairly steady at from 75¢ to 76¢ cts.

SILVER—The market continues strong throughout the week at the decline reported in our last issue, with, at the close, a hardening tendency. The action of the Congressional Committee, having the silver bill in charge, in reporting a compromise bill placing silver and gold on the same footing, has no doubt done much in promoting a more healthy market for silver. It now looks as if silver legislation will be among the first. When the Committee bill comes up for debate, then a far better idea can be formed of what to expect from the present Congress. Exporters are still out of the market, but notwithstanding this, the Mint has considerable difficulty in getting silver, even by paying an advance on the Eastern and European parity.

Silver in this market has been kept steady at 95½ cents under mint purchases, although at the close other buyers are more bullish, owing to London cables coming through to-day at 44d, and New York at 95½ cents. The local mint bought since last Thursday 166,000 ounces at 95½ cents.

QUICKSILVER—Receipts the past week aggregate 227 flasks, and exports by sea 137 flasks. Those in position to know are confident of a very large home consumption, much larger than for several years past.

ANTIMONY—The supply continues light. Reliable advices report that the old sources of supply, particularly Japan and Borneo, are being exhausted. This naturally will cause high prices until new districts are developed.

BORAX—Receipts the past week were nil. The exports by sea were as follows: To Victoria, B. C., 100 lbs.; New York, 559,426 lbs.; and Guaymas, 1092 lbs. The market is very firm under a continued strong market at the East.

LIME—Receipts the past week aggregate 2833 bbls., and exports by sea, 450 bbls. to Honolulu. The home consumptive demand is steadily increasing, notwithstanding interferences by storms.

LEAD—The market is fairly firm. The inquiry is reported to be increasing. At the East, our mail advices indicate the market favorable to a large increased consumption.

COPPER—The market is essentially unchanged. Owing to interruptions to the mails by snowstorms, we are not in receipt of our usually late advices regarding the Eastern and European markets, but the latest received indicated a strong tone, and the outlook favorable to a higher range of values under a good demand.

IRON—We have added another brand to our list. The market is unchanged. Importers, as far as we can learn, are more hopeful of a free consumptive demand, which, if realized, would soon absorb outside supplies and force foundrymen and others in the market as buyers, that is, instead of holders looking up buyers, the latter would have to look up sellers.

TIN—Both spot and to arrive are dull and in buyers' favor. Consumers are well supplied, and until they see further ahead they are only tempted by concessions to anticipate any probable wants.

COAL—Imports the past week aggregate as follows: From Departure Bay, 5750 tons; Tacoma, 6432; Newcastle, N. S. W., 4886; Seattle, 7470; Coos Bay, 1960; New York, 76; Overland, 20. Total, 26,534 tons. The large receipts of Coast are against any advance, while an easier tone to the Australian freight is favorable to later on shipments from there. A new brand of Wellington coal has been put on the market, and so far as we can learn, gives good satisfaction. Cold weather and clear skies have stimulated the consumption of all kinds, but this has no effect on prices, and is not likely to unless there is a strike or else a serious accident in one or more of the leading coal mines. With longer days, the gas companies consume less coal, but then this is more than offset by a large increase to the consumption of steam coal.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Feb. 26, 1890.—The following are the closing prices the past week:

	Silver In.	Silver Out.	Copper.	Lead.	Tin.
Thursday.....	43 3/4	85 1/2	114 50	3 80	\$20 40
Friday.....	43 3/4	85 1/2	114 50	3 80 1/2	20 55

Mining Share Market.

The mining share market the past week exhibited a fair degree of activity in the Comstocks and Tuscaroras, with an attempt made to galvanize the Bodies into life. The Comstocks declined on last Friday and Saturday, but on Monday, under a sudden jump in Crown Point, there was more strength, which was soon exhausted only to be revived by an upheaval in Con. Imperial, with more activity in Yellow Jacket. This was also short-lived. After each shading off, Ophir, Mexican and other North End stocks went to still lower figures. The presiding genius of the stock department of an evening paper claims the credit of Springing on the underfired public enough bear information to cause even a confirmed "bull" to attempt the feat of diving down so as to get to the bottom and keep it from dropping out. The condition of most of the Comstock mines, even on present showing, warrants higher prices for the stock than some command, while others, again, sell too high. This is probably due to the latter being better concentrated and not producing bullion, causing them to be a better gamble as exploring work goes on. On merit, upon present showing, Crown Point, Hale and Norcross, Overman, Chollar and Savage ought to do better; while the improvement in Con. Imperial, Yellow Jacket, Seg. Belcher, Alpha and Exchequer and one or two others deserves greater attention if not higher prices.

During the past week the outside public sold more stocks than they bought. This they did under well-circulated bear points by those who have proven correct for some time past. The selling has also been assisted by authentic reports of assessments to be levied soon, and also by reports that the financial standing of the mines, to be made public on next Monday, will be very bad. It is asserted that Belcher, Potosi, Challenge, Confidence, Alpha, Ophir, Union, and two other mining companies on the Comstock, will levy assessments next month; while of the outside companies the following will levy assessments: Bodie, Mono, Peer, Del Monte and two others of the Tuscaroras. After the assessments on the shares of the Comstock and outside mines are levied, it is claimed that the stock market will do better, although when first levied there might be a sharp decline. These reports are given for what they are worth, but it is only proper to say that they are more often right than wrong, yet how they will prove now, time can only tell. The manipulators give their tools correct information on a market so as to handle or fleece the public to a better advantage when the time arrives.

From the mines, private advices continue hard to get, which is construed by the better informed to warrant the assertion that the work going on in the leading mines is of a far more important character than the managers wish the public to know. A report is current of an improvement in Con. Imperial. This strike, about 10 feet of ore, was made three or four weeks ago. In the same mine a 5-foot body of ore is reported to have been run into near the Confidence level.

Official advices report that last week in Crown Point in the west crosscut on the 160-foot level, they ran into a narrow streak of ore assaying from \$40 to \$60 a ton. This may lead to something still better. In Crocker an improvement is reported in the west crosscut on both the 500 and 600-foot levels. In Hale & Norcross the improvement noted in this paper is confirmed. Yellow Jacket, Confidence, Challenge, Belcher and Overman deserve close watching.

The work going on in and around the Ward Shaft is of the most important character, and may, sooner than expected, surprise the many. From the North end mines our advices are very meager, yet well-informed, practical miners are very hopeful of the best results in one or more of them. The poor, unsatisfactory advices from the mines confirm the opinion of the better informed that the pool is

gathering in stock, and to do so they will sink prices by degrees as long as they can gather them in.

From the Quijotas, official news continues good—to good for the stock, if we are to judge by the prices ruling for Crocker, Peer and Peerless. From the Tuscaroras our advices are confirmatory of another decided improvement in Del Monte. Commonwealth is turning out large quantities of bullion, which means 50-cent dividends. North Belle Isle has about 1,000 tons of concentrates that assay very high, which will soon be turned into bullion. The work going on in Grand Prize and Belle Isle is of a very interesting and important character.

From the Bodies we are without our usual information. This is probably due to there being no particular change in the mines. Official letters report more miners at work in Bodie, and that exploring and other work on the 700, 800 and 900-foot levels is being vigorously pushed.

Our last private information, part of which was given in last week's PRESS, was of a very encouraging nature, yet usually well informed parties here are afraid that the stringers, etc., report may run into an assessment rather than into ore of value.

The mining share market opened steady this morning under light business. After the 9:30 call there was more activity and higher prices in the Tuscaroras under the leadership of Del Monte, which was soon followed by a better demand for the Comstocks, causing higher prices to rule. The Bodies sold low. The advance in the Tuscaroras and Comstocks was according to street points. After to-morrow the points are for lower prices on the latter. The points out on the Tuscaroras are for quite a setback before there can be much of an upward move.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department to, San Francisco:

NORTHERN DEVELOPMENT CO., Feb. 25. Object, hunting, trading and fishing. Capital stock, \$250,000. Directors—W. H. Ferguson, John Ross, L. W. Johnson, John Sheao and H. M. Scrivenor.

WEST SHORE LAND CORPORATION, Feb. 25. Capital stock, \$250,000. Directors—R. J. Martin, C. McCreary, Robert Mack, D. Hirschfeld, Jules Levy, S. Epstein and D. P. Belknap.

CALIFORNIA WATER CO., Feb. 25 (Oakland). Object, the furnishing of water to San Francisco, San Mateo, Alameda, Santa Clara and other counties, the water to be derived from whatsoever sources may be available to purchase or otherwise; also to secure water rights, by condemnation, to build sites, dams, dam-sites, canals, flumes, etc. Capital stock, \$50,000,000, divided into 500,000 shares. Directors—Ansel M. Easton, James Cunioigham, Albert U. Mills, Montague T. Moses and Nathaniel J. Brittan.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Justice, Feb. 24, \$4495; Con. California and Virginia, 24, \$77,025; Commonwealth, 24, \$31,000; Germania, 18, \$2580; Haouner, 18, \$3100; Germania, 19, \$2319; Hanauer, 22, \$2374; Germania, 22, \$2200.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

R. G. HUSTON—Montana.

THE UNION IRON WORKS' FORFEIT.—The request of the Union Iron Works of San Francisco to be relieved of the penalties accruing by reason of the horse-power developed by the onrizer Charleston falling below the contract requirement, was favorably acted upon by the Senate Naval Affairs Committee. A bill will be reported relieving the company of the payment of the \$33,000 penalty, to which it would otherwise be subjected.

REFRIGERATING

MACHINERY.

Special Machinery to Order.

AERIAL WIRE ROPEWAYS.

(Vulcan Patent System)

SINGLE, ENDLESS TRAVELING ROPE

Elevated on Wooden Posts, from 150 to 2000 feet apart, conveying Buckets of Ore, Coal, Wood, etc.

No Possibility of Load Slipping.

Cheapest Form of Transportation.

No road needed; can be run vertically. No power needed if angle of descent be more than 8 degrees.

CAN SPAN GULCHES 2000 FEET WIDE.

To Miners, Millmen, Dealers in Machinery, Etc.

The undersigned offers for sale at greatly reduced prices, machinery belonging to the

AUTO-PNEUMATIC CAR MOTOR COMPANY,

Situate in the City of San Francisco, on the block bounded by Folsom, Harrison, Sixteenth and Seventeenth Streets. Said machinery is new and has only been used long enough to test every part of it.

One Compound Steam Air Compressor, low pressure cylinder 12x20, high pressure cylinder 5x20, with inter-cooler and all connections comp etc.

One Air Tank, 48 inches in diameter by 16 feet length, tested to 300 pounds to the inch.

One Auto-Pneumatic Passenger and Motor Car, 30 feet long, standard gauge, with air tanks and engines complete. Engines, Compound, 6-inch and 11-inch cylinders by 12-inch stroke.

2000 feet or more of 20 lbs rails with ties, bolts and fish plates, complete.

For further information apply to

J. C. RUED, Director A. P. C. M. Co.,

No. 119 Clay Street, San Francisco.

"RED FLAX CORD"

SQUARE FLAX PACKING,

Manufactured from strictly first-class flax and pure lubricants. Superior to all others for water and steam. Packs with less friction and makes a tighter joint than any other packing made. 25% imitations of inferior quality having been put upon the market, we have been compelled to adopt the above trade-mark, and all of our packing will now have a RED CORD running through the center its entire length. See that you get it and take no other. Sold by all Hardware dealers. Price, 60 cents per pound. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market Street, San Francisco, Cal.

A PARTY WOULD LIKE TO HEAR OF A FAVORABLE LOCALITY

Outside of San Francisco,

To engage in the

MACHINE & BLACKSMITH BUSINESS.

Address "MECHANIC," 419 Folsom Street, San Francisco.

GRANGER'S ROLLER STAMP MILL

Beats them all. Works dry ores. Makes even granulation. No dead work, hence minimum wear.

A. P. GRANGER, Denver, Colo.

GRANGER'S DRY ORE SEPARATOR

The very best. Uses no water. No freezing up. Saves hauling waste. Saves high percentage. Send for circulars.

A. P. GRANGER, Denver, Colo.

THOMPSON BROTHERS,

EUREKA FOUNDRY,

129 and 131 Beale St., between Mission and Howard, S. F.

MANUFACTURERS OF CASTINGS OF EVERY DESCRIPTION.

MINING ENGINEERS.

W. A. GOODYEAR,
Civil and Mining Engineer,
MINING EXPERT AND GEOLOGIST.

Address "Business Box A," office of this paper, San Francisco.

ROSS E. BROWNE,
Mining and Hydraulic Engineer,
No. 307 Sansome St., SAN FRANCISCO.

ISRAEL W. KNOX,
Mining and Mechanical Engineer
AND PURCHASING AGENT FOR

Mines, Mining Machinery & Supplies.

Mines Examined, Reports and Estimates Furnished,
Contracts made, etc.
Office, 237 First St., San Francisco, Cal.

THE RUSSELL PROCESS COMP'Y.

TALCOTT H. RUSSELL, Secretary,
NEW HAVEN CONN.

P. O. Box 486.

TUBBS CORDAGE CO.

(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal.

BUTTE, MONTANA,

The railroad, mining and commercial center of the new State, offers some of the best inducements for investments in

Real Estate, Mines & Mining Stock
of any locality in the Northwest. For particulars address
The Evans-Terry-Clausen Brokerage Co.,
41 E. Broadway, Butte, Montana.

VAN DUZEN'S STEAMJET PUMP

For Water Supply Tanks.
For Fire Pump on Yard or Switch Engines.
For Round House General Work.
For Draining Ponds, Pits, Coffin Bams, etc.
10 Sizes. \$7 to \$75. Thousands in use.
Write for Descriptive Pump Circular, V.

VAN DUZEN & TIFT, CINCINNATI, O.

PARKE & LACY COMPANY

— IMPORTERS AND MANUFACTURERS OF —

MINING, MILL and GENERAL MACHINERY.

ENGINES, BOILERS, STEAM PUMPS,
AIR COMPRESSORS, ROCK DRILLS,
WALL'S CRUSHING ROLLS,
CONCENTRATORS, PULVERIZERS,
TURBINE WATER WHEELS,
ROCK BREAKERS, DRY JIGS.
Bullock's Diamond Drills

GOLDEN GATE CONCENTRATORS,
GREATEST CAPACITY OF ANY CONCENTRATOR MADE,
One Machine Taking Pulp from 10 Stamps.

SAW MILLS, MACHINE TOOLS,
PLANING MILLS, INJECTORS and EJECTORS
BELTING, PACKING, OILS, LUBRICATORS,
FIRE EXTINGUISHERS,
CENTRIFUGAL PUMPS
ROTARY PUMPS, GANG EDGERS,
CAMPBELL'S STEAM FEEDS,
MILL and MINE SUPPLIES.

GENERAL AGENTS FOR

WESTINGHOUSE AUTOMATIC ENGINES.

SALES DURING LAST FOUR MONTHS:

COMPOUND, 44 ENGINES, 5215 HORSE POWER. STANDARD, 99 ENGINES, 4500 HORSE POWER. JUNIOR, 166 ENGINES, 4260 HORSE POWER.

Grand Total, 309 Engines, Aggregating 13,975 Horse Power.

21 and 23 Fremont St., San Francisco, Cal. 189 Clarence St., Sydney, N. S. W.

NOTICE TO GOLD MINERS!
SILVER-PLATED AMALGAMATED PLATES
For SAVING GOLD!
IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER
AT REDUCED PRICES.
Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates Replated, Bought, or Gold Separated. THOUSANDS OF ORDERS FILLED.
SAN FRANCISCO NOVELTY, GOLD, SILVER AND NICKEL PLATING WORKS,
108 and 112 First St., San Francisco, Cal.
SEND FOR CIRCULARS.

JUSTINIAN CAIRE, Agent,
521 & 523 Market St., San Francisco,
—DEALER IN—
Assayers' and Mining Material.
—MANUFACTURER OF—
BATTERY SCREENS AND WIRE CLOTH
Agent for HOSKINS'
HYDRO-CARBON ASSAY FURNACES

IMPORTANT TO GOLD MINERS!
SILVER-PLATED AMALGAM PLATES for SAVING GOLD
IN QUARTZ, GRAVEL AND PLACER MINING.
PRICES GREATLY REDUCED.
Only Refined Silver and Best Copper used. Over 3000 Orders filled. Fifteen Medals Awarded. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated.
These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Sts.
San Francisco Gold, Silver and Nickel Plating Works, 653 & 655 Mission St., San Francisco, Cal., E. G. Denniston, Prop'r.
Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper. SEND FOR CIRCULAR.

F. A. HUNTINGTON,
— MANUFACTURER OF —
CENTRIFUGAL ROLLER QUARTZ MILLS,
Concentrators and Ore Crushers,
Mining Machinery of Every Description. Steam Engines and Shingle Machines.
SEND FOR CIRCULAR.

PERFECT PULLEYS
First Premium Awarded at Mechanics' Fair, 1884.
CLOT & MEISE,
Sole Licensed Manufacturers of the
MEDART PATENT WROUGHT RIM PULLEY
For the States of California, Oregon and Nevada, and the Territories of Idaho, Washington, Montana, Wyoming, Utah and Arizona. Lightest, Strongest, Cheapest and Best Balanced Pulley in the World. Also Manufacturers of
SHAFTING, HANGERS AND APPURTENANCES.
SEND FOR CIRCULARS AND PRICE LIST.
No. 1129 and 181 FREMONT STREET SAN FRANCISCO, CAL.

H. D. MORRIS,
220 Fremont St., San Francisco,
MANUFACTURERS' and PURCHASING AGENT.
Special attention given to purchase of
MINE and MILL SUPPLIES.
ADAMANTINE SHOES AND DIES.—Guaranteed to prove better and cheaper than any others. Orders solicited, subject to above conditions.
H. D. MORRIS.

SOLE AGENT FOR
Adamantine Shoes, Dies and CRUSHER PLATES,
—AND—
Chrome Cast Steel for Rock Drills, Etc.
ADAMANTINE.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$900, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

CALIFORNIA WIRE WORKS

ESTABLISHED 1852. INCORPORATED 1882.

—MANUFACTURERS OF—

Steel Wire Rope,

—OF ALL KINDS FOR—

CABLE RAILWAYS,
ROPEWAYS and TRAMWAYS,
Mining, Shipping & General Purposes.

WIRE,
BARBED WIRE,

Dewey & Co.'s Scientific Press Patent Agency

ESTABLISHED
1860

One 50-ton, wrought iron, water-jacket Smelting Furnace (30"x30" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 28, Elkhorn, Montana.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies the information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

INVENTORS, TAKE NOTICE!

L. PETERSON. MODEL MAKER,

258 Market St., N. E. cor. Front (upstairs), San Francisco. Experimental machinery and all kinds of models. Tin and brasswork. All communications strictly confidential.

THE ROTARY STEAM SNOW SHOVEL—See page 171.

Eye End of the Lick Telescope.

One of the great objects of curiosity to those who visit California is the Lick telescope on Mount Hamilton, which, from its large size, has become famous throughout the world. The steel tube of the telescope is 56 feet long, and

the entire weight of the mounting is 65,000 pounds. The eye end of this great telescope, which is shown in the engraving, is a wondrous combination of intricate and delicate mechanism. One of the observers, notwithstanding his familiarity, says that when observing he can never get rid of the idea that he is seated

THE EYE-END OF THE GREAT LICK TELESCOPE.

in the cab of a locomotive. The eye end is fitted for use with micrometers, spectroscopes, photometers, gears for operating the mechanism, etc., which make it look entirely different from an ordinary telescope. In fact, the large "finder" mounted on top is as high as some observing telescopes. As may be imagined, no one is allowed to handle this instrument except those directly in charge.

piston-like layers, and rising rapidly in the column, does the work of pumping. The water is discharged in alternate layers with the air.

The apparatus tested, was erected without due regard to heat dimensions, and it is deemed proper to state that the efficiencies found could have been increased by a few simple alterations. Pipes of different diameters were not provided, and the experimenters were able to change only the length of the pump column, the amounts of submersion and lift, and the pressure in the receiver, hence the quantity of air supplied.

The diameter of the pump column was 3 inches, of the air pipe 0.9 inch, and of the air discharge nozzle $\frac{5}{8}$ inch. The air pipe had four sharp bends, and a length of 35 feet plus the extent of the submersion. The water was pumped from a closed-pipe well (55 feet deep and 10 inches in diameter) and was discharged into a tank and delivered—over a quadrantal weir—back to the well. A long mercurial column was connected with the receiver for the purpose of obtaining accurate measurement of pressure.

Two methods of ascertaining the quantity of air delivered to the pump were adopted. By the first method, the cubic contents of the receiver was measured. The escape cocks from the receiver were closed and the compressor

(Concluded on page 168.)

POHLE'S AIR-LIFT PUMP.

Superintendents.

A Mining Trip From Yreka, Cal., to Portland, Oregon.

A perilous trip from Yreka, Cal., to Portland, Oregon, was undertaken and accomplished by A. E. Schwatka, an uncle of Lieutenant Fred Schwatka of Arctic exploration fame, during the storms which have recently prevailed in Northern California. The *Morning Oregonian*, Portland, Oregon, Feb. 13th, says: "A good story entitled 'Traveling Under Difficulties' might be written from the experiences of A. E. Schwatka (uncle of Lieutenant Fred Schwatka of Arctic exploration fame), who left Yreka, Cal., January 30th, for Portland to meet Colonel John W. Drew, manager and treasurer of the Rye Valley Mining Co. Mr. Schwatka, although well along in years, is endowed with the characteristic mountaineer hardihood and pluck, and he traveled over one-third of the way on foot. He left with Colonel Drew last evening for the mines, where he goes to assume the duties of superintendent."

"A brief account of his trip and the experiences of himself and a party with whom he fell in at Central Point, may not be uninteresting to the public."

"Mr. Schwatka left Yreka Thursday, January 30th, going by rail as far as Montague, where he arrived at 1 p. m. He then walked to Lairds, a distance of 11 miles, remaining there over night. Friday morning he set out on foot for Hornbrook, at which place he got a horse. He rode to the Lower Coles, a distance of 12 miles, then walked three miles to the Upper Coles, and again put up for the night. The snow was from two to three feet deep and walking was rather a slow mode of locomotion, but the only one available."

"Saturday, Feb. 1st, he left the Upper Coles with a guide for the mouth of the Siskiyou tunnel. Having gone through the tunnel, he took another guide, who piloted him to Delahides, three miles this way. From there he walked to Major Bannon's place, four miles farther, where he arrived at 5 o'clock in the evening. He then got a horse and buckboard and made Ashland, a distance of 17 miles, at 8 o'clock."

"In crossing the Siskiyou, he had to hire a man to break paths and trails, so that he could walk. It was snowing very hard at times, and he could not use snowshoes."

"Sunday noon, Feb. 2d, he left Ashland in a buggy and reached Central Point at 6 o'clock in the evening. Here the water was so high that he could make no further progress and he was obliged to remain until Tuesday evening, Feb. 4th."

"At Central Point, Mr. Schwatka was joined by J. W. Winn, Daniel Sternberg and J. E. Fenton."

"Tuesday evening the party took a hand-car. They had gone only about four miles when they came to a washout nearly 300 feet in length, near Yolo. The track was standing on edge and they had to abandon it. They managed to get their car over the washout, and then ran three miles farther, when their path was again blocked by a landslide. It became necessary to abandon the car, and the party walked four miles farther to Gold Hill, where all approaches to the wagon bridge were washed away. They crossed on the railway bridge, which was in good condition, and from there walked to Woodville, a distance of nine miles, where they arrived at 2 o'clock in the morning."

"Having taken a little rest at Dr. Stanley's hotel, the Rogue River House, the party resumed the journey by foot about 7 o'clock on the morning of the 5th. The 14 miles between Woodville and Grant's Pass, where they arrived at noon, were trudged in a pelting rain. Being weary and footsore, a rest of six hours was taken, and then the party proceeded by hand-car to Tunnel No. 9, a distance of 18 miles. They then walked to Leland, four miles, arriving there at 1 o'clock Thursday morning, February 6th. Here they could not obtain any kind of lodgings. Even the section boss refused them admittance into his house, and they were obliged to pass the remainder of the night in an old dilapidated car side-tracked there."

"A little after 2 o'clock in the morning a feeling of emptiness in the region of the stomach caused them to continue the weary march. After walking four miles, they reached a farm-house, where they were enabled to get something to eat."

"At this point, Sternberg was taken sick from over-exertion and exposure, but would not give up, and he insisted upon continuing the tramp after a short rest. By the assistance of his companions, he was enabled to get to Glendale, which was reached at 12 o'clock noon."

"The party remained at Glendale overnight, and the next morning, having been increased by the arrival of G. S. Miller of Oswego, who joined them, they procured saddle-horses and made Myrtle creek, 30 miles, by 7 o'clock in the evening. They remained there over night, and Saturday morning, February 8th, all started out on foot. They reached Roberts' hill, a distance of 16 miles, at 3 o'clock in the afternoon, and here found a construction train, on which they rode as far as Roseburg. Remaining there over night, they took another construction train Sunday morning, and rode as far as Harrisburg bridge. Here a large washout was encountered, and they walked to Harrisburg, four miles away, arriving there at

5 o'clock in the evening. Three hours later they took a hand-car, and by 11 o'clock they reached Albany, a distance of 28 miles. Albany was left by hand-car by 9 o'clock Monday morning, and Salem was reached at 3 o'clock in the afternoon."

"They remained at Salem over night, and the next morning crossed the Willamette in skiffs. Darry was reached by wagon, and at this point the weary travelers were taken on board of a train. They all arrived at 6 o'clock Tuesday evening, and yesterday spent the day in sweet rest. Mr. Schwatka was on the road 13 days."

"Mr. Schwatka made the entire trip with no load beyond the clothes on his back. Sternberg carried about 50 pounds of sample cases from Medford, and Winn and Fenton each started out with about 20 pounds. Sternberg discarded half of his load at Woodville."

"The wagon-road between Canyonville and Glendale was blockaded with several large slides and trees which had been washed down, and the party was obliged to go around the mountains. For a distance of three miles the snow was knee-deep."

"The waters of Canyon creek were running like a mountain torrent, and the party found it a little hazardous crossing. The horses ridden by Miller and Sternberg stumbled once or twice and nearly precipitated their riders into the maddy water."

"Near Myrtle creek the party had to cross a trestle bridge, nearly half a mile in length, in the night. It was so dark that Schwatka missed his footing and he only saved himself by holding on to his arms. After he extricated himself he concluded that crawling along on hands and knees was the safer method of locomotion. He did crawl, and he crawled nearly 50 feet on terra firma, his hard-hearted traveling companions having failed to notify him that the bridge was passed. The next day Winn fell on a trestle bridge and succeeded in taking off three or four square inches of skin from the left leg."

"On the night of the 7th, Miller fell into a hole, which was covered over with water, and ran a nail through the palm of his hand. He pulled the nail out, wrapped the hand up and pluckily continued the journey."

"The railway men all along the line were very courteous and obliging, assisting the travelers whenever it lay in their power to do so. There was one exception, however. The section boss at Leland even refused to open his door to the strangers."

The facts of the undertaking of this trip by Mr. Schwatka are briefly and simply these: Col. John W. Drew, manager of the Rye Valley Hydraulic Mining Co. of Rye Valley, Oregon, visited San Francisco during January last past with the purpose of securing the services of some competent hydraulic miner to supervise the operations of the placer mines under his management. From testimonials which were furnished to him by the Joshua Hendy Machine Works of this city, who make a specialty of furnishing hydraulic mining machinery, communication by wire was had with Mr. Schwatka, who was at Yreka (railway communication being entirely suspended between San Francisco and that place), and arrangements were perfected by which Col. Drew left here by steamer for Portland, and Mr. Schwatka undertook the trip, as best he might, from Yreka overland to meet that gentleman at Portland. The incidents of the trip are given above, and they bring back reminiscences of the days gone by in the years of '49, when the hardy men of California dared, without a care, to brave the sweltering heats of mountain fastnesses in summer or their avalanches of snow in winter."

Mr. Schwatka has been for many years a resident of Siskiyou county, well and favorably known, and his heroic accomplishment of this journey proves that blood is blood; that the nerve and vigor displayed by Lieut. Fred Schwatka in his Arctic explorations came from his lineage; that he was born of a race of hardy, adventurous men."

A RAILROAD ACROSS SIBERIA is to be constructed by the Russian Government, and Gen. Annenkov calculates that within five years through trains can run between the Baltic and the Pacific. The eastern terminus of the line will be Vladivostok. The development of the valley of the Amoor, and the diversion to Russia of traffic which now crosses the Pacific or passes through the Suez canal, are among the chief gains expected from the Trans-Siberian railway."

PLACERS.—The northern portion of Montana is excited over the unexpected discoveries of placer gold quartz and silver and lead in the mountain spurs and hills of the great reservation, as well as in the belt of mountains. One mine near Maiden is crushing enough rock with a 20-stamp mill to turn out every month \$100,000 in bullion.

A NEW borax deposit was found recently 20 miles from Independence, Inyo Co. The lucky finders took 260 tons from less than three acres of the marsh.

THE Lompoc *Record* says one company of beach miners took out \$1500 worth of fine gold in two weeks recently.

POSTAGE.—There are only nine States in the Union where the postal receipts exceed the expenditures.

Gold Nuggets.

Advices from Charlotte, N. C., state that a gold nugget, weighing 50 pounds, has been found in the Tete Saunders mine in the Uwarle valley, Montgomery county. The mine is practically the property of Senator Jobu C. Spooner of Wisconsin and Senator George Hearst of California, who have an option on the property. The two senators visited the mine with mining experts, and made a thorough examination of the property. They left Dr. Riote of New York in charge, and he immediately began operations. After working nearly two weeks in prospecting, he struck the nugget at a depth of about 16 feet from the surface. The nugget is 14 inches in length, 6 inches in width and 3 inches in thickness.

The following account of nuggets found in California has appeared in print, but we do not know its original source:

A nugget weighing 266 ounces and valued at \$5000 was found at Minnesota, Sierra county.

A gold nugget was found, date not given, near Kelsey, El Dorado county, which sold for \$4700.

In 1854, a mass of gold weighing 360 ounces, and valued at \$6625, was found at Columbus, Tuolumne county.

In the year 1867, at Pilot Hill, El Dorado county, a boulder of gold quartz was found, which yielded in gold \$8000.

In 1849, a nugget was found at Sullivan's Creek, Tuolumne county, that weighed 28 pounds avoirdupois.

In 1850, a piece of gold quartz was found in French ravine, Sierra county, which contained 263 ounces of gold, worth \$4993.

A Mr. Virgin and others found a nugget on Gold Hill, Tuolumne county, which weighed 380 ounces, and was valued at about \$6500.

In 1876, J. D. Colgrove of Dutch Flat, Placer county, found a white quartz boulder in the Polar Star hydraulic mine which contained \$5760 worth of gold.

In November, 1854, a mass of gold was found at Carson Hill, Calaveras county, which weighed 195 pounds troy. This is the largest piece of gold ever found in the State.

On the 4th day of August, 1853, Ira A. Willard found on the west coast of Feather river a nugget weighing 54 pounds avoirdupois before and 49½ pounds after melting.

In 1856, at French Ravine, Sierra county, a nugget was found which contained considerable quartz, but yielded \$10,000, while another was found at an earlier date in 1851, the gold from which was valued at \$8000.

A Mr. Strain found a large slab-shaped gold quartz nugget near Knapp ranch, half a mile east of Columbia, Tuolumne county, which weighed 50 pounds avoirdupois. After crushing and melting, the gold was valued at \$8500.

A nugget of pure gold was found in the middle fork of the American river, two miles from Michigan Bluff, in the year 1864, which weighed 226 ounces, and was sold for \$4204. Another account of this nugget states that the weight was 187 ounces.

The first nugget of any great importance, and which played a prominent part in the early history of California, was found by a young soldier of Stevenson's regiment, in the Mokelumne river, while drinking from that stream. It weighed between 20 and 25 pounds.

A Frenchman found a nugget of gold in Spring gulch, Columbia, Tuolumne county, which was nearly pure gold, being worth more than \$5000. The finder became insane the next day and was sent to Stockton. The French consul recovered the nugget, realized its value, and sent the money to the finder's family in France.

The Old Dominion Copper Company.

The *Globe Silver Belt* (Arizona) says: There is a vague idea abroad that we have a big copper mine up here in this dimple of the mountain, but its real magnitude and value is not fully realized, owing to the remoteness of Globe from the beaten paths of travel, and also for the reason that the owners of the property, the Old Dominion Copper Co., and their local representative, have been conservative in the matter of giving information in regard to their operations. Knowing that the year 1889 was among the most prosperous in the history of the Globe mine, we were prompted to apply to Supt. A. L. Walker for exact data, which he has kindly furnished. From him we learn that during the year there was smelted in the company's furnaces 18,574 tons of ore, and 4159 tons of limestone flux was used. The amount of coke (domestic) consumed was 6,091,410 pounds, and of bullion produced, 5,915,510 pounds, .985 fine in copper. Thus it will be seen that the consumption of coke (no English coke being used) and output of metal was almost equal, pound for pound. The copper produced, too, was of an excellent quality, second only to Lake, and the superiority of the latter is so slight as not to justify the difference existing in price between the two brands. We did not ascertain the exact cost of bullion, but understand that last year it was lower than ever before and so small as to demonstrate the ability of the Old Dominion Copper Co. to compete with any other producer of copper in the United States.

The force of employees was increased during

the year, and there are now 140 names on the pay-rolls. The intention is to keep two furnaces running steadily. A new water-jacket has just been received from Fraser & Chalmers, giving the company a plant of three good furnaces.

A large amount of work is projected for the current season, the most important of which is the further sinking of the main, Interloper shaft, begun last Thursday, and the opening of a 7th level, which will be done as rapidly as possible. Two new cages have been placed in the shaft and two sinking pumps.

The success attained by the Old Dominion Copper Co. during the past season was due in a great measure to the intelligent management of Supt. A. L. Walker and his assistants, N. S. Berry, foreman of the mine, and J. H. Canavan, in charge of the smelter. Their long service with the company has given them that practical knowledge of the business in its every detail, so necessary to success.

Utah Ozocerite.

During the year 1889 the product of ozocerite, or "mineral wax," from the Utah mines was approximately 130,000 pounds, as compared with 65,000 pounds in 1888. The deposit, which covers 5000 acres, has been bought by a New York company. The attention of prospecting miners was first attracted to this curious mineral in Utah by seeing the Ute Indians making use of it in the construction of torches. For this use they wound the wax round a central core consisting of several long reeds or stalks of cane grass, which served as a wick. With a candle of this kind, two feet in length, the Indians were able to travel several miles in the night-time. The miners, from this hint, manufactured candles for use in their cabins, improving upon the Indian article by using strips of cotton cloth for wicking.

The Utah deposit promises to become of great value, as English capitalists have absorbed the Glacial ozocerite-field and raised the price of the article. It is useful in the industries and arts. Recently it has been discovered that ozocerite is the best insulating material known for the use of electricians.

Thomas Parker of this city, says the *Virginia Enterprise*, who prospected extensively in Utah in the early days, says he might to-day be the owner of the whole ozocerite-field had he known its value. He says that he then, in common with the other miners in that region, thought the "stuff" to be merely dried and waxy petroleum ooze, and that probably at depth there were below it large fountains of coal oil.

Mr. Parker relates that on one occasion some miners one night set fire to the ozocerite at a place where great quantities of the substance cropped out from the seams in the slaty rock on the side of a hill. The flames spread rapidly, and soon there was seen pouring down from the hillsides a torrent of melted wax, forming a grand caecode of fire.

The men were for a time afraid they had set the world on fire, and made a rapid retreat to a safe place on an opposite hill, whence they viewed in awe the grand spectacle—a veritable Niagara of fire.

The next morning the fire was out, it having burned down into the interstices of the rock only a short distance. Mr. Parker is of the opinion that in this "miners' freak" there was destroyed not less than \$50,000 worth of ozocerite, as in places on the steep side of the hill it had accumulated in large corrugated heaps, some of which were a yard in thickness. He says that there was at that point more of the wax in sight than anywhere else in the country previous to the experiment of firing it, but the next day little was to be seen except scorched and blackened rocks.

MINERAL SUBSTANCE FOUND IN DRAIN-BOXES.—A piece of sediment was recently taken from a drain-box in a tunnel in the Overman mine that is the exact shape of the box in which it was found, with all sides of equal thickness and as hard as stone. The specimen resembles porphyry in color, and is as hard as the hardest variety of that material. The sediment hardened after the flow of water in the drain-boxes ceased, and is the product of the mineral substances contained in the water. An assay of the specimen showed that it carried both gold and silver, the latter metal predominating. In all underground drain-boxes in old tunnels in Comstock mines the above-described sediment is found, but this is the most perfect specimen yet exhibited.—*Virginia Chronicle*.

SWALLOW-TAILS FOR MINERS.—The wealthy Japanese owner of the Wakeo copper mine, Japan, is about to celebrate in a rather peculiar manner the 200th anniversary of the mine coming into the possession of his family, says the *Japan Gazette*. The celebration takes place about the beginning of March, and on that occasion each of his 300 or more employees will receive as a memento of the occasion a swallow-tail coat. The fortunes of Mr. Smitomo's family were retrieved some years ago by the mine in question, when they were on the decline.

MINER TIMBERING.—A recent experiment to ascertain the difference in cost of timbering a shaft with cribbing or square sets demonstrated that the latter system consumed 115 feet less of lumber than by cribbing for each square set.—*Virginia Chronicle*.

The Supreme Court of the United States.

Among the many centennial anniversaries in this country, none were more impressive than the one recently commemorative of the centennial birth of the Supreme Court of the United States. Ex President Cleveland presided, opening the meeting with a very felicitous speech. The important part this tribunal has taken in the history of our country was duly set forth and landed by several distinguished speakers.

In the current number of the *Forum* is a notable article on the power of this tribunal that is well worthy of serious study. There are few outside of the legal profession that are aware of its unique and tremendous power. There is nothing like it in the judicial system of the world. In the most despotic lands there is no court that has the power to make or unmake constitutional law, limit the prerogatives of the sovereign and control legislation. The form of the government in this court is as clay in the hands of the potter. In the language of this writer, "It has power above that of the chief magistrate of the nation, superior to that of Congress, higher than that of any State and equaled only by that which made or can amend the Constitution. It can enlarge or limit the prerogatives of the President or the power of Congress. It can change the relations between the States and the nation. It can extend or restrain the central power or State sovereignty. In matters of federal concern, it can fix the bounds of the executive or the legislative authority of any State, Federal courts, and on national issues, State courts are ruled by its decrees. In short, it can make or unmake the constitutional law of the country. It can introduce radical changes in our form of government. Not only can the Supreme Court wield these vast powers; it has long done so, and may continue to do so."

This is a fearful investiture of power, and there seems to be no help for it. The Constitution is the supreme law of the land. It is a scheme of government. It enmeshes certain powers with their limits. This is not done in language so exact that there is no chance for mistakes, no room for difference of opinions. The production of such an instrument would have been beyond human foresight and wisdom. The Constitution has never been free from doubt, nor ever will be. Grave questions are ever coming up that must be decided. When there are antagonistic views, who will decide? Are the prerogatives of the President to be fixed by the President? Has Congress the right to construe the Constitution for itself? No doubt of it, unless the power is lodged elsewhere; but it is lodged elsewhere. Under our system the Supreme Court is made the interpreter of the Constitution. Its deliverances are binding on the executive, the legislative department and on every State government. Its decrees are part of the supreme law, a part of the Constitution. What is the Constitution? Just what the Supreme Court declares it to be.

Then whatever judgment this tribunal renders is final. There is no appeal only to the court itself or the power that can amend the Constitution. It may overrule its own decisions. It may change to-morrow the opinion of to-day. It has often done so, but the President, Congress, no State can reverse or modify its decrees.

And this vast power may be wielded by five men, and sometimes even a smaller number. Four hundred representatives of the people in the House and Senate may enact a law, the President may approve of it, the people demand it, but five men in black robes, sitting in a small room of the Capitol at Washington, may quietly set it aside. Three-fourths of the States and two-thirds of Congress may graft upon the Constitution a measure they deem of importance, and five judges may declare it void.

It is true these men are under solemn oath to expound the Constitution. But they are men with like passions and partisan ideas as other men. They are human and often swayed by popular prejudices and convictions. They have no sounder judgment when they put on the ermine than before. The Dred Scott decision was the embodiment of the slaveholders' views of the Constitution, but ten years later the court with a new personnel changed the whole aspect of public affairs. The Constitution was the same in 1867 that it was in 1857, but the difference was in the view of the court. The hundred and thirty odd volumes of the reports of the decision of this court abound with conflicting opinions. It is a chaos that even the genius of Judge Story failed to reduce to order. In hundreds of cases, as in the construction of the Fourteenth Amendment or the legal tender Act, this court has rendered decisions on both sides of the case, and in one instance, at least, must have been wrong.

And this body, with these surprising powers, is appointed by the President with the approval of the Senate, and once in office these men are beyond the control of the President or Congress, beyond even the control of the people, for they are appointed for life or good behavior, and can only be removed by impeachment or the power that made the Constitution. They may retire at 70 years of age, with a continu-

ance of salary, but are not required to do so. Congress may make a law increasing the number of these judges, but cannot reduce their number.

How it Works.

All legislation is experimental. We have a great many fine theories that look well on paper, which when taken out into the field fall to work. They are not adapted to the soil or climate, and have to be thrown into a fence-corner. We have been told, by certain politicians, that the Australian ballot might work very well in Australia and other countries, but it is not adapted to a democratic form of government. Well, it is a rough old saying that the proof of the pudding is in the eating, and we may settle this question in the light of experience.

The Massachusetts Legislature in 1888 passed the Australian ballot reform without any essential modifications, and the law went into operation at the last November election. No expense was spared to give the system a fair trial, and the result has been eminently satisfactory. The chief difficulty was apprehended in large cities, but in Boston, where many predicted a failure, the result was a general surprise. The city was divided into 286 voting precincts, with an average of 176 voters cast at each on election day. The average time required by each voter was about two minutes, and with the ample accommodation afforded, the polls could have been closed within two hours, if all the voters had promptly been at their respective precincts at 7 o'clock in the morning. It is the uniform testimony that at no time of the day had any voter to wait. The expense was less than under the old system.

One of the advantages, it was noticed, of the State's assuming the expense of printing and distributing the ballot, was the increase in the number of independent candidates, many of whom were victorious over the regular partisan nominees. This tendency to independent action will more and more assert itself as time goes on and people break from the thralldom of the political yoke, and surely this is some good. That this method of voting will check bribery and tend greatly to the reduction of the depravity and corruption incidental to voting, seems to be the opinion of the best statesmanship of the country, irrespective of party.

Governor Campbell of Ohio, in his message on the subject, apprehends an evil of as great a magnitude as direct bribery, namely, the refusal of voters to vote for their own party unless hired to go to the polls. He suggests this difficulty may be reached by a compulsory election law with severe penalties. But public opinion would hardly tolerate the enforcement of such a law. It strikes us this evil is largely imaginary. The real crime against free government is not in refusing to vote, but in trying to be paid for doing one's duty as a citizen. It may not be found impossible to provide permanent disfranchisement as a penalty for taking a bribe or seeking to be hired, and that particular penalty the workers of either party could so effectively enforce that not many voters would consent to put themselves in the power of the workers.

At any rate, let us see to it that "the political bosses must go" by this or some other law, and that soon.

CLEANING OIL BARRELS.—The question is asked if coal-oil barrels can be cleaned for meat. A friendly farmer writes: "I have used them for 15 years with perfect success. Knock out the head, set fire to a piece of paper, and put it in the barrel. The fire will burn with a loud roar. Roll the barrel around so it will burn out even, and when it is burned one-eighth of an inch deep, and the barrel up on the open end; the fire is instantly quenched. If it is not charcoaled one-eighth of an inch deep, turn in about a pint of coal oil, roll around until it is spread all over the inside, then fire again. Scrape off most of the charcoal and wash it out. It is not necessary to burn over one-eighth inch deep. I will guarantee there will never be the slightest taste of coal oil in the meat. I have used these barrels for ham, pork, beef, lard and boney. Old musty or tainted barrels I treat in the same way by using a pint or so of oil. Have treated lined oil barrels the same way."

THE UNDER WORLD.—Under the most intense chemical rays of the spectrum ants are thrown into most violent perturbation, while they go quietly about their business under the color-rays. A pistol-shot over their heads causes them not the least disturbance except that which is occasioned by the mechanical jarring of the earth and air; sound, plainly, is not to them what it is to us. It is not their mindlessness that gives ants another world than ours, but the construction of their sense organs.

FUEL GAS PLANTS have become quite numerous during the past year, and when the statistics of the present year have been gathered in, it will be a surprise to most people. Fuel gas is no more a problem, save as to the relative merits of the various processes.

The U. S. Senate has passed the following bills: Increasing the limit of cost for public buildings as follows: San Francisco, to \$800,000; Sacramento, \$300,000; and making an appropriation for public buildings at Los Angeles of an additional \$370,000.

Silver Coinage.

The Silver Coinage bill reported from the Committee on Finance provides as follows:

SECTION 1. That the Secretary of the Treasury be hereby directed to purchase, from month to month, silver bullion to the aggregate amount of \$4,500,000 worth in each instance, at market prices, not exceeding \$1 for 371.25 grains of pure silver, and also to purchase gold bullion as may be offered at the Treasury or any sub-Treasury of the U. S. at a price not exceeding \$1 for 23.22 grains of pure gold; and to issue in payment for such purchases of silver and gold bullion Treasury notes, to be prepared by the Secretary of the Treasury in such form and in such denominations, not less than \$1 nor more than \$1000, as he may prescribe. A sum sufficient to carry into effect the provisions of this Act is hereby appropriated out of any money in the Treasury not otherwise appropriated.

SEC. 2. That the Treasury notes issued in accordance with the provisions of this Act shall be redeemable on demand in lawful money of the U. S. at the Treasury of the U. S., or at the office of any Assistant Treasurer of the U. S., and when so redeemed shall be canceled. Such Treasury notes shall be receivable for customs, taxes and all public dues, and when so received may be reissued; and such notes, when held by any national banking association, may be counted as part of its lawful reserve.

SEC. 3. That the Secretary of the Treasury shall coin such portion of the gold and silver bullion purchased under the provisions of this Act as may be necessary to provide for the redemption of the Treasury notes herein provided for, and any gain or seigniorage arising from such coinage shall be accounted for and paid into the Treasury.

SEC. 4. That the gold and silver bullion purchased under the provisions of this Act shall be subject to the requirements of the existing laws and regulations of the Mint service governing the methods of determining the amount of pure gold and pure silver contained, and the amount of charges or deductions, if any, to be made.

The next section repeals the Coinage Act of February 28, 1875, and the final section puts the Act in force 30 days after its passage.

Long and Short Hauls.

Senator Paddock yesterday introduced a bill to amend the long and short haul clause of the Interstate Commerce Act. This bill repeats, *verbatim*, the original Section 4, forbidding a less charge for a longer haul, except by special permission from the Interstate Commerce Commission. It then provides, further, that in case a complaint shall be made against any transportation company for a violation of that section the Commission shall take into consideration all evidence regarding the character of the products so carried, the cost of transportation, nature of markets and all facts and circumstances bearing upon the question. If it shall find that the merchandise so carried consists of products which are considered among the necessities of life, such as grain or food, and that the conditions of transportation and markets are such that a lower rate for a longer haul may become a necessity to its carriage and a matter of public utility, then it shall consider the case an exception to the general rule provided by the long and short haul clause, and shall make an order accordingly. The long haul, within the meaning of this amendment, shall be 500 miles or more.

The effect of this amendment, if adopted, will be in a great measure to free the hands of the transportation companies. Just to what goods it may prove applicable will be a matter for interpretation. "Necessaries of life" is a term capable of wide extension. It will not limit the application of the rule thereby to "grain or food," but, under the requirements of modern civilization, may be made to include almost anything that does not come clearly under the head of a luxury or superfluity. There is also this radical difference: Under the original law, the companies could not cut rates on long hauls without first obtaining permission from the Commission, and that permission rested with the judgment or caprice of the members. Under the amendment, the companies, without consulting the Commission, can proceed to adjust their long-haul rates to the exigencies of business, and if any complaint is made, and they can show the Commission that the case comes within the provisions of the amendment, then the Commission is legally bound to respect their position.—*S. F. Bulletin*, Feb. 25th.

HARRY HARTLEY, the discoverer of the Meadow Lake mines, is passing the winter there. He lives there alone in the best house in town. The snow is 40 feet deep and he passes in and out of the house, which is two stories high, by means of a trap-door and a ladder.

THE Mount Cory stamp-mill, at Mount Cory, near Hawthorne, Esmeralda county, Nev., is being dismantled. The mill cost \$750,000 and was probably sold for little above what the iron cost used in the construction of the expensive plant.

A PLUSH-COVERED PIANO has been sent from Paris as a forerunner of a fad that may be expected later.

"Only a Poor Miner's Wife."

In all communities are found those who will disagree, and unfortunately Park City is not different from other places in that respect. Two women in the Park recently quarreled over some difficulty that arose between them. One was the wife of a miner, the other of a man who makes his living without coming in actual contact with the pick and shovel, hammer and drill. In their excited debate, the last-mentioned, feeling, no doubt, that the former had overstepped the bounds of caste by being in her presence, let alone preening to question with her, cried out: "And what are you, pray?" and tauntingly added, "only a poor miner's wife." "Only a poor miner's wife," yet within her breast existed courage which she who taunted her could only dream of, for it requires the highest moral courage to be a "miner's wife." Added to her household and family cares, she has, daily, the horrible probability of the support of herself and children being thrown upon her shoulders. Every farewell kiss of the miner husband but reminds his wife that he may return a corpse, torn and bleeding from some horrible accident, mangled by a blast, crushed by a cave, or mutilated beyond recognition by a fall to the bottom of some ralse or shaft. If not so serious, he may return a cripple, with a leg broken, or foot crushed by a falling rock; the blow of a hammer has miscarried, and a crushed hand is the result; a flying piece of steel from the point of a pick or the head of a drill has put out an eye, or some other of the many dangers to which he is exposed has befallen him. Every time the door closes and the husband is off to work, she cannot but think that before the shift is over she may be a widow and her little ones fatherless, left alone to fight the world and its battles. Such thoughts, such contemplations, are not calculated to make the life of the "miner's wife" a happy one, and "her every moment a joy." Yet she is cheerful and exerts every effort to make home pleasant and comfortable, and to banish from her mind the terrible dread of what is almost certain to happen. Could she, who taunted the "miner's wife," be made to live her life for one week, nothing but words of praise would ever again pass her lips. She would realize that among those to be honored for their love, devotion and courage, the "miner's wife" deserves a high place. To all womankind to whom "only a poor miner's wife" applies, we say, "All honor."—*Park City Letter in S. L. Herald*.

Snow Buried.

Eureka hill is buried in snow. The chimneys are spiced to get above the snow and the attic windows are the only means of access to the houses, which are lighted with artificial light day and night. A few have run tunnels in the snow, but they, too, have to be lighted, and most of the people prefer climbing to the natural light, as fuel for lights is scarce. The 20-foot of snow makes no difference to the miners, who work underground, and go to and from the mines on snowshoes. The quartz-mills are built strong and the chute from the upper tunnels to the mill, down in Johnsville, one-quarter mile below, is covered so that the harness of the miners moves along with the same regularity as though there was only a foot or two of snow on the hill. The greatest difficulty for the few miners with families is to find their houses and families after a heavy fall of fresh snow on their return from the mine. The pole they tie the lines to usually has the name of the owner tied to it, but the terrible storms of that high altitude sometimes throw the tag off, or cover both pole and tag deep in the snow. The people of Johnsville, who live immediately under Eureka Hill, are somewhat better off (unless they get an avalanche from the hill), as they only have about 16 feet of the "heavenly." They have hotels and saloons where they can swap "stories" to pass the long, dreary days and evenings during the roaring of the storms. The people of Eureka Hill have neither a hotel nor saloon in which to while away the long evenings, but instead, they go two or three times a week to the public schoolhouse for prayer; so wicked are they that not less than twice a week will give them insurance against the tortures of an imaginary future hell for their imaginary wicked souls.—*Sierra Valley Leader*.

A SNOW BLOCKADE of ore-house sidetracks the greater part of the last week will reduce the February bullion yield of the Comstock mines \$150,000 below the usual monthly average. The tracks are now open and the Carson river mills again in full operation. The only sidetracks kept clear during the recent continued snowfall were those leading to the Con. Cal. & Va. ore-houses, the report of the shipments showing that they reached nearly 3000 tons the past week—which is above the usual average.

The new cantilever bridge across the Colorado river 13 miles below Needles, Cal., will require 3,200,000 pounds of iron to complete it. It rests upon two massive stone piers that are 65 feet below the bed of the river, and the center span is the longest unsupported one in the world—660 feet between the cantilevers. The contractors expect to have the bridge finished by May 1st.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR GOLD MINE.—*Ledger*, March 1: The affairs of this mine have undergone no change during the past week. The miners have not been paid yet, and consequently have not returned to work. It is not likely that either the company or the employees desire to resume operations until all the arrears of wages are settled. A few men are employed in getting the mill machinery in place as fast as it arrives. It is coming in very slowly on account of the bad roads. Only two or three loads of concentrator machinery have come up this week. At the mine only the pump is kept going. We are able to say, however, that the stockholders are fixing up their difficulties, and no doubt everything will be running again in a few days. The men will be paid all that is owing them; there is no question about that. The new superintendent is expected up this week, and will take charge at once.

KENNEDY.—The mill is now running to its full capacity of 40 stamps. The rock is of good quality, and in the deepest levels is met with in larger quantities than above. At a meeting of the directors held recently, John Barton was elected president, in place of T. Varney, deceased; Mr. Belshaw, vice-president; and E. Judson was elected a director to fill the vacancy on the board caused by the death of the late president.

El Dorado.

LOTUS NEWS.—*Mountain Democrat*, March 1: A. J. Hare, superintendent Pine Hill G. & S. M. Co., says: In your issue of Saturday, 21st instant, under the head of "Lotus News" the following item appears, viz.: "The Arthur brothers, Mitchell and James, have relocated a quartz claim, which for the past 20 years has been claimed by Tom, Dick and Harry, and no assessment work done on the same. The above gentlemen while prospecting for the past years for quartz and silver mines, came upon what is known as the Wild Cat mine in Wild Catravine, southeast of Gaylord's bridge on Webber creek and relocated it, and are now busy working the same." Permit me to correct a few errors into which your correspondent has fallen. First, the above-named mine is the property of the "Pine Hill Gold & Silver Mining Co." [Incorporated] and is of record as such on the books of the "Gold Hill mining district" and has been owned by said company since the year 1885. Secondly, your correspondent says that "no assessment work has been done on the mine for the past 20 years." Now if your correspondent would have taken pains to inform himself, he would have found that the company have a double compartment shaft 438 feet and about 25 feet deep, timbered in the most substantial manner—the result of assessment labor, and that during the year 1889 other improvements have been projected, the principal of which has been the opening of a wagon-road leading from said shaft to the Coloma road near Gaylord's bridge, which will enable the company to haul material to and from the mine, which has heretofore been almost inaccessible. The only means of reaching the mine with teams or wagons was by a circuitous route of some six miles of rough and rugged road, while the present road will not exceed one mile in length. The company contemplate the erection of hoisting works on the mine at an early day, and arrangements have already been made with the Pyramid Mill and Mining Company for the crushing of a large quantity of ore as soon as the road can be completed whereby it can be delivered at the mill at a reasonable cost. In short, the assessment work has been done and the mine was not subject to relocation.

A SEAM.—*Georgetown Gazette*, Feb. 27: J. C. Chesrown and George Spencer have been engaged for the past few weeks running on a seam in the long tunnel on the LeBoeuf mine. They have some very good prospects.

Montsrey.

LOS BURROS MINES.—*Cor. Salinas Democrat*, Feb. 27: Los Burros is alive yet, and the fiery, untamed burro is alive and prancing up and down Gold Ridge. The cause of the hilarity is the rich strike made on the Melville mine by Charlie Hudson and Fred Melville. The boys have one of the best mines in the camp. Their vein is in rotten slate and porphyry, and the dirt at the croppings of the vein will average 25 cents to the pan. The Cruikshank's M. Co.'s mill started up again a few days ago. In the mine they have commenced sinking their double compartment shaft from their tunnel level down. It is hoped that the water will not be too much for their present pumping machinery to handle; then we can look for something permanent when their shaft is sunk 250 or 300 feet deeper. The Grand Pacific Co. are pushing ahead their tunnel. They have lately cut a small vein of low-grade ore and are laboring under great difficulties to push their tunnel ahead to the main shaft on account of immense quantities of water coming in. The Grizzly Co. is erecting a 30-foot overshot water-wheel to run an anastha on Alder creek. They are also taking out some very rich ore from their incline shaft. The Manchester tunnel is being pushed with great vigor. Chas. Arrivey is getting some very good prospects on his Atlas mine.

ASPHALTUM AND BITUMEN BEDS.—*Salinas Democrat*, Feb. 23: We were shown yesterday several specimens of asphaltum and bituminous rock, by Dr. H. D. Livingstone of Kings City. The specimens were all in their crude state, except one, and were taken from the claims recently located by the doctor, Isaac Mylar and Thomas Mylar, about nine miles from Kings City. The deposits are on the side of a hill and are practically inexhaustible. Removing the earth, the deposit is found at a depth of about three inches beneath the surface. At places the effects of the sun's heat are seen in quantities of the asphaltum exuding through the crust and from the crevices. Dr. Livingstone showed a beautiful specimen of pressed asphaltum ready for use in paving streets and making roadways. The nearness of the deposits to market and their accessibility over a smooth road, making it possible to draw heavy loads to the railroad, coupled with their volume, makes this a valuable find. The rock can be laid down at the railroad at about \$5 a ton, while Santa Cruz rock sells in the San Francisco market at \$10 to \$12

a ton. Dr. Livingstone leaves to-day for San Francisco to make arrangements to put the product of his mines on the market and endeavor to interest contractors in giving it a practical test.

Nevada.

WILL START UP.—*Grass Valley Union*, Feb. 27: Operations on the Homeward Bound mine, a portion of the Menlo property, are to be commenced forthwith. Some repairs will first be necessary about the pumping and hoisting works, and the shaft will have to be cleared of debris that has accumulated during the time the mine has been idle, but this can be done in a few weeks, when regular underground work will be started. John Rawling will be the foreman of the mine.

PROMISING OUTLOOK.—*Grass Valley Tidings*, Feb. 25: Operations at the Crown Point mine have been vigorously pushed right along through this last storm, water for power being derived from Wolf creek. The shaft has been put down 80 feet by the bondees, giving a total depth of about 380 feet. The ledge is in the footwall, but as numerous good-looking stringers are cut weekly in the shaft, it is thought the vein may be found in the hanging-wall before the contractors complete the next 20 feet of shaft. It such should not prove the case, a crosscut will be run to the hanging-wall and the ledge uncovered. The outlook is regarded as promising.

MENLO.—Mr. John Rawling, who has been appointed superintendent of the Menlo mining property at Allison Ranch, under the bondees, is already arranging for the prompt performance of the preliminary work. The pumps will be in operation in two months or less and at least \$3000 per month is to be expended under the bond.

CROWN POINT.—*Grass Valley Union*, March 2: The crown wheel of the pumping machinery of the Crown Point mine broke on Wednesday and repairs upon it were not completed until Friday night. In the meanwhile the water raised in the mine to an extent that will require four or five days to reduce it. Some good-looking quartz is found in the ledge in sinking the shaft, which prospects in gold, and gives encouragement for the next level that is to be opened.

HARTERY.—Mr. A. W. Stoddard has resigned the superintendency of the Hartery mine and Stephen Fowler, who has heretofore been acting as underground foreman, has been selected to succeed him. Mr. Stoddard yet remains as president of the company and retains his interest as a stockholder. The mine is in good condition, the ore being of high grade, as was shown by a recent crushing, and the company is virtually out of debt. As an undeveloped property the Hartery is giving most excellent promise of becoming a valuable mine.

NEW MINES.—*Grass Valley Tidings*, Feb. 26: Six months hence the storm and its effects on business will have been all but forgotten. The list of our mines of last year will by that time be swelled by six and perhaps seven, for the increased number of men that will be employed at the Coe, Peabody, Hartery and Crown Point will justify us in claiming those properties as new mines. Then there are the Menlo and Gold Hill properties, with perhaps the New York Hill. In any event the Gold Point will make the seventh and add a new mill. Street talk has it that Mr. Fillmore, formerly foreman at the Omaha and now in Monterey county, will return soon to take charge of the Gold Hill. The Idaho, North Star, Omaha and Empire mines may be set down as dividend-payers this year, and we would not be surprised if the North Banner was added to the list.

HARTERY CLEANUP.—The last of the ore at the Hartery (Larimer) mill was run through the stamps, and the cleanup made Tuesday. With the partial cleanup of last week included, an average of between \$35 and \$40 per load for the entire crushing was realized. The pump is holding the water in the shaft without difficulty, and could wood he had the miners could go to work and hoisting be resumed. Under the circumstances, however, development work cannot be prosecuted for a week or more.

QUARTZ.—*Grass Valley Tidings*, Feb. 28: We were shown to-day some handsome specimens of gold quartz taken from a winze in the Knights of Malta (St. John's) mine, at a point too feet from surface, a number of years since. The ore is sprinkled with gold in sulphurets and galena. In conversation with Mr. Dewar we learned that the new company formed to operate this mine have disposed of all the stock desired to be held at present, the investors including residents of Grass Valley, Marysville, Sacramento, Visalia and San Francisco. A boiler and engine have been secured and paid for, negotiations for a pump are under way and building material has been contracted for. As soon as the snow disappears, work will be commenced, with L. M. Carr as the builder, in all probability. One of the old shafts may be utilized, but it is more likely that a new one will be put down.

Placer.

EUREKA.—*Placer Argus*, March 1: We mentioned last week that F. Chappellet had resigned his position as superintendent of the Mayflower mine. He still retains charge of the Live Oak and has been chosen superintendent of the Eureka mine. The Eureka Mining Co. has been organized with the following directors: F. Chappellet, H. Barroillet, J. Morizio, Anthony Clark, J. C. Plunkett, W. H. Rabe is secretary, Belloc & Co., treasurer, and F. Chappellet, superintendent.

IOWA HILL.—*Cor. Placer Herald*, March 1: The Waterhouse and Dorn mine has been shut down for a few days past, on account of an insufficient supply of water to run their machinery, the ditch having been broken near the head during the storm. The Morning Star mine force has been laid off, most of them also lately, but I hear they will soon resume work. At the Pioneer a force of men has been driving the main tunnel ahead to connect with the Lynn ledge; whether they have succeeded or not I do not know. A sad accident occurred at the Red Point on Saturday night. A large slab of the roof, some 50 feet in length, fell and caught several of the men, killing George Patrick and four Chinamen. Mr. W. James, Fred Snyder and G. W. Snyder's nephew were also caught, but I believe none of them were seriously injured, Fred Snyder being badly bruised. It is believed that death was instantaneous in the case of George Patrick.

Santa Barbara.

COAL.—*Santa Barbara Press*, March 1: P. Montanaro has discovered a vein of coal of the best

quality in the San Rafael mountains, a short distance from Santa Ynez, and has already been offered a large sum by rich parties for the mine if it proves to be a paying institution. These mountains surely contain coal, and if Mr. Montanaro has discovered the right place it will not be long before Southern California will come to the front as a coal-producer.

BEACH MINING.—*Lompoc Record*, March 1: The Woods Brothers, of Santa Cruz, have at the Lompoc Landing all the machinery necessary to work the beach mines successfully. The process is said to save all the gold wherever this apparatus is in use. We will probably have a practical demonstration of what this new invention will do, as there are several claims that can be had on fair terms. Mr. Woods informs us that he can put through from 40 to 50 tons per day. It is estimated that \$3 can, with washing that will save all the gold and platinum, be extracted from every ton of sand. The total expense of securing and putting through this machine 50 tons is about \$1 per ton. It will be seen that at a yield of \$3 per ton, there is a fine margin of profit when worked on the scale of 50 tons per day.

Shasta.

NEW MINING ENTERPRISE.—*Redding Democrat*, Feb. 26: Mr. O. J. Johnson, president of the Eureka Tellurium G. M. Co., states that he is expecting a party from the East who is connected with the Elgin, Ill., Reduction Works, to look over the Eureka property. The Elgin Reduction Works Co. has made an offer to put a plant on this property if, upon investigation, it is found as represented, and we shall in the near future see a plant erected at Salt creek for the reduction of the tellurium ore and other refractory ores that may be brought to the works from any part of the county. Bids will be received by the Eureka company for the construction of a tunnel about 600 feet long. The Anavena company proposes to run a tunnel three-quarters of a mile in length on their property at or near Clear creek, in the Muletown mining district, and we judge from the interest taken in these mining enterprises that thousands of dollars will be spent the coming summer by the Anavena, Clear Creek and Eureka Tellurium G. M. companies in erecting reduction works and developing their mining property.

LOWER SPRINGS.—*Cor. Redding Democrat*, Feb. 26: Mr. Comins of Red Bluff came up to Kempton's mill, on Salt creek, on the 16th, and took his portable engine from the wrecked building and will move the same back to the Bluffs. Some time last fall McCort of San Francisco leased the engine from Comins to supply power for the mill. McCort had no capital to go on, consequently the mill was shut down. The Russell furnace still remains in place with no perceptible damage from the fallen building. The long-delayed six-foot Pelton water-wheel arrived at the G. M. and will be running by March 1st. Mr. C. Olmstead has gone to Illinois to raise capital for the necessary improvements in and about the works, so as to begin with firmness and establish a reputation that will make it a creditable mill, suitable for both rebellious and free-milling ores.

"OLD DIGGINS."—Mr. Scharard, a mining man of the southern part of the State, has taken hold of the old Reid mine on Star gulch, Old Diggins district, and intends to sort and ship ore. There is a good body of rich refractory ore in sight in this mine that will pay well to transport.

FROM ONO.—*Cor. Anderson Enterprise*, Feb. 27: A mine at Sunny Hill, known as the Big Charley mine, was bonded from Valentine Doll and Manual Leffler one year ago this month by the Bell Bros. for \$10,000, since which the money has been paid according to agreement. Doll & Leffler receiving \$3333 33, or one-third each of the money. Who got the other third is not known. They have a tunnel 400 feet in length through rock to strike the ledge; have on the dump about 30 tons of ore for shipment which will be hauled to Anderson as soon as weather will permit. A team went to Sunny Hill yesterday with a complete outfit of blacksmith tools for Bell Brothers.

Siskiyou.

BIG DITCH.—*Yreka Journal*, Feb. 26: Some four or five Portuguese companies at Hawkinsville having leased the Big Ditch, commenced work on the same last Wednesday, to put it in good order and build new flumes, etc. They received assistance from business men in Yreka to the extent of \$200, and other assistance from parties in the vicinity who are interested in the development of the rich mining ground at Hawkinsville and on Yreka flats, not worked for some years past on account of scarcity of water. A force of a dozen men started out to the Forest House creek, five miles south of town, last Wednesday, well supplied with provisions, to camp out on the ditch in the work of repairing it in first-class order from that point to Shasta river, as there will probably be water enough from that and other streams and gulches in Yreka basin to keep up a supply nearly all summer for mining. When the supply gets short toward fall, the ditch will be put in order above the Forest House creek so as to gain a supply from Shasta river. The miners on Canal, Long, Humbug, Spring, Portuguese, Greenhorn and other gulches in the Humbug range along the west side of town, are all busy now while the snow lasts in furnishing water to rake in all the gold-dust possible, this being the first season for many years that a good supply of water has been afforded above the level of Yreka flats and the Big Ditch. There is some very rich paying ground in all the above-named gulches clear to the summit of the mountains not accessible with wagons for hauling the pay gravel to water. On Humbug creek the miners are making preparations to rebuild the badly demoralized wagon-roads leading from their quartz ledges to mills, as soon as the deep snow melts off sufficiently to permit. At present they have only a pack trail dug out for temporary use in getting supplies. The hydraulic miners have commenced fixing up their ditches and will have sufficient water this season to continue work with their giants nearly all summer. The sluicing out of the streams and opening of deep cuts in the mountains will give prospectors a splendid opportunity during the coming spring and summer to hunt for good mines, especially in the districts all along the Humbug range and Klamath river, where the forest fires of last summer laid the country bare. The quartz ledges lately discovered on Humbug creek, now turning out so rich and permanent, will cause many old miners to start out on prospecting tours just as soon as the snow is off the mountain-sides to permit of prospecting with success. A correspondent of the Scott Valley News

says the laboring population of Happy Camp has been very profitably employed for about three months working on bedrock belonging to Camp & Co., and which has never been thoroughly cleaned. In some instances a single workman has taken out as high as \$20 a day, and nearly all have averaged a large percentage on the amount of labor expended.

MINING AND FARMING.—Hugo Miller, who owns the old Koester place or orchard at Hawkinsville, on Yreka creek, is having it seeded with alfalfa, and also intends planting a portion with a large number of fruit trees. Next year Miller expects to work the creek portion of the land for gold mining, and has a mammoth pump with a 6-inch discharge pipe capable of keeping the bedrock clear of water, and at the same time supply sluice-boxes with sufficient water for washing the pay gravel raised by derrick. The pump and derrick and other apparatus necessary can all be worked successfully by a stout little steam engine.

SCOTT BAR.—*Yreka Union*, Feb. 27: The Quartz Hill Co., at Scott Bar, have resumed work in their mine at that place. They are at present repairing damages to their ditches and flumes, which were considerably demoralized by the late storm. The San Jose Co., at the same place, are also engaged in cleaning ditches and getting everything in readiness for this season's run.

Sonoma.

QUICKSILVER.—*Sonoma Democrat*, Feb. 27: R. E. Lewis, superintendent and one of the principal owners in the Great Eastern Quicksilver mine, near Guerneville, called in to see us on Thursday. We learn from him that the Co. is now working about 50 men and shipping an average of about 120 flasks of 75% pounds each of metal per month. There has been a gradual advance in the price of quicksilver for three years past and the metal is now selling at \$48.50 per flask. The Great Eastern is the only mine in this county that has been run continuously since its opening. It was located by Mr. Lewis in 1872 and patented in 1876. The original owners, all of Healdsburg, leased it to Thurocio Parrott for 12 years. For the last five years the owners have conducted the mine, with Mr. Lewis as superintendent, on their own responsibility. At \$1 per share the mine paid last year a dividend of 26 per cent on the capital stock. The Co. is burning about 16 tons of ore every 24 hours, which yields four flasks per day, equal to about 1 1/2 per cent. Few people are aware that we have such an important mining industry permanently operated in this county. The officers of the company are Richard Abbey, President, R. E. Lewis, Vice-President and Superintendent, and Alfred Abbey, Secretary and Treasurer.

Trinity.

JUNCTION CITY.—*Trinity Journal*, March 1: J. C. Wallace was in town Wednesday and gave us the following items: Geo. Chapman started up his hydraulic claim last Monday. The Sheridan brothers are also running their claim. With this exception no mining is being carried on there at present. Most of the mines in that vicinity have considerable work to do before they can run. Mr. Wallace thinks that when the mines start the season will be favorable for them; that a large amount of dirt will be moved and a good deal of money will be taken out. W. C. Given is at Cox bar, putting in a dam for Bigelow & Jordan to replace the one that broke last winter. D. B. Gray, the mail-carrier between Junction City and New River, says that the dam across the Trinity river, formed by the slide at Dixon's bar, will be permanent. The water is now backed up several miles and near the dam 30 feet above high-water mark and almost as still as a millpond.

QUARTZ.—Eight quartz location notices were filed in the Clerk's office this week for recording. The ledges are at the head of Rock creek on the divide between Eel and Mad rivers. This is a new region for quartz and we hope the locations will turn out well.

Tulare.

QUARTZ.—*Visalia Delta*, Feb. 20: J. F. McKemie, one of the owners in the Coronado quartz mine, situated on the south fork of the Kaweah river, has just returned from the mine bringing with him some fine specimens of quartz. He showed us one piece of ore weighing nearly 40 pounds that was nearly pure sulphurets, bearing both gold and silver. The owners have a blacksmith shop and plenty of tools on the ground ready to commence work. J. C. Swickard, the superintendent, will start to the mine from Visalia with a supply of provisions, men, etc., as soon as the weather will permit. Mr. Swickard says they have thousands of tons of as good rock as McKemie brought down.

NEVADA.

Washoe District.

OPHIR.—*Superintendent's Report*, March 1: On the 1300-foot level from the end of the east crosscut from the shaft station a south drift is advanced 420 feet from the end of the east crosscut, continuing in porphyry and quartz showing some value.

CON. CALIFORNIA AND VIRGINIA.—The 1300, 1435, 1500 and 1600-foot levels continue to yield the usual quantity of ore. On the 1200-foot level the south drift is extended 70 feet. On the 1650-foot level the raise above the end of the east crosscut from the end of the north drift from the winze sunk 60 feet below the end of the south drift is carried up 60 feet and has been connected with the east crosscut on this level. We are stopping ore from this raise 20 feet below the point of connection. Owing to the snow blockade on the Virginia and Truckee railroad, ore shipments to the Eureka and Morgan mills were suspended and the mine closed down for two days, as the ore-house bins were full. We have resumed operations in the mine and ore trains are running regularly. We shipped to the Morgan mill 707 tons and 440 pounds of ore, and to the Eureka 992 tons and 1000 pounds, battery sample assays showing an average value of \$26.10 per ton.

IMPERIAL.—On the 300-foot level west crosscut, No. 2 continues in porphyry and quartz. The 500-foot level west crosscut is still in quartz. The 300-foot level north drift is out 1420 feet from the Yellow Jacket shaft.

OVERMAN.—We shipped 87 tons of ore during the week, battery sample assays showing a value of \$15.54 per ton.

SAVAGE.—We shipped 445 tons of ore, showing an average value of \$24 by battery sample assays. Bullion is on hand to the estimated value of \$22.

684.80. A 300-foot level south drift is being advanced from the top of the raise above the 400-foot level.

HALE AND NORCROSS.—We shipped during the week 735 tons of ore. The 300-foot level east crosscut has reached the hanging-wall. A raise above the 600-foot level at the Savage line is showing fair-grade ore.

CHOLLAR.—The Nevada mill stamps were hung up Thursday, on account of an accident to the supply flume. The mill will resume crushing ore to-night.

POTOST.—The raise above the 930-foot level is showing ore in the top assaying from \$25 to \$30 per ton.

OCCIDENTAL CON.—We continue to extract ore of good quality from the slopes on the 400 and 450-foot levels. The raise 100 feet south of No. 3 raise is up 42 feet, and continues in fair-quality ore. The 550-foot line, east crosscut, is advanced 11 feet in porphyry and clay. A south drift from the end of the line, west crosscut, is extended 7 feet in porphyry and pay ore.

SEG. BELCHER.—The 1200-foot level north drift from the winze is cutting ore of fair grade.

JUSTICE.—During the week we crushed 200 tons of ore, battery sample assays averaging \$30.82 per ton.

ALTA.—We crushed 325 tons of ore during the week, battery samples showing an average assay value of \$25.50 per ton.

Eureka District.

TRANSPORTATION OF PRODUCTS.—Eureka Sentinel, March 1: During the month of January the E. & P. R. R. Co. shipped over their road 194,820 pounds of ore from the mines of this district, and 210,000 pounds of lead from the Eureka Con. reduction works. During February they shipped 512,708 pounds of ore. There are 15 carsloads at the depot ready for shipment, and there would be considerable more but for the want of sacks, which are very slow coming in. The canyon roads are still filled with snow, and hauling over most of them is retarded. The roads to the Hamburg and Dunderberg mines have not been opened for the season. For these reasons the ore shipments have been very light for the past two months. During the present month (March) the ore shipments will doubtless be greatly increased, and we expect that there will be more ore shipped over the railroad alone this year than the entire production of 1889 amounted to.

DIAMOND ORE.—The Diamond mine on Prospect mountain has yielded well, even with the small force of men employed there during the winter. Charley Broy has been hauling as steadily as the head state of the roads permitted, and last Wednesday night he put on an extra team to sled the ore from the mouth of Goodwin canyon to the railroad depot. He will continue running both day and night as long as sledding remains good. From 8000 to 10,000 sacks of Diamond ore have accumulated at the depot and mouth of the canyon, which will be shipped to Salt Lake as rapidly as possible.

Pioche District.

STARTED UP.—Pioche Record, Feb. 22: The concentrators at the reduction works started up Tuesday afternoon and are running along smoothly. They are running on Half Moon ore and the concentrates are of a high grade. There is enough ore on hand to keep the concentrators running steadily until the company commences hauling ore from the Half Moon.

Robinson District.

MINES BONDED.—White Pine News, Feb. 22: J. N. Hodges and E. K. Walbridge of Pittsburg, Kansas, have this week taken the initial steps toward securing some valuable mining property in Robinson District. The following papers have been filed by them in the Recorder's office: Watson & Brown bond to Hodges & Walbridge the Rob Roy and Little Bonanza mines for \$50,000. Conditions: First payment, March 1st, \$10,000; April 1st, \$10,000; May 1st, \$5,000; June 1st, \$10,000; and August 1st, \$33,000. Watson & Brown bond to Hodges & Walbridge the Nieta, Carl, Comstock and Exchange mines. Agreement bond—\$5000 to be paid June 1st for 6-10 interest in said mines, the bonding parties to have a ten-stamp mill completed on one of the said mines on July 1st and to own a 6-10 interest in the same, the other 4-10 to belong to Watson & Brown. W. R. Thomas bonds to Hodges & Walbridge the Mohawk and Robust mines for \$24,000. Conditions: May 1st, \$10,000; June 1st, \$3,000; July 1st and August 1st, \$10,000 each. The same parties have bonded the Golden Revenue and Red Hill mines from R. M. Peters and J. B. Simpson for \$5,000, to run until June 1st. The Ely Gold Mining and Milling Co. have also bonded several mines and their leased mill and water rights to Messrs. Hodges & Walbridge for \$65,000. The other conditions of the bond we did not learn. While the Kansas party has got hold of some very valuable mining property, it is by no means the pick of the camp, and others who wish to look over the district can find equally as promising ground outside of the Big Joanna Bonanza.

Taylor District.

FAVORABLE.—White Pine News, Feb. 22: Wm. Read, superintendent of the Eberhardt-Monitor mines, was in Ely Thursday. He informs us that the prospects of the company the coming season are very favorable.

Tuscarora District.

NEVADA QUEEN.—Times-Review, Feb. 28: North gangway from the 600-foot level station has advanced 22 feet. The flow of water continues, and has stopped the overflow from the winze on the 400-foot level.

NORTH BELLE ISLE.—South drift from station crosscut, 300-foot level, extended 16 feet. South intermediate, above same level, extended seven feet and connected with No. 4 chute. Have started to follow the main portion of the vein, which is found to be in the hanging-wall in front of the stopes at No. 4 chute. North gangway from the 600-foot level extended 22 feet. The quality of the ore in the face is improving very fast.

BELLE ISLE.—The crosscut from the 350-foot level extended 12 feet; rock very hard in the face with strong flow of water.

NAVAYO.—Air connection has been made with the raise from the 150-foot level and good ventilation will now facilitate prospecting at this point. No. 2 crosscut, 350-foot level, extended nine feet, showing spar seams giving low assays.

NORTH COMMONWEALTH.—1st level: North

drift from No. 1 crosscut is in 13 feet, exposing high-grade ore three feet thick. South drift from joint crosscut has been run 14 feet, and is developing a fine body of rich ore; average assay from car samples \$383.07 per ton. 2d level: Joint crosscut advanced 19 feet through the same formation as on the 100-foot level before reaching the ore.

GRAND PRIZE.—400-foot level: Face of north crosscut advanced 10 feet, cutting stringers of ore.

DEL MONTE.—1st level: North drift from No. 2 crosscut extended eight feet showing good ore very near hill size of drift. North drift from joint crosscut extended nine feet; face continues all in good ore; average assay car sample, \$287. Drift does not take all the ore, as it shows on both sides. 2d level: Joint crosscut extended 10 feet, cutting small seams of spar and pyrites. 3d level: North drift from joint crosscut advanced 11 feet through low-grade ore, with slight flow of water.

COMMONWEALTH.—1st level: East drift from No. 1 north drift has been extended 8 feet; ore 2 feet thick; getting wider as the drift is advanced. 4th level: North gangway extended 15 feet without change; north drift from south gangway has been run in 10 feet, face being all in ore, some of which is high grade, average of first-class \$326.89 per ton. The stopes throughout the mine continue to look well. Hoisted during the week 950 tons of ore, all of which has been sent to mill and concentrating plant. Average battery assay at the mill \$250.63 per ton; average at concentrators \$17.85 per ton. Billion shipment for the week, \$48,788.11. Everything working well.

ARIZONA.

NEARLY FINISHED.—Mohave Miner, March 1: The Atlantic Mining Company's mill, Wallapai mountains, is nearing completion. John Sandoval is taking out some good ore from his claim near the C. O. D. mine. Jack Thomas and M. W. Harvey are taking good ore from the Prince George north, Stockton Hill. Tom McMahon will soon make a shipment of high-grade ore from the Prince George south, Stockton Hill. Work is progressing steadily at the Green Linnet mine, Union Basin. It will not be a great while before a mill will be erected. J. M. Owen has made a discovery at the head of Crow canyon, in Cedar district, which promises to prove valuable. The croppings are very rich in horn silver. W. W. Clark and S. A. Tyler, lessees at the C. O. D., have ready for shipment 180 sacks of ore, which is of good grade, besides a carload to assort. They have a nice bunch of ore in sight in the mine, which they will lose no time in extracting. The Kingman Sampling Co. intend to build new works west of the water tank, opposite the Arizona Sampling Works. The present ore floors are entirely too small to handle the large quantities of ore coming to them. The new works will possess a larger crusher and be driven by steam. E. F. Thompson has a force of eight men employed in the Empire No. 2, Chloride. There is opened a block of ground 100x50 which will be immediately stope, and as the ore body is 1½ to 4 feet in width, large and regular shipments are expected from this property. Steve Hinkle made a shipment last week from his Retort mine, Mineral Park, which worked nearly 400 ounces silver per ton. The last two years Mr. Hinkle has spent in the southern part of the Territory, but about two months ago he returned to Mohave county, and considers it the best mineral belt in the Territory.

COLORADO.

RED ELEPHANT.—Georgetown Courier, Feb. 27: The Red Elephant mine is reported to be again in bonanza. A foot of \$500 ore has been struck in the lower level on the Swartz shaft. Mr. Daily, the superintendent, whom fortune has favored in all his mining undertakings, is, we understand, the principal lessee in developing the ground in which the strike was made.

LESSEES.—Three sets of lessees are operating on the Burrell, each making about \$5 a day to the man. The last millrun by Simmons & Stanton returned 3 4-10 ozs. gold, 45 ozs. silver per ton and 7 per cent copper. Dan Forrest's lease opened out into an 8-inch streak of solid mineral last week. The company continues sinking the shaft, which is now about 150 feet deep.

OIL.—A Pittsburg syndicate is leasing the land about Morrison, Jefferson county, for a long term of years, for the purpose of sinking oil wells. It has long been supposed that oil can be found in paying quantities, as frequently the sandstone is thoroughly saturated with petroleum. It is the intention of the syndicate to commence sinking several wells as soon as the land is secured, and if necessary, go to the depth of 3000 feet.

DEMOCRAT MOUNTAIN, which has long been in the slough of the dumps, is beginning to cheer up the hearts of the miners who have staid by its mines through the years of depression. Sheets & Co., who have been pegging away for three years with but one small pocket of ore during that time which paid for their salt, are making large shipments of an excellent grade of ore. L. E. Davis on the Silver Glance, is also in good ore, and has had several excellent runs. The tide which has been against P. McNulty for these many years is beginning to turn, and the Fred Rogers bids fair to come to the front again.

DAKOTA.

CHLORINATION.—Deadwood Pioneer, Feb. 26: It has been practically demonstrated that the Black Hills refractory gold ores can be successfully and economically treated by a process of chlorination. This was proven to the satisfaction of every one interested by operations last fall at Keith's Garden City plant. Col. Carpenter's works are just completed in this city, and not later than March 1st will be in full operation on ore from the Golden Reward mine, Bald mountain. Col. Carpenter does not claim, nor does he expect to be able, to save what silver the ores may contain. He does calculate, however, on saving from 85 to 90 per cent of the gold assay value of the rock treated. The process to be applied is that covered by the Newberry-Vautin patents.

IDAHO.

TWO BIG DISCOVERIES.—Elmore Bulletin, Feb. 22: The crowning event of the week has been the

rich discoveries made in the Republic and the Lost Lode mines. Eugene Lison, the owner of the Republic lode claim, the eastern extension of the Ophir, has encountered in the crosscut recently driven, about six feet of \$100 rock. The vein is well defined and gives every evidence of permanency. This, together with the developments on the western extension of the Ophir, prove beyond a doubt the absolute continuity of the vein for at least 4000 feet. The owners of the Lost Lode, the western extension of the Queen Bess mine, have also abundant cause for rejoicing. Ten feet of \$30 ore he voluntarily swears to, and with slight urging very readily increases the width of the lode to 15 feet, and the value of the quartz in proportion. The owners of the Queen Bess naturally feel much elated over Patterson's success, and it is in truth a cause for mutual congratulations. The reward for pluck and hard work in the above instances is well merited, and these new discoveries will help to swell the mining boom that is sure to strike Rocky Bar early in the coming summer.

STRIKE IN THE GOLD HILL.—D. R. Dealy, foreman of the Gold Hill mine, owned by the Pine Grove Mining Co. of St. Louis, writes a few lines to the Bulletin saying that they had cut a big and rich ledge in the lower tunnel of the Gold Hill, at a depth of 500 feet. It is four feet wide and all high-grade ore, running from \$100 upward to the ton. Mr. Dealy thinks the point where they made this strike is nearly underneath the shaft sunk last winter. The Pine Grove Co. allowed its mill and mines to be sold for taxes (subject to redemption of course) and since then attachments to the extent of \$2581.25 for labor, have been placed upon the property. This recent development will doubtless cause the owners of the mine and mill to redeem the property sold for taxes, pay off their laborers and make a new start for the hidden wealth in their claims.

CEUR D'ALENE.—Wardner News, Feb. 22: It is pleasing to note the many marks of preparation visible on every side for the active campaign of the coming season. Ceur d'Alene will be a little world of itself, eagerly sought for by ambitious travelers. Aside from the continued and increased development of our present producing mines, others will come to sight in rapid succession instituting a pleasing rivalry with their older neighbors. Ponderous machinery will be brought from all directions over our lines of travel and all the necessary and modern appliances will be introduced in all our working mines, electric lights will constitute one of the many improvements, and the new drill, operated by electricity, will be added to the prospector's outfit, as the power to operate it can be carried easily and inexpensively to all points where its service is required. Numbers of hoisting plants are already ordered and the building of concentrators will commence with the opening of spring. The dam of the Bunker Hill & Sullivan Mining Co., at the mouth of Elk creek, was finished on Thursday. A small force of men is still working on the flume.

LOWER CALIFORNIA.

ALAMO.—Lower Californian, Feb. 28: A complete Wiswell quartz mill arrived on the Newbern yesterday from San Francisco for W. S. Kerr and son, of Alamo. Col. Lucas is about to start up his mill in Mexican Gulch on 200 tons of ore from the Centipede, Visnagre, Bennett's Granite Mountain mine, and Nuestra Señora de Guadalupe mine. They are all located in the Gulch and are said to be good properties. Most of the mines at Mexican and American Gulches have been neglected in consequence of the rich inducements offered at Alamo. But Mexican Gulch is all right and some good reports can be expected from there. The big pump for the El Paso Company has arrived and will be put to work on the El Paso mine. This company's mill is running steadily and must be turning out considerable gold. Thirteen tons of ore from the Aurora mine, run through Lane's mill the other day, yielded \$500. Lane's mill has been grinding on rock from the Aurora mine, of which Postmaster Gonzalez is superintendent and part owner. Many of the boys are sailing close to the wind these days, with bacon, beans and flour. Potatoes are away up to 10 cents a pound. It costs you 50 cents to handle a pound of salt junk or bacon. Hay is \$100 a ton, and tallow, three pounds for a dollar. Crackers, three pounds for a dollar. Eggs, 75 cents a dozen. Flour and fresh beef are the cheapest things in the camp. Competition has reduced the price of flour to \$8 per 100 pounds for best Ensenada, and \$7 for No. 1 Ryerson.

MONTANA.

THE MOODY AND SANKEY.—Inter-Mountain, Feb. 27: The extension of the bond on the Moody, Sankey, Kossuth and Iowa claims, in the Independence district, is an extension of six months on the original bond. These properties are being developed under bond by a St. Louis syndicate, under charge of Major B. J. Fine. There are three veins on the properties, the Sankey vein on the south, the Moody vein in the middle and the Kossuth vein on the north. An excellent surface equipment was purchased and put up and the machinery is capable of sinking the shaft to the depth of 600 feet. Sinking was begun on the Moody vein and this shaft is now 225 feet deep. The ledge varied all the way from 6 to 12 feet of excellent ore. At the depth mentioned, a crosscut was started north to develop the Kossuth vein. This crosscut has now progressed 155 feet and it will be necessary for it to go 200 feet further before striking the vein. This makes a long crosscut, but it is cheaper than to sink on the Kossuth vein. When this development is finished a second crosscut will be run south to catch the Sankey vein. This crosscut will be about 80 feet in length when finished. This development of the Moody & Sankey group of mines has proceeded in a very permanent and conservative manner. The shaft is a two compartment, 4½ by 8 feet in the clear, and the parties have expended \$18,000 on the property since the first of last August.

THE CAMP OF CHAMPION.—Anaconda Review, Feb. 20: Champion is the camp of Oro Fino district, and is assuming proportions that would satisfy any one of its permanency. The buildings planned for the future are to be modern structures of the most substantial and imposing styles. There are hundreds of good prospects, many of which are being vigorously developed. In nearly every case

where any depth is reached, ore in large or small quantities is found. The mines that have a depth of 250 feet are paying, which is evidence sufficient that deep mining is the character of the camp. Eleven steam hoists are in operation near Champion, and the forces at work are being enlarged.

NEW MEXICO.

AZTEC.—Southwest Sentinel, Feb. 25: Recently a big strike was made in the Kleptomani vein on the Aztec property at Pinos Altos. The ore is very rich and will yield between \$13,000 and \$15,000 per ton. About one ton has been taken out and there is considerable more in sight. Yesterday there was a cleanup at the Aztec mill after 41 hours run. Twenty tons of concentrate worth \$63 net per ton, and about two ounces of gold for each ton of ore was saved. Sam Green, a milman of much experience, says it is the best cleanup he ever saw in New Mexico. Another good brick was brought in this week from the Little Fannie mine in the Mogollons and shipped to the San Francisco mint.

GREYBACK GULCH.—Kingston Shaft, Feb. 22: Accompanied by Mr. Wm. Harris and A. W. Farrington, last Monday, a representative of the Shaft visited the Animas Peak mining district, in search of "strikes" and the rumors thereof. After passing through Hillsborough we wended our way across the hill to Greyback gulch, about six miles north-east of our county capital, and up said gulch to the foot of Black Peak, where we were agreeably surprised to find a lively little camp; prospectors and miners all in good spirits. W. H. McDonald is interested with Mr. J. H. Crane and others in several good properties. By invitation of Mr. J. T. Clark we visited the Chance mine, owned by Mr. Clark, J. W. Brooks and others, from which they are taking out and sacking ore assaying from \$250 to \$800 in gold per ton; the lead being exposed in several places for a distance of 1500 feet, and showing pay ore wherever exposed. We were shown some very fine ore by Mr. N. R. Watkins, taken from his Monarch and Blind Tiger claims. These properties lie in the vicinity of the well-known O'Kelly mine. Plenty of water is found in Greyback gulch at a depth of 10 or 15 feet from the surface. Messrs. Woolsey and Farrington own the west extension of the Chance lode, and have done considerable work, which shows up well. They have several tons of ore on the dump, which will give returns of \$20 and upward per ton in gold.

UTAH.

A BOOM.—Salt Lake Tribune, March 1: "Yes, we're going to have a boom in the mining business this spring," said a leading broker yesterday, "and if it wasn't that the snow is fighting for existence so stoutly and so unusually, it would have started before this. For example, I have a number of properties on the market, and although I say it, they are good ones. At the same time I have a number of intending purchasers from the East, and one of them has been patiently waiting here for nearly six weeks to get a chance to see the claims he is willing to buy if they are as good as represented. Once the snow flies—flies away—business will boom." "You might say for one thing," said another gentleman, well versed in the mining industry of Utah, "that in the search for wealth, the hills in the immediate vicinity of this city have never received a fair show. A little prospecting has been done, and a little ore occasionally finds its way to market, but it has been done in a half-hearted sort of way. I have no doubt that a systematic examination would be a paying investment for any one that would go into the business." "The snow blockades we have had tend to keep back ore shipments, and of course trade is a little dull," observed a gentleman connected with one of the assay offices of this city; "but there is one good thing you may report to-day—lead is advancing. It is quoted at \$3.85, as against \$3.75. Heavy shippers can do well at either of those quotations, but the smaller operators have to hustle when it drops below \$4." "Talking about new properties," said another broker, "there are half a dozen going on the market this spring. They will all be worked by stock companies, and include coal, iron, gypsum, lead, lime, the latter to be taken from a marble that will give 95.2 per cent of a pure carbonate of lime. Oh, yes, business will boom, and there are more millions of money in the rocks of Utah than its best friends ever dreamed of, or could even count."

CLOSED DOWN.—Park Record, March 1: Yesterday work was suspended on the Comstock property, situated up Thayne's canyon. However, the suspension of work will be only temporary, or until the winter breaks up and permits the proposed hoisting works to be erected. The character and permanency of the vein have been definitely established, and when the company gets to operating at depth, great results are confidently looked for.

CAMP CROSSCUTS.—Comparatively few mining claim locations have been made since the middle of January. Leaser Thackwell will resume development on the Park City Mining Co's group as soon as the weather permits. White & Thackwell have secured a lease and bond on a desirable piece of ground situated on the course of the Woodside lead. A whim is being put up over the Silver King shaft, up Woodside gulch, and developments will now go ahead with greater vigor. J. H. Steele is working a few men on his property below town and expects to increase the force considerably as soon as the weather moderates. A small force of men is kept at work by the leasers on the Nevada-Northland, and a big lot of high-grade ore is on the dump for shipment. Smith Ehenger is pushing work on the Rosebud property, in the near vicinity of the Anchor. Developments in the face of the tunnel and also in the main crosscut are of a very favorable nature.

ORE AND BULLION SHIPMENTS.—The Ontario made a big shipment of ore this week to the sampler. No bullion or sulphides were shipped from the Marsac mill this week. The Ontario bullion product for the week was 46 bars, containing 30,955.67 fine ounces of silver. Gitsch & Campbell's shipment of ore from the Crescent's upper or leased workings for the month of February amounted to about 150 tons, being lot No. 2.

For the week just ended the Mackintosh sampler received and forwarded 948,430 pounds of Ontario ore; 280,260 of Daly; 144,350 of May Flower, No. 7, leasers, and 80,750 pounds of Woodside ore; total, 1,453,790 pounds.

MECHANICAL PROGRESS.

The Manufacture of Steel Direct from the Ore.

An invention for the production of steel direct from the ore by one continuous heat, for which a number of United States patents have recently been granted, promises to revolutionize the manufacture of iron and steel and attract wide attention; also to prove an important factor in the development of the resources of the South. The claims made for this new process are that by one and the same heat, and by a continuous process, steel for mechanical and structural purposes can be made at a very material reduction from present cost of manufacture, and that by this method phosphorus iron ores can be utilized for the manufacture of every grade of steel as readily as high-grade Bessemer ores. The inventor, Col. William F. Mason McCarty, a well-known engineer chemist, has spent many years in perfecting this process, and it is claimed has, by practical tests, proven and demonstrated its entire success.

The process is one founded on well-known chemical and physical principles for reducing ores to metal at a minimum cost. The special mode of treatment of the ores is such that by it the phosphorus and sulphur, the silica and titanium, are, it is said, entirely eliminated. By the form of furnace used in this process, the metal undergoes not only a reduction but a mechanical puddling and compression equivalent to a hammer and compression of the metal, while the product, it is claimed, will be a superior metal for industrial, mechanical and structural purposes. By this method the reduction of ores to metal requires that the ores first be finely pulverized; they are then placed in the roaster over the top of the furnace proper, through which passes all the wasted heat of the furnace, roasting out all the excess of sulphur contained in the ores, and this before they reach the furnace fire proper. The ores and flux, thus intimately mixed, pass into the body of the furnace; there they are again mixed with the finely pulverized coal or coke, or the carbonaceous matter to be used (when it has been decided to use the solid fuel), and exposed to the destructive action of the ascending flames from below, and from the moment they enter the furnace every particle of the finely divided ores and flux is exposed to the calorific action of the fuel in falling from shelf to shelf of the furnace.

The impurities, such as phosphorus and sulphur, leave the metal at the moment of fusion. The chemical affinity of these impurities having had their molecular balance disturbed by the excessive heat, immediately combine with the basic flux, leaving the metal in a state of purity not heretofore obtained by any other process.

At the moment of fusion, the metal by its gravity falls from shelf to shelf, exposed to the action of the flame, turning each and every time a new surface to the reducing energy of the flame, receiving a mechanical puddling and burning out the excess of the silica or any trace of phosphorus or sulphur yet remaining, after which they are withdrawn into the lower hosh of the furnace.

Here, the air-blowing and burning out of silicates and carbon are completed, when the metal undergoes the carbonizing process and is given the required amount of carbon for the purpose to which it is to be applied. The molten metal is now conveyed into a heated vacuum chamber, where all the occluded gases are withdrawn by the vacuum maintained in a large receiver, connected by hydraulic piping immersed in water for condensation of the heat of the gases, thus rendering the metal a solid, homogeneous mass of the same quality throughout, "a hammered steel in molecular structure." The ingots and castings are one mass alike in structure—solid, free from blow-holes, and of a fine, fibrous structure, particularly fitting it for industrial and mechanical use, for ordnance, armor plates, etc.

The value of gas as a reducing agent is acknowledged by all, but heretofore no one has devised a practical form of furnace to utilize the whole calorific energy of the fuel. By this system all the heat units of the fuel render a *quid pro quo* for cost, and all the heat is utilized in some portion of the process.

The purification of the metal begins with the roasting, and once an atom of sulphur or phosphorus leaves the metal, it is taken up and firmly bound by the basic flux. The simple fact of reducing the ores to a finely divided state allows a more equal distribution of heat, hence an economy of fuel, and while in this state mixed intimately with the flux at the moment of fusion, when the molecular balance of the ore is disturbed and the impurities of phosphorus and sulphur set free, the highly heated flux having a reactive affinity for them, takes up and holds them in a slag.—*Manufacturers' Record*.

THE SUBSTITUTION OF IRON OR STEEL FOR MACHINERY is rapidly gaining ground. It is poor economy to use wood in any piece of machinery—mill machinery especially—when it is possible to substitute metal. The *American Miller*, in speaking of this matter, says: "Suppose you erect a building as nearly fire-proof as your means and experience will permit, and then apply to an insurance company to give you a rate on it. You will not have much to com-

plain of; the insurance folks will charge you a premium that is almost nominal compared with that charged for ordinary manufacturing risks. Then fill the building up with roller-mills, smelters, purifiers, reels and elevator legs, and start them all in motion. Make another application for insurance, and you will be astonished a second time; not, however, at the cheapness of the insurance, but at the steepness of it. There are a good many fire-proof buildings that are not fire-proof after they are occupied, so combustible are the ordinary implements and belongings of life. The risk in the case just cited is twofold—the risk of machinery in motion and the combustible character of the machines used. Against the risk of running machinery there is little to provide, except to cause a dearth of material on which an incipient blaze may feed. But the machines themselves could be greatly improved from a fire-hazard standpoint by the substitution of metal for wood. There are fashions in machinery, and, unfortunately, from time immemorial, wood has been the fashion in flour-mills. But now metal, and especially steel, is becoming so cheap that wood should be supplanted. Let the next man who brings out a milling machine get figures on the relative cost and weight of a steel and hard-wood frame. We doubt if some machinery-builders know how greatly cheapened steel has become in the past two or three years. It is the cheapest thing in the world of manufactured goods to-day, and ought soon to take its rightful place as the common implement of industry. We are living in a veritable age of steel, though but few have realized the full import of the fact."

IRON BUILDINGS MADE EARTHQUAKE PROOF. A cathedral is in process of construction at Manila the materials of which will be almost wholly boiler and cast iron. The design is original, with two tall steeples at the front end and a number of short spires over each apse. When finished, it will be palatial in imitation of stone. Inside, the church is 162 feet long by 70 wide; the height to the tops of the arches is 52 feet. There are two towers, 19 feet square and 170 feet high from the ground to the top of the mid-vane. The walls are of double plate iron, with a space of 30 inches between the plates. The decorative work is of cast iron. The total weight of iron in the building is 1600 tons. The whole is so completely tied and bound together that it is considered absolutely earthquake-proof. It is probable that similar structures will be erected not only in Manila, but in the various cities and towns of the Philippine Archipelago, and there is no apparent reason why the architectural iron manufacturers of the United States should not supply the material for them, or why such buildings might not be put up on this coast. The expense is said to be but little if any more than is involved in stone or brick.

AMERICAN MINING MACHINERY TO BE MADE IN ENGLAND.—Frazer & Chalmers of Chicago, probably the largest manufacturers of mining machinery in the world, are about to erect a large establishment in England for the purpose of manufacturing their machinery in that country. It is said that the business of this firm now reaches about \$3,000,000 a year, making it almost impossible to handle it from one distributing point. They make shipments to Europe, Australia, Asia and Africa, and have heretofore been compelled to ship to London, and from there to the various destinations of the consignments. Hence they have decided to establish a branch in England, near London, where they will manufacture and ship direct, without the additional trouble and expense of reshipment of American machinery, which they are at present compelled to undergo. David S. Frazer will go to England to superintend the erection of the works. This movement has given rise to a report that an English syndicate has bought out their Chicago plant.

STEEL FOR SHIPBUILDING.—Steel may now be considered as the material of which ships are built, and the steady progress made in the adoption of this metal, on the Clyde at least, is shown by the fact that, whereas in 1879 the percentage of steel to the total tonnage was only about 10½, last year it was no less than 97.2 of the whole. In a year witnessing such a rise in price of steel and iron as 1889, this has had a decided effect on the cost of shipbuilding, and compared with 1888, prices of vessels have shown an advance of 45 per cent in some instances, with a smaller but considerable advance in others. Even then the profits of shipbuilders are considered to have ruled comparatively small, the workmen, on the contrary, having by reason of the great demand for their services secured a handsome rise in their rate of wages, and felt the full influence of the improvement in their trade.

TAKES THE BELT.—A mammoth belt, probably the largest in the world, has recently been manufactured by the Munsion Belting Co. of Chicago for the Brush Electric Co. of Minneapolis, Minnesota. The belt is 68 inches wide, 126 feet in length, and weighs 1600 pounds. It is a perfectly rivetless belt, that company holding to the opinion that the material of riveted belts is greatly weakened by the rivets. Their belts are cemented, and in finishing are made to pass between rollers having 250 tons' pressure.

KID GLOVES just being shown as the newest are said to be made of colt-skin.

SCIENTIFIC PROGRESS.

The Eye.

The eye, whether of man, animal or insect, is one of the most wonderful things in nature. Between man and the insect its forms and modifications are great and varied. Of course in man this member is the most perfectly developed; yet there is good reason to believe that its present degree of perfection has been reached only by successive developments or evolutions. There is a good degree of evidence for the belief that the eye of man, even at a comparatively recent period,

Could Distinguish Only Two Colors—Black and Red.

Science gives us interesting details about what the human eye has been and what it may become. The Vedas of India, which are the most ancient written documents, says a late writer, attest that at times most remote, but still recorded in history, only two colors were known—black and red. A very long time elapsed before the eye could perceive the color yellow, and a still longer time before green could be distinguished; and it is remarkable that in the most ancient language the term designated yellow was sensibly passed to the signification of green. The Greeks had, according to the generally received opinion, the perception of colors very highly developed, and yet authors of a more recent date assure us that as late as the time of Alexander the Great the Greek painters knew but four colors, viz., white, black, red and yellow.

The very words to designate blue and violet were wanting to the Greeks in the most ancient times of their history, they calling these colors gray and black. It is thus that the colors in the rainbow were only distinguished gradually and the great Aristotle only knew four of them. It is a well-known fact that when the colors of the prism are photographed there remains outside the limit of the blue and violet in the spectrum a distinct impression which our eyes do not recognize as a color. Physiologists tell us that it is reasonable to suppose that as the color organ becomes more highly developed, and even before the human eye becomes perfect, this outside band will evolve into a color perfectly discernible.

A late writer in *Popular Science News* says: "It is a generally accepted theory that what are called the 'rods and cones' in the human eye are the true organs with which we distinguish colors. These organs are wanting in many animals, as, for instance, they are wanting in the eyes of sharks and roachas among the fishes, and in hedgehogs, moles and bats among mammals, so that if the analogy holds good, these animals can have no sense of color. Among birds, the owl is but scantily supplied with rods and cones, while birds of prey which fly by daylight, as gulls do, are more plentifully endowed with them. Through examination of the human eye and the way in which it perceives color, it has been concluded that to frogs the whole world they see is yellow, while to certain birds the entire visible creation must seem red—the sky, the sun, the flowers, all, in short, that comes within the range of their vision is red, because the construction of their eyes permits of the perception of no other color. To them the world must appear as it does to us when we look through a piece of red glass. This train of thought could be carried much further."

Electro-Magnetic Disturbances.

It is well known that electro-magnetic disturbances on the Pacific Coast have occurred simultaneously with certain sun disturbances observed through the telescope. Evidently the electro-magnetic force must have traveled from the sun to the earth with the velocity of light. Twenty years ago Clerk Maxwell asserted that light was an electro-magnetic wave movement. Following out his suggestion, an interesting series of experiments has recently been made by Prof. Hertz of Brown University at Providence, Rhode Island, which show that electro-dynamic force is, like light, a wave motion, propagated through ether, and like light subject to reflection, refraction, and concentration by means of lenses. Prof. Hertz's experiments were based on the variations of an induction current at various distances from a metal wall, reflecting the primary current; based, in fact, on the well-known phenomena of wave interference, and they show the length of an electro-dynamic ether wave to be 1.72 m., its velocity through space to be 300,000 m. per second, or identical with that of light. By means of a metal reflector, electro-dynamic waves were focused, some substances, such as wood, being transparent; others, such as metal, being opaque, and casting electro-dynamic shadows. A huge prism of tar, weighing 1200 pounds, showed that the laws of refraction are analogous to those of light. Almost infinitesimally short vibrations of ether manifest themselves to us as chemical action, longer ones as light, still longer waves as heat, and these very long waves as electro-dynamic force. Electro-dynamic force is the low and foundational base of which light and heat and chemical action are the high tresses.

A NEW COMPOSITE METAL.—Schmiedharen-gass is the inconveniently long name given to a new composite metal for which almost marvelous properties are claimed. It is composed of

pig iron, wrought iron, copper, an aluminum bronze alloy and a flux. It is produced direct from the ore without annealing, yet it can be welded and hammered like iron or steel, and can be manufactured, it is claimed, at a less cost than malleable iron or steel castings. At a test made Jan. 20th in Louisville, Kentucky, it is said to have endured a tensile strain of 168,000 pounds per square inch, that being the limit of that machine. The new composition is the discovery of Mr. Hatzfeldt of Newport, Ky., who has made many experiments in producing aluminum.

MAGNETISM OR ADHESION.—At frequently recurring intervals the daily press make announcements of the alleged wonderful "magnetic" qualities exhibited by certain individuals, who are able to make various substances adhere to their hands without exerting any muscular pressure upon them. The miscellaneous nature of the bodies which are embraced in the list of such adherents, embracing wood, glass, etc., would at once dispel the theory that magnetism, either "personal" or otherwise, had anything to do with the phenomena, but they are so rarely investigated with the object of reaching their true cause that an instance of the latter deserves attention. Such investigation, says the *German Telegraph*, has been recently made by Dr. W. Simon of Baltimore, which proves pretty conclusively that causes other than magnetism must be assigned to the observed facts. The subject examined was able to maintain, by mere contact with the fingers, a weight of 2500 grammes; but it was shown that this power was exercised only to very smooth or highly-polished substances, glass being the most favorable in this respect. The cause assigned by Dr. Simon to account for the observed facts, and which is probably the correct one, is the well-known adhesion between two bodies brought into such close contact as to exclude the air between them, the pressure of the atmosphere acting to maintain the bodies in contact. It is, therefore, only a question of the smoothness of the skin which would appear to be the qualification necessary to enable any one to manifest "magnetic" properties.

WAR IN A DROP OF BLOOD.—Observations recently made in Italy in regard to the microbe of malaria show that at a certain period of its development this microscopic creature has enemies to fight in a globe of blood, and that in order to escape from them, it makes use of its flagella or whips with which it tries to beat off the inimical microbe that is bent on absorbing it, and generally ends by doing so. Here certainly is intelligent adaptation of means to ends; yet how different from ours must be the world that the malaria microbe finds within a drop of blood that runs within us. The universe appears to be as vast downward as it is upward.

RENDERING WOOD FIRE PROOF.—If we can depend upon the claims of a New England chemist, he has made a most wonderful and valuable discovery. This discovery consists of a cheap method of dissolving zinc by combining it with hydrogen, forming a solution called zinc water, which has the property of rendering wood, to which it has been applied, absolutely fire-proof. The cost of the material and the application is said to be very light, and the discovery will be of the greatest value to hotel and theater proprietors and the owners of all large buildings.

A CURIOUS CIRCUMSTANCE.—A curious circumstance is noted by the *Tampa (Fla.) News*: An orange grove near that place was abandoned a long time ago. The cars pass the grove, and it is said that the row of trees next the car track has a healthy, vigorous appearance, while all the trees beyond, with one exception, have a deathly pallor, which betokens early demise. Whether the thriftiness of the trees next the track is due to the trembling of the ground, caused by passing trains, or to the smoke from the engines, both or either, is a question.

RAPID FLYING OF DUCKS.—A canvas-back duck flies at an habitual rate of 80 miles per hour, which is increased in emergency to 120. The mallard has a flight of 48 miles an hour; the black duck, pin tail, widgeon and wood duck cannot do much better. The blue-wing and green-wing teal can do 100 miles an hour and take it easy. The red-head can fly all day at 90 miles per hour. The gadwall can do 90 miles. The flight of the wild goose is 100 miles per hour.

PRIZES FOR BIOLOGICAL STUDENTS.—Prof. C. A. Stephens of Norway Lake, Me., having come to the conclusion that the time has come to concentrate upon the one proper subject of biology, namely, the renovation and prolongation of human life, has offered three prizes, one of \$175, another of \$125, and a third of \$100 for the best three comparative demonstrations, by means of microscopical slides, of the blood capillaries in young and aged tissues, canine or human.

ADVERTISING ON THE CLOUDS.—According to the *Electric World*, a Western inventor is endeavoring to interest capital in his electrical magio lantern for casting or reflecting advertisements on the dark clouds that often hang low over a city. He claims to have secured contracts from several well-known firms for displaying their notices in this manner.

GOOD HEALTH.

The Germ Theory of Disease.

(By AMOS ADAMS.)

The wonderful and important revelations that have been made and are constantly being made with the microscope transcend, in their importance to the well-being of man, the discoveries of all the telescopes in Christendom, the monster Lick included.

Scientists and microscopists tell us the atmosphere we breathe is filled with

Living Organisms.

And that there are spores of them that are very dangerous to persons who inhale them, more especially if affected with catarrh, throat or lung difficulties.

We desire at this time to call your attention to the case of so many cases of sickness among those who attended the last meeting of the State Grange. For two weeks we have been a victim of the poisonous inhalations while there, and propose in this paper to have something to say about these unseen (to the naked eye) denizens of the air, that are so detrimental to the health of mankind.

Atmospheric Micrography

Is one of the latest sciences whose small beginnings do not date back more than three decades; but at present many scientists scattered over the civilized world are giving the best years of their lives in studying the character and habits of the bacilli in their manifold forms.

It is well known to all readers of the literature of the day that Dr. Pasteur, one of the greatest savants in all Europe, has spent many years in searching for the cause that produces hydrophobia. Dr. Gamellia of Odessa, with several confreres, is endeavoring to discover the germs that produce cholera. There are also a great number of physicians in nearly all parts of the world who are endeavoring to find the cause of consumption and other forms of tuberculosis, and with wonderful accord they have directed their investigations to the

Unseen Living Organisms of the Air.

And to these they ascribe the cause of most of the diseases that flesh is heir to.

At a meeting of the Academy of Sciences held in Paris in 1860, Dr. Pasteur read a paper explaining the comprehensive and intelligent system he had adopted in investigating, analyzing and classifying atmospheric germs. His investigation revealed many curious objects among the minute articles held in suspension in the air, among which are found grains of dust raised from the soil, carbonate and sulphates of lime, little globules of magnetic iron that have come into our atmosphere perhaps from infinite space, with other forms of inorganic matter. With these are found hutterflies' scales, the debris of dried insects, vegetable pollen, filaments of seaweed and other lifeless organic substances. Associated with this infinite variety of small particles are

Microbes of Different Species

Which have the ability to live by means of organic matter suspended in the air. The statement would be incredible, without the aid of a microscope, that living organisms, 1500 of which if collected would not be as large as the head of a pin, are living, thriving and fattening on other organisms, animate and inanimate, defying, or rather rising superior to, the laws of gravitation, and remaining at will suspended in the atmosphere we breathe.

Farmers living comparatively isolated from each other are bleasted with an atmosphere coming direct from Nature's great laboratory, purer and healthier than is found in cities; yet microbes, bacteria and other dangerous living organisms exist only in lesser quantities. Put vegetable mold under a powerful magnifying glass, and you will find it

A Mass of Living Organisms.

This mold or apparent dust is frequently found in furniture, also in wall-paper in rooms that have been closed up for some time. When the doors and windows to each room are first thrown open, permitting the vitiated air of the room to mingle with the pure atmosphere from without, an atmospheric condition is formed for microbes to propagate, at which times they are more dangerous to man. Therefore rooms should be well aired and kept clean by frequent dusting before being used. These remarks will apply with equal force to churches, to assembly-rooms, to Grange halls, or to rooms in dwelling-houses.

We remember, during our attendance at Grange meetings in this hall, that we were the first one to enter it after the door was unlocked, and we found the atmosphere in it dense and heavy—exactly the place for myriads of microbes to congregate, and it only required the vitalizing atmosphere that soon came in at the door to arouse them from their dormant conditions and send them out on their deadly errands. These conditions are often brought about at our State Grange meetings, where three or four hundred human beings are densely packed. With the animal heat and the natural emanations thrown off from the human body, with doors, windows and window blinds tightly closed by some timid member who is in constant terror lest some person on the balcony on the opposite side of the street should look in and find that at some stage of our work the candidates were or were not blindfolded—with

these conditions the atmosphere in the hall soon becomes

Ton Ville for Description.

And of course dangerous to health. It is at such times, with the little pure air working its way through the door that is occasionally opened, that the deadly microbes begin their work. This they do by attaching themselves to the weaker parts of the human body; for instance, if one is troubled with nasal catarrh, they will gather in large numbers in the nose and head. If the throat, bronchial tubes or lungs are sore or weak, they will soon settle themselves to those parts, and persons thus afflicted will find themselves trying to expel these uncanny tenants by clearing the nose, by coughing or by expectoration, wondering at the same time how in the world they caught such a cold, when in fact

It is no Cold at All.

But the presence of the bacteria in some of its manifold forms. It is said that microbes differ from most expressions of life in this, that in the process of propagation they do not have to come in contact with the opposite sex; some varieties seem to crumble to pieces at will; each piece or fragment is endowed with life. Other varieties seem to be joined or more like buttons placed on a string, and when desirable the string is broken and each section goes immediately to work forming other sections or joints, and thus the process goes on. At every inspiration of breath we take in more or less of these enemies of man, but constitutions not weakened by worryment, mental or physical exhaustion, as a rule repel their assaults as readily as a well-fortified fortress would the attack of an enemy. Yes, we drink in unseen living organisms in the water we use, and

Eat Them From Our Tables.

Only a few weeks ago we were amusing ourselves with our microscope, when we placed a drop of water on the glass plate, and to our astonishment on applying our eye to the microscope we saw the most vicious and repulsive forms of life imaginable disporting themselves as though they were attending a high jinks party. The very idea of taking these lizards, reptiles and sea-serpents wiggling and wriggling into our stomach was most repulsive, and we almost wished ourselves an angel to avoid such a catastrophe. But as we reflected that we could cook their goons by boiling the water, we concluded we had better remain on this mundane sphere awhile longer.

Our next experiment was to place under the microscope some of the mealy substance that accumulates around the stems of figs that have been packed two or three years. In this we discovered a large number of

Big Bugs and Little Bugs.

Resembling in form and appearance the tumblebug we sometimes see in the road on a summer day. At first they seemed a little confused at the new condition of things, but soon became reconciled to their new lot and meandered around as lordly as heirs to some throne, little thinking had we left them on the figs some hungry person (not ourselves) would have made a meal of them. Thus we see life is a constant warfare with the seen and unseen forces of Nature.

USEFUL INFORMATION.

A PNEUMATIC TIRE FOR BICYCLES.—A pneumatic tire for bicycles has been invented in Belfast, Ireland, which, if all that is claimed for it be true, must make a new era in this method of recreation. The tire is about 2½ inches in diameter, and is composed of an outer covering of rubber, graduated in thickness from about one-quarter of an inch, where it touches the ground, and is protected by canvas, where it is attached to the rim, which is very broad and nearly flat. Inside this outer covering is an inner tube which contains the air. The air is pumped in with a foot-ball blower, and a patent air valve prevents its return. Vibration is practically annihilated. A frame so protected should wear out two frames with solid tired wheels; and not only so, but riders will be able to use very much lighter frames without any danger of their collapsing. In a recent 50-mile road championship in Phoenix Park, Dublin, one of the competitors rode a racing safety, fitted with "pneumatic" tires, and scaling only 23 pounds, and yet it passed through the ordeal—an ordeal trying to even the heaviest makes—without the slightest damage.

OIL FROM CORN is one of the latest products which modern science every now and then throws upon the world. The maize, which is now grown in the United States at the rate of some 2,000,000,000 bushels per year, has been experimented with and found capable of yielding 3½ per cent of its weight in oil, the germ of the kernel being the part from which the oil is extracted. The new material is of a pale yellow color, somewhat thicker than either the olive or cotton-seed oil, and does not seem to be readily available as a substitute for them, but it is well adapted for lubricating purposes, and may be used as a salad dressing, while it seems to be desirable for liniments.

PULP TO BE MADE BY ELECTRICITY.—The Portland (Me.) Express says: Some of our Kennebec pulp-men are becoming so deeply interested in a new departure in the manufacture of fiber from wood that they are willing to in-

vest their money. The agent employed in reducing the wood is electricity, and it is claimed that the fiber is manufactured so cheaply that the entire pulp business will be revolutionized, and the digesters now in use be driven out. Kellner of Germany has been experimenting for several years with electricity in this direction, and has now succeeded in perfecting the process. A patent on the process has been applied for in the United States, and our Kennebec men have an interest in it, and are making plans to erect a plant for the manufacture of fiber by electricity.

SHOP NOTES.

Suggestions for the Shop.

We clip the following shop suggestions from the Boston Journal of Commerce:

As long as there are two sides to everything we must expect to find everything with two ways to work with. A bolt nut can be screwed on with the corners up or left with the corners down, and still be in accordance with some of the heat engineers and draughtsmen. Both ways have their advocates, though it is the simplest thing in the world to see that they should be left down where they belong.

Beils, too, have two ideas to look out for, unless they are made double with the grain side out on both of them; but where they are not they can be put on either side out first and the reason studied up afterward.

The strength of iron can be increased by heating and cooling suddenly in water, but it is more likely to snap off suddenly by the operation, so forgemen allow time for it to cool gradually, as it is the strain that it will hold on the snap that they are looking out for.

Steel has been found to stand a greater strain by being hardened in oil than in water.

How much stronger will it make a pulley if you have the rim increased to twice its thickness? Not any that we know of, as the centrifugal force increases directly with the weight.

How is it figured out that a wheel built of soft pine will stand twice the number of revolutions per minute that cast iron will? It is done in this way: Cast iron is 12 times as heavy as soft pine when compared in regard to their volume, and only twice as strong when taken on a direct pull. In this way soft pine has six to one in its favor when working under the same conditions as that of cast iron, but as the centrifugal force increases as the square of the speed, it can only be made to run twice as fast as an iron pulley and have enough left to make up for the loss in strength where the fellows overlap each other in their make-up.

It is a good trait in a lathe man to think over everything carefully, and be careful of what is required, long before attempting a difficult undertaking, but it is thought better in these times to grasp the idea at once and start in on a job immediately, trusting that the thoughts may flow freely enough to keep ahead of anything that may turn up to interfere with the work till it is finished.

It would be well for some of the machine-builders nowadays if they could be made to work awhile with their own machinery, and let them see how they would like to operate a lever that shuts by where there is not room for the fingers, or a hand-wheel that gives the knuckles a chance to get knocked off at every turn.

A new way to get a leather covering for a pulley on tight is to make it wide enough to stand off on the edge a little, then round it over on to the inside and draw the edges together after the fashion of lacing up a drumhead. It must make a hard-looking sight, yet it is recommended, even though we must use iron tie rods instead of drum strings. A belt that is loaded too heavily for a good, smooth iron pulley is loaded too heavy for a covered wheel, and will show signs of its being overloaded whenever a paper covering is used by throwing the obstructions on the floor.

To keep a lot of thin hack boards from splitting, which have to be made new every day, just run some wire rods through them crossways and rivet a washer on each side. The rods, one at each end, will do the business, and if the boards split they are still as good as ever. But how about boring for a rod that is nearly as large as the stock is thick? Cut the wires and point them flat drill fashion, and bore these through themselves and leave them in their places. You can tell from the heat which side the board the stock is growing the thinnest, and by bending the board as if it were warped a trifle, the rods can be made to keep in the center until they reach the opposite side.

We still find about as many as ever fussing over a belt hook. When a belt gives out, it generally breaks across where the ends of the hooks come, and if there were enough belting to spare it would be a good idea to take a knife and clip the piece off close to the other end of the belt hook and throw the piece away. But not the screwdriver man he brought into use, and the end of the hooks lifted to an angle, by means of which no one has been able to tell, and knocked with a tack hammer. Better turn the splice backward till one or both apices are brought into the center of the hooks; then open out the ends on one side and slip both pieces off over them.

ELECTRICITY.

A New Electric Block System.

Both history and experience teach us that whatever may be the demands of advancing civilization for the protection of the people—their property or their lives—the thinking brains, the cunning hands, and the right men always present themselves to meet the requirements of progress. With this fact in view, we need have no fear that so great a boon as the use of electricity in furnishing a perfect illuminating medium, or in conveying our commands through the avenues of our great cities, or in regulating the movement of railroad trains safely along the iron track, will be made not only eminently practicable, but practically safe from danger to life and limb. We have already made allusion to a safety appliance for removing danger from electric-light wires, by the use of which a powerful electric current may be instantly rendered free from danger the instant a dangerous break occurs. We have now before us the details of a new and automatic electric block signal system by which the danger of collision is rendered almost if not quite an impossibility. The system may be extended along the whole line of road and is as equally applicable to a single as to a double track. It is automatic in action and thus much cheaper than the system at present in use. The indications are that a most important advance has been made in securing safety from railroad collisions. So important is the invention considered at the Patent office that a special hearing was granted to speed the same through the office. The papers are said to cover everything that could possibly apply to the invention. When engines run backward, the batteries are reversed accordingly. Switches are protected at each end, and automatic signals can be put up at country roadways or dangerous crossings showing that a train is approaching from a mile or one-half mile, or any distance away desired. Foreign patents have also been applied for.

The inventor is a Pittsburg man, who claims that it will do away with the present block system, and render useless the large army of telegraph and block signal operators that are now employed. A model has been shown, says the Pittsburg Dispatch, operating on a double track 40 feet long, with sections or blocks every four feet. At each block two little signals of red and white, to show either danger or safety, were placed on either side of the track, with the safety signals all up. A tiny engine then started down one of the tracks, and as the first block was passed the safety signal dropped and "danger" was displayed, showing to any train coming behind that the block was occupied. At the next block the second danger signal was displayed, showing that the second block was occupied, while simultaneously the first block displayed a white signal, indicating that it was clear, and so on down the line until the end, showing that every block could hold a train in safety and not allow it to pass on until the block ahead was clear.

This exhibition is said to have been perfectly convincing to the railroad men present, as was also a demonstration on a single track, where danger lies not only behind but from ahead, showing beyond doubt its practicability and its assured success.

This last proof of its perfection called hearty congratulations and assurances of success from the practical men present, while all admired the simplicity of the affair.

THE ADAPTABILITY OF THE ELECTRIC MOTOR.—Perhaps there is nothing that has occurred recently that better illustrates the quick and ready adaptability of the electric motor for all kinds of service where power is required than the misfortune which befell the large printing and publishing establishment of the John Morris Co. at Chicago, which completely deprived the company of any power to run its numerous presses, paper-cutters, rollers and other forms of machinery used in connection with its business. As is known, one of the rollers exploded, ruining the steam plant, the repairs to which cannot be made short of a month or six weeks. The power required for running the presses is about 40 horse-power, and notwithstanding that this accident happened late Friday afternoon, by Saturday night a 40 horse-power Thomson-Houston motor was in position and everything in readiness to start up the great presses and the work of the establishment upon the arrival of the help early Monday morning.

AN ELECTRICAL RAILROAD BRAKE.—Prof. Forbes and I. A. Timmer of London have invented an electric railroad brake which appears to possess a wonderful efficiency. A car fitted with this brake was suddenly slipped while moving at the rate of 42 miles an hour, and was brought to a standstill in 450 feet. Another car was brought to a stop in 180 feet from a speed of 30 miles an hour. Of course by this device the adhesion due to friction is added to the resistance due to electrical attraction, the latter being nearly or quite equal to the former. To all appearances, Mr. Westinghouse may soon have to look out for his laurels.

CUTTING DOWN WIRES.—It is said that 338 poles have been cut down, and 472,692 feet of wire have been removed from the streets of New York during the recent raid upon the electric wires of that city.

Passing Events.

The strike of the molders, coremakers and apprentices in the local foundries is very greatly to be deplored, in view of the general depression in the iron industry. The foundry companies, however, protest that it is impossible for them to compete with Eastern manufacturers under the present condition of affairs. This struggle has been anticipated for a long time.

The large smelting organizations of the United States have combined against the Lead Trust, with a view, as they say, of "placing their interests beyond the control of the Lead Trust."

The project of extending the Sastro tunnel westward for a mile is again being discussed. Many believe that there is rich ground in that direction that the tunnel will open.

The warm rains of this week have had the effect of melting off much snow and raising the rivers somewhat, but no harm has been done from overflows.

A very considerable falling off of hullion production is shown in last month's work in the mines of this State and Nevada, owing to the unprecedented storms which have prevailed.

ANOTHER "old Californian miner" reports favorably on the gold region in Maine, extending from Sandy river to Androsoggin.

An Inventor Rewarded.

We were reading the other day in a Philadelphia paper the account of how an inventor, C. H. Van Hagen, was rewarded by the Chester Twist Drill Co. for devising a machine to forge twist drill. He was paid \$25,000 in cash, \$65,000 in stock and given the position of superintendent at \$50 per week. This simply shows that there are prizes as well as blanks for inventors. An instance of a quick reward for invention occurred in this city within a few weeks and with larger figures than those cited above.

Dr. Benjamin Marshall of San Francisco obtained through the MINING AND SCIENTIFIC PRESS Patent Agency on Jan. 28th, a patent for a sash balance and lock, and a company has been organized to make and introduce the device. Dr. Marshall receives \$200,000 in cash and stock valued at \$50,000 in the company. This gentleman has invented several other devices of importance, among them a nut lock which is in use on the Southern Pacific Railroad and has just been applied on the Pennsylvania Central.

His invention is one of that class of devices for raising window-sashes in which a spring is employed, and the invention consists in the novel arrangement and combination of the spring, the pinion which it actuates and the rack-wheels the pinion engages. It further consists in combination with these parts of a suitable catch for engaging the pinion or the rack and locking the sash in any desired position. The object is to dispense with the weights by the substitution therefor of a simply arranged spring-actuated device which can be readily applied to any sash, and the use of which will simplify the construction of window-frames or casings.

In the bottom rail of the sash and from one end thereof is made a deep hole in which is seated the spiral spring, and mounted on the stile of the sash is a pinion which is so connected with the spring that as it rotates in one direction, it winds up the spring and is itself rotated in the other direction by the unwinding of the spring. This connection is preferably effected through the turn-rod which carries the pinion on its outer end, said rod being let into the hole of the sash-stile, the spring encircling it. The outer end of the spring is attached to the rod, and its inner end fastened in the base of the hole. Secured properly to the inner surface of the head of the window-casing is a rack with which the pinion engages.

A spring-controlled bolt is seated in the window-stile and adapted to project its end between the pinion-teeth whereby the parts are locked and the sash held in any desired position.

The operation is as follows: Suppose the sash to be in a raised position. Now, upon pulling it down, the pinion, traveling in the rack, turns the rod whereby the spring is wound up. Then when the sash is down and is released, the spring in unwinding returns the rod and rotates the pinion, which, traveling in the rack, raises the sash. The bolt when operated engages the pinion-teeth and thereby prevents it from turning, or it engages the rack-teeth, as may be desired, and in this manner the sash may be locked in any position desired.

Thus no weights are needed and the present complex construction of the window-casing is avoided. The catch may be a spring catch or other form, if desired, its function being to lock the sash by preventing the movement of the pinion in the rack.

SUTRO TUNNEL.—It is stated by well-informed persons that work on the long-proposed project of extending the Sutro tunnel, Virginia City, Nevada, farther west will be commenced within the next 60 days. It is the intention to drive the tunnel ahead through the Savage Mining Company's ground on west fully 1000 feet before stopping for ventilation or for other purposes. As the work progresses it will be watched with unusual interest by practical mining men, who assert, without qualification, that there are at least two, and perhaps more, well-defined lodes on the Comstock, one of which is nearly all silver-bearing and the other nearly all gold-bearing quartz. The first has been worked for years, but work to develop the latter has only recently been thoroughly commenced.

The Molders' Strike.

On Monday morning last a strike was inaugurated in this city by the Iron-Molders' Union against the local foundries, and 200 of the molders quit work. Since then the core-makers and some apprentices have also left their work. The Molders' Union gives the following as the number in the shops affected: Vulcan Iron Works, 17 men, 2 apprentices; Union Iron Works, 40 men, 7 apprentices; Rio-don Iron Works, 14 men, 5 apprentices; Pacific Iron Works, 16 men, 2 apprentices; Steel Works, 15 men, 2 apprentices; Occidental Foundry, 14 men, 3 apprentices; Fulton Iron Works, 20 men, 5 apprentices; National Iron Works, 11 men, 3 apprentices; Vulcan Iron Works, 2, 9 men, 2 apprentices; City Iron Works, 10 men, 3 apprentices; Lewis & O'Connell's, 12 men, 2 apprentices.

There are only 275 molders involved in the strike, but the laborers, core-makers, pattern-makers and assistants have nothing to do when the molders quit, so they, too, will be compelled to quit work.

The discharge of Joseph F. Valentine and two other Union men by Steiger & Kerr was the cause of the strike in the Occidental Foundry, while the cause of the strike in the other 13 establishments was the action of the Engineers and Foundrymen's Association in giving notice that on and after March 10th the Union's regulations regarding time of work and pay would be ignored, and the agreement between employers and employees declared void.

The members of the Engineers and Foundrymen's Association complain that while they are paying the men higher wages than are paid in the East, they do not get a full day's work for the wages paid, the men doing only a specified amount by agreement among themselves. It is not desired to cut down wages, but matters have come to such a pass that the men must work on such terms as will allow the foundries to compete with the East. As it is, even such common castings as house-fronts are shipped here from Chicago, and large contracts which should be carried out here are finished elsewhere.

Trouble with the molders has been anticipated for the last year or two, for the foundrymen have been restive under their actions. Some of the men are not worth half what others are, but all must receive the same. The apprentice system, too, is bad, there being little chance under existing circumstances for the rising generation to learn a trade.

Eastern manufacturers pay \$2.50 per day for molders, while here they are paid \$3.50, and the local foundrymen must compete with those who pay the former rate. The foundrymen claim that they cannot pay higher wages and have a day's work limited to suit the ideas of the members of Molders' Union, and then compete with Eastern manufacturers.

The proprietors of the foundries say no better time for the strike could have been chosen, since business in the shops is very dull. Several of them aver that they will send patterns East and have the castings made there and shipped here, and can do this as cheaply as it could be done in San Francisco under present circumstances. Both sides in the contest seem confident of success. The Foundrymen's Association assert that it is impossible to continue as they have been doing. The strike involves our most important manufacturing industry, and if continued will cause great loss to the State.

The Union declares that it will make no settlement with the manufacturers unless they agree to pay the minimum rate of wages and employ but one apprentice for every eight journeymen. The Union further declares that it has never restricted and never will restrict the amount of work to be done by any member. This latter statement the foundrymen deny. It is certain that the foundry business has not been profitable of late in San Francisco, and that less work is being done than should be the case.

A NUMBER of merchants and manufacturers of this city have petitioned the Pacific Coast delegation in Congress to lend their aid in repealing the section of the Interstate Commerce law known as "the long-and-short-haul section."

On the Comstock they crushed 4840 tons of ore last week, the yield being \$109,073.

Pohle's Air-Lift Pump.

(Continued from page 161.)

was started. Beginning with atmospheric pressure, the increase of pressure was noted for each 30 strokes of the compressor piston, until a pressure was reached beyond that required in the pump tests. The contents of the receiver was 117 cubic feet. The compressor made uniformly one stroke per second. The atmospheric pressure was 2.51 feet of mercury. The air was unusually dry.

The data obtained formed the basis for calculating the number of pounds of air delivered, per piston-stroke of the compressor, to the receiver at any required pressure. An average of the results of the two tests was adopted. The following table gives the values obtained:

Pressure receiver, lbs. per sq. in.	0	5	15	25	30	35	40
Lbs. of air per stroke	.104	.098	.088	.081	.079	.077	.076

The second method adopted was as follows: A small auxiliary chamber B was attached to the receiver. (See Fig. 3.) Compressed air entering this chamber escaped into the atmosphere through a carefully-measured circular orifice in thin plate. After a pump test had been completed, the compressor was kept running, cock C was closed, and cock A opened and adjusted until the conditions in the pump test, regarding number of strokes of compressor per minute and the pressure in the receiver, were repeated and maintained.

The pressures and temperatures of the compressed air in chamber B and of the atmosphere furnished the data upon which to make a calculation of the quantity of air escaping through the circular orifice. This quantity was evidently the same as that supplied in the pump test. Such tests were made from time to time, and served to check the values taken from the table given above.

The engine used to drive the compressor was built for ten times the power actually applied to the compressor; hence a test of the efficiency of the entire plant was not made.

In the paper referred an extended table is given of the pump tests, for which we have not space. The writers say: The "efficiency of the pump" is based upon the least work (L) theoretically required to compress the air and deliver it to the receiver. See Fig. 4.

Atmospheric conditions..... P_a T_a
Receiver..... P_r T_r

The values given in the table take no cognizance of the losses of power in the engine and compressor.

If we assume the efficiency of a suitable compressor to be 70 per cent, the efficiency of the pump and compressor together would be 70 per cent of that given in the table for the pump alone.

An inspection of the above table shows:
1st.—That, for a given submerison " h " and lift " H ," the best efficiency was obtained when the pressure in the receiver did not greatly exceed the pressure due to the submerison. [This was only true when the ratio $\frac{H}{h}$ was kept within reasonable limits—i. e., where H was not much greater than h .]

2d.—That the smaller the ratio $\frac{H}{h}$ the better was the efficiency.

We may say in a general way that under the better adapted pressures in the receiver, the pump, as erected, showed the following efficiencies:

For $\frac{H}{h}$	0.5	1.0	1.5	2.0
Efficiency	50%	40	30	25

It is apparent that the air pipe should not have been reduced at the discharge end, as such reduction necessitated a greater pressure in the receiver for the delivery of the air to the pump.

Unfortunately, the data is wanting for a reliable estimate of the loss due to the frictional resistance in the small air-pipe. A rough estimate shows that such loss must have been large. The substitution of a 1½-inch air-pipe in place of the 1-inch would have appreciably augmented the efficiencies given in the table. In justice to the pump, a considerable allowance should be made for this easily avoidable loss.

The last test shows a limit of lift for a given submerison, beyond which a large excess of pressure is required to pump even an insignificant quantity of water. For good efficiency, it becomes necessary that the lift should not be very great as compared with the submerison.

Where a shallow sump only is available to pump from, and a considerable lift is to be made, Dr. Pohle introduces an auxiliary pipe to receive the water, after being pumped to a small height, and act as pump-well for a higher lift. See Fig. 5.

No attempt has been made toward an analytic treatment of the action of this pump, but its simplicity commends it for many purposes.

Among the numerous applications which Dr. Pohle proposes for this air-lift may be mentioned: The drainage of mines, the supply of water from deep wells, the lifting of liquids which damage the working parts of pumps ordinarily used, the increase of lift and capacity of other pumps by introducing an air-lift into the pump column.

Gold-Milling Mortars.

In gold-milling in the Black Hills two types of mortars are used. The points of difference lie in the inside dimensions of the lower part of the mortar, and in the arrangement and number of inside amalgamated plates. These differences are described in a paper by H. O. Hoffman of Rapid City, Dakota, read before the American Institute of Mining Engineers.

The Homestake mill mortar (Figs. 1, 2 and 3), weighing 5400 pounds, is $54\frac{1}{2}$ inches high and $54\frac{1}{2}$ inches long. The feed opening, beginning $6\frac{1}{2}$ inches below the top, is 24 inches long, $4\frac{1}{2}$ inches wide and 7 inches deep. On entering the mortar it remains 24 inches long and 7 inches deep. At the bottom of the feed, forming the continuation of the incline over which the ore passes into the mortar, is a lip $4\frac{1}{2}$ inches above the inside bottom of the mortar. As the lip wears out fast, it might be well to cast it thicker, as has been done on the Caledonia mortar. Taking the front view of the mortar, we find $15\frac{1}{2}$ inches from the bottom the discharge opening $48\frac{1}{2}$ inches long and $2\frac{1}{2}$ inches high. The frame is inclined outward about 10 degrees from the vertical.

On the short sides of the discharge opening are grooves to receive the chuck-block, screen-frame and curtain, which are held in place by keys and sockets. The chuck-block is also fastened at the bottom by two horizontal keys, supported by lugs on the outside lip of the mortar below the discharge. Viewing the mortar in cross section, we first have the two bottom flanges, 3 inches high and 5 inches broad. The bottom of the mortar (the mortar-bed) is $7\frac{1}{2}$ inches thick, the sides, at the foot of the dies, $3\frac{1}{2}$ inches. The inside dimensions are: Width at the bottom, $10\frac{1}{2}$ inches; length, 50 inches; height to issue of mortar (not of pulp), $8\frac{1}{2}$ inches; width at this point, $13\frac{1}{2}$ inches; at the top of discharge-opening, 20 inches; at the top of mortar, 16 inches; total inside height, 47 inches. The casting is three-fourths inches thick from the top down to the feed-opening, on three sides, the back being a little thicker.

A mortar lasts four years, wearing pretty uniformly at the sides and back.

The Caledonia mortar weighs 5700 pounds, is $57\frac{1}{2}$ inches high and 54 inches long. The feed-opening, beginning $15\frac{1}{2}$ inches from the top, is 3 inches wide, 11 inches deep, and extends the entire length of the mortar, having a strengthening rib in the center. At entering the mortar it is $50\frac{1}{2}$ inches long and $7\frac{1}{2}$ inches deep. Here the top, $2\frac{1}{2}$ inches thick and 8 inches wide, measured on the incline, begins. The bottom of the lip is 15 inches from the foot of the dies. As in the Homestake mortar, the ore is discharged toward the head of the stamp. The lip serves also as a protector to the amalgamated copper plates below it.

The discharge-opening in front, 50 inches long by 17 inches high, begins 20 inches above the bottom of the flange. Its frame is also inclined outward about 10 degrees from the vertical. The grooves on the sides, receiving only the screen-frames and the curtain, are simpler in construction than those of the Homestake mortar. The lugs for the horizontal keys are the same. Taking the cross-section, we find the flanges 3 inches thick and $4\frac{1}{2}$ inches wide. The mortar-bed is 7 inches thick, the sides, at the foot of the dies, $4\frac{1}{2}$ inches. The inside dimensions are: Width at the bottom, 10 inches; length, $50\frac{1}{2}$ inches; height, 14 inches to the issue of mortar and pulp, where the width is 16 inches. This increases to 19 inches at the top of the discharge. The top of the mortar is $13\frac{1}{2}$ inches wide, and the total inside height $50\frac{1}{2}$ inches. The casting, from the top down to the feed-opening, is $\frac{3}{4}$ of an inch thick.

A mortar lasts six years, and wears out more on the short sides than at the back.

In comparing the two types, we see that they differ in the feed opening, as already discussed. The feeding-lip also differs, that of the Caledonia mortar being thicker and wider than the other. The increase of width is necessitated by the presence of the amalgamated copper-plate below the lip; the mortar itself is also wider at the issue for the same reason. The depth of the Homestake mortar is $8\frac{1}{2}$ inches, and that of the California mortar 14 inches. The latter corresponds with the height at which the issue of the pulp occurs. In the Homestake mortar, the issue is raised by the insertion of the chuck-block $16\frac{1}{2}$ inches above the

MORTAR AND STAMP FOR HOMESTAKE MILL.

foot of the dies, thus giving, with a shallower mortar, a deeper issue of pulp than the Caledonia mortar.

The Homestake management casts its own dies. The quality of iron used is between gray and mottled, the top of the cylindrical part being chilled. The foot-plate has beveled corners and is 10 inches long, $10\frac{1}{2}$ wide and $1\frac{1}{2}$

inches thick. The cylindrical part, or "hoss," is 9 inches in diameter and 5 inches high. The level of the die is 10 inches below the discharge, which takes place over the chuck-block. The die weighs 121 pounds (one-seventh of the weight of the stamp), and lasts about six weeks, crushing 189 tons. By that time the cylindrical part has become slightly convex, and is worn down to two inches from the foot-plate. Its weight has then been reduced to about 30 pounds; thus 48 pounds of iron are consumed for every 100 tons of rock that are crushed.

The Caledonia mill buys its dies outside. They are of chilled white iron. The foot-plate has also beveled corners, is 10 inches wide by $9\frac{1}{2}$ inches long and $1\frac{1}{2}$ inches wide. The cylindrical part is 8 inches in diameter and $5\frac{1}{2}$ inches high. While the dies in the Homestake mortar fill its bottom completely, those of the Caledonia fit perfectly in the width only, there being a three inch space in the length that has to be divided up between the five dies. The distance from bottom of screen to top of die is 6 inches. The die weighs 160 pounds (about one-fifth of the weight of the stamp) and lasts three months, crushing 300 tons of hard rock. The cylindrical part is then worn down within one inch of the foot-plate. The worn-out die weighs 38 pounds, making the consumption of iron 40 pounds for every 100 tons of rock.

Amalgamated copper plates are placed along the entire length of the mortar. In the Homestake mortar one plate is set to the discharge opening; in the Caledonia mortar there are two plates—one under the discharge, the other beneath the lip of the feed-opening.

The Homestake mills use the so-called chuck-block (half elevation, Figs. 2 and 3), placed against the lower flange and the two side flanges of the discharge. The chuck-block consists of a 2-inch plank, bolted to the back of a $1\frac{1}{2}$ -inch board, and extending from 2 to $2\frac{1}{2}$ inches above it. Its inside upper edge is rounded off, and over this, and along the inside face, a $1\frac{1}{2}$ inch copper plate is fastened with iron screws. The recess formed on top of the front board, $1\frac{1}{2}$ inches wide and from 2 to $2\frac{1}{2}$ inches deep, is taken up by the lower part of the screen frame. Between this and the front board is placed a strip of carpet to form a tight joint. The frame is held in place by a vertical piece of flat iron bolted to the center of the front board, a horizontal wedge being driven between the two. The front board has an iron facing along its lower half and two vertical strips toward the ends, to protect the wood against the two horizontal and the two vertical wedges with which it is fastened to the mortar. To the back (beneath the 2-inch plank having the sheet copper) is tacked a strip of rubber cloth which helps to make a tight joint between the wood and the flange of mortar.

Wooden chuck-blocks last six months. At this time the coppers have to be removed and put upon new blocks, or they are scraped carefully, put aside, melted and sold. Mr. R. Graham of the Homestake has replaced the plank to which the copper-plate is screwed by iron. Of the free gold, 55 per cent is caught on the inside plate. At the Caledonia mill, of the free gold, 60 per cent is caught on the inside plates. This mill has copper-plates at both front and back, the aim being to keep the pulp longer in the battery, and thus counteract the refractory character of the ore.

ACADEMY OF SCIENCES.—The Academy of Sciences held their regular meeting Monday night, with the president, Dr. Harkness, in the chair. Dr. Bahr exhibited a specimen of the larva of a caterpillar with a growth of fungus attached, found in New Zealand. No regular paper was read, and in its place J. W. Raymond made a few remarks on "Sub-Alpine Molnacs of the Sierra Nevada," specimens of which were shown.

ROBERT PROUT, with Jack and Sandy Richards, Tom Davis, John Cocking, John Rodda and John Bryant, all Comstock miners, have gone to a mine near Prescott, Arizona. They get \$3.50 a day from the time they leave, traveling expenses paid, lodgings furnished, and they to pay \$1 per day board—equal to \$2.50 per day clear, with regular work right straight along.

THERE is again talk of establishing smelting works in Los Angeles. The Preston system of working ores by the heat from crude petroleum is that which is being considered.

The Mining Companies' Financial Standing.

RUBBER FACTORY.

Monarch Belting.

The Pies of this Belt are

UNITED by COTTON RIVETS

Which hold them firmly together.

Each Rivet is Independent

And Follows the Stretch.

THERE ARE NO STITCHES

TO BREAK, and

The Belt has a Smooth Surface.

Hose, Belting, Packing, Etc.

ALL KINDS OF RUBBER GOODS MADE TO ORDER IN A FEW HOURS.

W. F. BOWERS & CO., 409 Market St., San Francisco.

To Miners, Millmen, Dealers in Machinery, Etc.

The undersigned offers for sale at greatly reduced prices, machinery belonging to the

AUTO-PNEUMATIC CAR MOTOR COMPANY,

Situate in the City of San Francisco, on the block bounded by Folsom, Harrison, Sixteenth and Seventeenth Streets. Said machinery is new and has only been used long enough to test every part of it.

One Compound Steam Air Compressor, low pressure cylinder 12x20, high pressure cylinder 5x20, with inter-cooler and all connections complete.

One Air Tank, 48 inches in diameter by 16 feet length, tested to 300 pounds to the inch.

One Auto-Pneumatic Passenger and Motor Car, 30 feet long, standard gauge, with air tanks and engine complete. Engines, Compound, 6-inch and 11-inch cylinders by 12-inch stroke.

2000 feet or more of 20 lbs rail with ties, bolts and fish plates, complete.

For further information apply to

J. C. RUED, Director A. P. C. M. Co.,

No. 119 Clay Street, San Francisco.

IMPROVED FORM OF HYDRAULIC GIANTS.

THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture. We guarantee purchasers of this form of Giants against all costs, expenses or damages which may arise from any adverse suits or actions at law. We are further prepared to furnish Single-Jointed Giants when required. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent on application.

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

HOISTING ENGINES FOR MINES

1, 2, or 4 Drums, with Reversible Link Motion or Pat. Improved Friction.

MADE ONLY BY THE

LIDGERWOOD M'FG CO.,

96 Liberty St., New York.

34 and 36 West Monroe St., Chicago.

197 to 203 Congress St., Boston.

PACIFIC COAST AGENTS,

PARKE & LACY CO., San Francisco.

Send for Catalogue.

KROGH'S MINING HORSE-POWER HOIST

Is known to be the Best Horse-Power Hoist now made. It is strong and durable.

The drum will carry 1000 feet of five-eighths steel rope. It can be used to run a pump or blower, in conjunction with hoisting, and is manufactured by

F. W. Krogh & Co.,
 51 BEALE ST.,
 San Francisco.

DELINQUENT SALE NOTICE.

Gray Eagle Mining Company. Location of principal place of business, San Francisco, California. Location of Works, Placer Co., Cal.

NOTICE.—There are delinquent upon the following described Stock, on a count of Assessment (No. 16) levied on the 21st day of January, 1890, the several amounts set opposite the names of the respective Shareholders, as follows:

School of Practical, Civil, Mechanical and MINING ENGINEERING,
 Surveying, Architecture, Drawing and Assaying
 723 MARKET STREET.

The History Building, San Francisco, Cal.
 A. VAN DER NAILLEN, President.
 Assaying of Ores, \$25; Bullion and Chlorination Assay, \$25; Blowpipe Assay, \$10. Full course of assaying, \$50.
 Send for circular.

THE PIONEER COMMERCIAL SCHOOL

Established 1863.
PACIFIC Business College,
 320 POST ST. SAN FRANCISCO.
 Oldest and Best.

LIFE SCHOLARSHIPS, \$75.
 NO VACATIONS. DAY AND EVENING SESSIONS.
 Ladies admitted into all Departments.
 Address: T. A. ROBINSON, M. A., President.

HEALD'S BUSINESS COLLEGE,
 24 POST ST., S. F.
 FOR SEVENTY-FIVE DOLLARS THIS College instructs in Shorthand, Type Writing, Book-keeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for six full months. We have sixteen teachers, and give individual instruction to all our pupils. Our school has its graduates in every part of the State.
 Send for circular.

C. S. HALEY, Secretary. E. P. HEALD, President.
GRANGER'S ROLLER STAMP MILL
 Beats them all. Works dry ores. Makes even granulation. No dead work, hence minimum wear.
 A. P. GRANGER, Denver, Colo.

GRANGER'S DRY ORE SEPARATOR
 The very best. Uses no water. No freezing up. Saves handling waste. Saves high percentage. Send for circulars.
 A. P. GRANGER, Denver, Colo.

The Rotary Snow-plow.

During this very severe winter the Central Pacific Railroad Co., in order to keep its road over the mountains in operation, has had to place almost entire dependence on the rotary steam snow shovel. Without this appliance it would have been impossible to clear the road of snow. During the heaviest of the storms, they had only one of these plows, and it was kept constantly at work, performing its office satisfactorily and to the admiration of all who had anything to do with it.

The rotary steam snow shovel, an engraving of which is shown on page 161, consists of a heavy wrought-iron frame made of 12-inch I beams, strongly braced, carrying upon its forward end a steel drum 9 feet in diameter, with a square front 10 feet wide, in which are contained 12 rotating shovels made of the best steel and arranged like an immense fan-wheel. On the front of the shovels are placed 18 two-edged knives of best steel, which reverse automatically. On the frame in the rear of the drum are located the engines and boiler which supply the power to rotate the shovel-wheel, the whole supported by two extra heavy four-wheel trucks.

The cylinders are 17 inches in diameter and 22 inches stroke, of the best iron made for that purpose. The boiler is of the best steel, 7-16 inch thick; cylindrical part 52 inches diameter; there is a wagon-top over the furnace 12 inches higher than the cylinder part, and one dome over the furnace, 28 in. x 28 in.

The fire-box is 69 inches long and 47½ inches wide, inside, of homogeneous cast steel. There are 184 iron flues, 2 inches diameter, 11 feet 2 inches long. The machine is equipped with two injectors; Richardson's balanced slide valves and double eight feed lubricators, and is furnished with gauge lamps, whistle, two safety valves, steam and water gauges, heater and gauge cocks, etc.

The material and workmanship are the same as is usual in the highest standard of locomotive construction.

The boiler and machinery are entirely covered with a substantial ash oah. The front truck is equipped with an extra wrought-iron frame, made fast on the truck frame, for the purpose of carrying the ice cutter and flanger.

The ice-cutter is hung from the forward end of the extra frame, and can be lowered to cut the ice and snow from the inside and off the top of the rails in front of the forward truck wheels, so as to make it impossible to derail the rotary shovel by ice or snow.

The flanger is hung on the rear end of said extra frame, and is so constructed as to cut within one-half inch of the rails on the sharpest curve, and works perfectly, no matter how slow or how fast it is run over the line. It will clean the flange and rail thoroughly in a deep bank or cutting. Both ice-cutter and flanger are raised by a 6x9 steam cylinder.

A number of these powerful machines have been sold and are in operation this winter on the following railroads: Union Pacific, Colorado Midland, Southern Pacific, Oregon R. R. & Navigation Co., Northern Pacific, Denver & Rio Grande, C. & N. W. Ry., O. St. P. M. & O., St. P. M. & M., St. P. & Sta. Marie, D., S. S. & A., N. Y. C. & H. R. R. R., O., M. & St. P., and other lines. They are built by the Leslie Bros. Manufacturing Co., Paterson, N. J., a new company which has taken the place of the Rotary Steam Shovel Manufacturing Co., and will manufacture various other railway appliances.

All through the "Far West" this year heavy snowstorms have been the rule; way down in New Mexico in November last the roads became blocked and a rotary snow-plow had to be sent from Colorado to get the passenger out. This was the case on the Denver, Texas & Fort Worth R. R. The same storm struck the western part of Kansas about the same time, completely blocking the western divisions of the Chicago, Rock Island & Pacific with snow, sand and ice, but the Rock Island Co. had the good fortune to own two rotaries with which they opened their line in as many hours as it would have taken days to have done in any other way, as the plow throws the snow clear away from the track by its operation.

Then the storm seemed to make for the mountains, where it made itself felt from New Mexico to Washington Territory, and clean to the west side of the Sierra Nevada and the

Cascades, not forgetting the Siskiyous and the Shastas. The first mountain road to fall a victim to its fury was the Denver, South Park & Pacific, a part of the Union Pacific system.

For several months back heavy snowslides have been frequent along this line, many of which have exceeded 20 feet deep on the track, and only those who have seen a snowslide in the mountains can realize the hardness of the compact mass the snow is driven into by these terrible slides. Yet the rotary has never failed to cut its way through these slides, only where rocks and trees have been carried down and buried in the solid mass. Notwithstanding the fact that every care has been taken to prevent the rotary from running aback of the rocks, it has been badly damaged on several occasions by coming in contact with such obstructions, buried in the hard-packed snow, making it a very difficult task to keep this line open with but one rotary.

Reports from the Colorado Midland indicate heavy snows on that line also, and notwithstanding the fact that the snow is 13 feet on the level, with drifts much deeper, the officials report that owing to the successful workings of their rotary plow they have not had a train seriously delayed up to the present time.

The Denver & Rio Grande, with two rotaries, kept their line open more successfully than ever before.

While the rotaries were fighting hard in Colorado, the terrible storms in the Sierra Nevada put in an appearance, and for days and weeks the Central Pacific Co. was enabled to keep their line open for traffic with but one rotary plow, which they purchased two years ago and had never had an opportunity of thoroughly testing until the recent storm set in, in the latter part of November last, in the Sierras, where for weeks in succession it scarcely let up for a day, spreading its wings over so much territory and increasing in its fury until it was simply impossible to cover the length of snow-bound track with one rotary, yet for days and weeks the rotary succeeded in conveying the trains backward and forward until snowslides and increased storms completely baffled the efforts of the company to keep the line open with one rotary plow.

This winter has demonstrated to the Southern Pacific Company that had they had a sufficient number of rotary plows, they need not have delayed a train. General Superintendent Fillmore was free to admit in his dispatch of January 24th that if he had had three or four rotaries, instead of only one, little delay would have been caused, and the terrible blockade on their line, during the winter of 1889 and 1890, would have been averted, which is clearly established in his dispatch of January 29th, in which he states that the rotary plow which they borrowed from the Union Pacific, to open the west end of their Salt Lake division, did more work in six hours than it would have taken 500 men to do in one week.

During those terrible storms, the rotary was in continuous service for 14 days and 14 nights, and it will be remembered that when within 300 feet of the end of the great blockade in the Sierra Nevada, the rotary was disabled. This was mainly the result of overjoy and enthusiasm, which was augmented by the cheers of the imprisoned passengers and crews of the snow-bound trains, who had concluded that it was simply impossible to disable the powerful machine. Words can hardly express the excitement and delight of the prisoners, which increased as the wonderful plow advanced, until the engineers on the powerful locomotive behind it gave way to their feelings by blowing their whistles and pulling the throttles wide open, with a view to passing through the last great mountain of snow and raising the terrible blockade with flying colors; but the extra power proved too much, and the rotary, after its gallant fight, was obliged to give way to the enormous strain before the last 200 feet had been cleared.

However, the difficulty was finally overcome, the plow repaired, and another one purchased. Mr. Fillmore's high opinion of the performance of the rotary is fully substantiated by the reports of the officials of the Northern Pacific, who claim that it was owing to the fact that they had a sufficient number of rotaries that they were enabled to run their overland trains through to the coast almost invariably on time, never having had a train more than a few hours late, and very few more than a few minutes.

Equally satisfactory reports of the work done by the rotary are made by the officials of the St. Paul, Minneapolis & Manitoba road on their line.

This is the third winter the rotary has been in use on the Oregon Railway & Navigation Co.'s line. The winter before last they got their first rotary, which proved such a success in the storms that season that they secured a second one a year ago last fall, and they claim that the rotaries never failed to do their work successfully and satisfactorily by keeping their line open for traffic, until they had the misfortune of disabling one of them in the mountains a few weeks ago. In fact it has been a success wherever used this winter.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING FEB. 18, 1890.

- 421,884.—STEERING-WHEEL CARRIAGE—Dan'l Best, San Leandro, Cal.
421,657.—ROTARY JOINT—W. F. Byers, S. F.
421,858.—PENDULUM-BAR TREADLE—E. A. Cochran, Pasadena, Cal.
421,555.—SAWDUST BURNER—F. W. Cook, S. F.
421,675.—HAIR-RESTORER—Crooks & Robin, S. F.
421,880.—WHIFFLETREE CONNECTION—O. J. Fisk, Coulterville, Cal.
421,495.—DRAWHEAD—T. W. Heintzelman, Sacramento, Cal.
421,739.—HARROW—H. L. Mack, Ellensburg, Wash.
421,886.—AXLE-LUBRICATOR—R. H. Parker, Carson, Nev.
421,881.—RAISIN-GRADER—Jas. Porteous, Fresno, Cal.
421,609.—SHIFTER FOR GANG-EDGERS—S. H. Pratt, Brownsville, Cal.
421,610.—JOURNAL BOX PROTECTOR—H. S. Pugsley, Oakland, Cal.
421,617.—PRINTERS' GALLEY—W. S. Rogers, Los Angeles, Cal.
421,882.—VISUAL ANNUNCIATOR FOR CALL-BOXES—Paul Seiler, S. F.
421,883.—MIXING APPARATUS—Geo. W. Swan, S. F.
421,453.—CUT-OFF VALVE—C. W. Tremain, Portland, Or.
421,877.—DUPLEX LEDGER-RULER—S. B. White-side, Los Angeles, Cal.
421,800.—MOUTH-PIECE FOR TELEPHONES—Whitney & Cowles, S. F.
421,885.—GUIDING ATTACHMENT FOR AGRICULTURAL IMPLEMENTS—C. W. Packard, Fresno, Cal.
17,541.—TRADEMARK, Callisto Co., S. F.

FOR THE WEEK ENDING FEB. 25, 1890.

- 422,329.—OIL BURNER—J. F. Beals, Los Angeles, Cal.
422,047.—BURGLAR-PROOF CAR—J. Beermaker, Santa Barbara, Cal.
422,283.—NECKTIE FASTENER—H. Berchling, Roslyn, Wash.
422,070.—WATER FRONT ATTACHMENT FOR BOILERS—J. T. Charest, Red Bluff, Cal.
422,124.—DRIVING REIN—M. S. Dickinson, Los Angeles, Cal.
422,013.—CANNON-WHEEL REMOVER—H. R. Eckstrom, Santa Rosa, Cal.
422,203.—BEVERAGE CARBONIZER—C. W. Gibson, S. F.
421,932.—BULLET—W. A. Heisler, Prescott, A. T.
422,131.—SHOE LACER—A. C. James, Pomona, Cal.
422,086.—VARIABLE CRANK FOR VELOCIPEDES—H. E. Lewis, Gold Hill, Nev.
422,275.—CARRIAGE JACK—T. L. Williams, Big Bend, Cal.
422,104.—DEVICE FOR LAYING OUT ORCHARDS—J. B. Yount, Dixon, Cal.

The following brief list by telegraph, for March 4, will appear more complete on receipt of mail advices:

California—Joseph R. Trico, assignor of a half to H. C. Owens, San Francisco, photographic shutter; Joseph Tomlinson Sr., Folsom, wrench; John Schroeder, S. F., gaiter boot; Almeroy W. Schmidt, S. F., shell for high explosives; Judson Rice, San Jose, heating apparatus for dissolving bituminous rock; William Pierce, Napa, gate; Eugene C. Merrill, West Oakland, car-lock; Elmer C. Jordan, Sacramento, circulator and feedwater heater; Jason W. Fairchild, Pacific Beach, quartz-mill; Emma P. Bais, S. F., polishing powder; Walter H. Eager, S. F., knife-box rubber for printing presses; T. C. Churchman, Sacramento, car-wheel and axle; Joseph Behm, San Jose, centrifugal polisher; William A. Beck, S. F., fruit-drier; F. W. Beardslee, Berkeley, farm gate.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VARIABLE CRANK FOR VELOCIPEDES.—Hiram F. Lewis, Gold Hill, Nev. No. 422,086. Dated Feb. 25, 1890. This is a mechanical movement in that class in which a crank having a variable or eccentric throw is employed. The invention consists essentially in a lazy-tongs connected at one end about the true center of motion and carrying in the other end the crank-pin and an eccentrically located lever connected with said lazy-tongs whereby they are extended and contracted, and their crank-pin thus made to move in an eccentric course. The object is to provide a crank movement of this character for use in connection with any machine to which it may be found applicable, but especially in connection with foot-power machines, such as bicycles, tricycles and velocipedes generally. Its advantage is in saving lost motion by reducing the distance of movement at the same time that the length of crank may be increased to give the necessary or desired power.

CANNON-WHEEL REMOVER.—Harry K. Ekstrom, Santa Rosa, assignor of one-half to Adolph F. Guio, Los Angeles. No. 422,013. Dated Feb. 25, 1890. The cannon-wheel of a clock is forced upon its post outside of the frame-work and so close to the plate that it is very difficult to insert a tool beneath it or remove it without damaging the teeth of the wheel, bending the post or springing the frame.

This invention relates to a device for conveniently removing this "cannon-wheel" from its post in clocks.

DEVICE FOR LAYING OUT ORCHARDS.—John B. Yount, Dixon, Solano Co. No. 422,104. Dated Feb. 25, 1890. This is a mechanical device for laying out orchards and for other like work. It consists of a mathematically adjustable frame with devices whereby stakes may be set, the holes made and the trees set in mathematical lines and in a perfectly vertical position. In laying out orchards, it is especially desirable that the trees should be so set with relation to each other as to form rows in several directions from any given point, with open roads or spaces between them for the purpose of cultivation, to gather fruit and for symmetrical appearance. This appliance lays out these spaces accurately.

WATER FRONT ATTACHMENT FOR BOILERS.—John T. Charest, Red Bluff, assignor of one-third to Joseph Marcott, San Jose. No. 422,070. Dated Feb. 25, 1890. This water-front attachment for boilers consists of an independent furnace front, which may be built into the usual brickwork of a stationary boiler, said front being made hollow, so as to contain water, and having pipes connecting its upper part with the boiler or boilers, cocks by which connection may be cut off or regulated at pleasure, tubular grates connected with the lower part of said front, and a water-supply pipe delivering water through the tubular grates, and also directly into the lower part of the front and through the bridge wall. The water becomes considerably heated by reason of the fire upon the inner wall of the furnace-front and upon the bridge wall, and the whole device serves as a water-heater, utilizing a considerable amount of heat from the furnace to raise its temperature to the proper point before its delivery into the boiler.

The Mining Bureau Museum.

The following are some of the recent additions to the collection of the State Mining Bureau: Polished quartzite, from Sioux Falls, S. D., which is quarried in large quantities and sold under the trade name of "Sioux Falls Jasper," from J. W. Foss.

Embolite (chloro-bromide of silver), Broken Hill, Australia, from Louis Janin.

Selenium, a very rare mineral, from Honduras—Charles Thistlewaite.

Topaz (group of crystals), Japan—J. Z. Davis.

Celestine (sulphate of strontium), or Colemanite, from Calico, San Bernardino county, California.

Rich silver ores from Sinaloa and Durango, Mexico, and iron ore with iron made from it, from an immense deposit in Durango, on which extensive works have been erected for the manufacture of iron—C. A. Hamilton.

Native mercury and rich cinnabar from Pine Flat, Sonoma county, California—C. A. Grimmer.

Huanjavita (argenteriferous halite), Tarapaca, Chile—M. Rosenstock.

Embolite, from same place—M. Rosenstock.

Gold quartz, Elkhorn mine, Oregon, assaying \$400 per ton—J. H. Robbins.

Gold in hematite, Golden Era mine, Sierra City, Sierra county, California—Thomas Murphy.

Anthracite coal, Cloquato, Washington—H. C. Davis.

Silver ores, from San Bernardino county, California.

A FIRE has broken out on the old slopes of the 1000-foot level of the Silver King mine, Arizona. A hulkhead has been put up cutting off that portion from the rest of the mine.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. C. HOAG—San Francisco.
R. G. BAILEY—San Francisco.
W. W. THORNTON—Los Angeles Co.
E. FISCHER—Central California.
Geo. WILSON—Sacramento Co.
E. H. SCHAEFFLE—Calaveras Co.
FRANK S. CHAPIN—Colusa Co.
ISAAC AYER—Fresno, Cal.
SAMUEL CLIFF—San Luis Obispo Co.
W. H. HILLARY—Oregon.
E. E. DRINKING—Oregon.
CHAS. M. MOODY—Oregon.
H. G. PARSONS—Washington.
R. G. HUERTON—Montana.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

Attention, Southern California Miners.

WORKS FOR SALE.
The Works are situated at Daggett, Cal., in the Calico Mining District, and on the side-track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power Engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to GILLISPY & CHILDS, 123 California St., San Francisco.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, March 6, 1890.
Rainy weather the past week interfered to some extent with distributive trade, but at the close the promise is held out of more settled weather, which will bring in its wake larger business, for stocks of goods carried in the valleys and mountain towns are almost nil. The iron-molders' strike the past week comes very inopportune, and if not soon settled, will send all work East. Foundrymen and manufacturers in general say that we must have cheaper raw material, or else cheaper labor; failing to get either, they must "shut up shop," the same as the woolen-mills are doing.

The local money market is easy, with a lessened call for funds. Remittances from the interior are coming in quite freely, chiefly from up North. The easy money market is being favorably felt in the realty market, and a speculative movement in local securities and a deal pending in some of the mining stocks.

A summary of the dividends for February compares as follows:

	1889.	1890.
Gas and Water companies	\$147,100	\$89,500
Insurance companies	6,000	4,500
Powder companies	27,000	43,800
Street railroad companies	25,000	7,500
Sugar companies	40,000	60,000
Central Pacific Railroad	650,000	650,000
Mining companies	344,250	141,500
Miscellaneous companies	31,250	40,250
Totals	\$1,800,000	\$1,006,050

MEXICAN DOLLARS.—The market has ruled dull but fairly steady throughout the week at 75 1/2 @ 76 cents.

SILVER.—The markets abroad and at the East advanced steadily up to Tuesday, when a shading off set in. The market, as has heretofore been stated would be the case, is being manipulated, by which silver bullion is made an attractive gamble. This promises to be the case while the question is under debate in Congress. It now looks as if the House of Representatives will act favorably, with some amendments on the Windom bill, but what course the Senate will pursue remains to be seen, but it will probably conform to the House bill; at any rate, it is conceded that neither branch of Congress will antagonize the other to such an extent as to defeat more favorable legislation than now enjoyed. It is now officially confirmed what this paper has stated, that China is preparing to issue a silver currency of its own. This ought to hold the market value of the metal.

Silver has held to Mint prices, 95 1/2 cents, the past week, with very little offering for sale. Exporters are still said to be out of the market. Money, a leading English financial paper, just to hand, referring to the Chinese Government scheme to mint silver, says that "should it pass into law, an enormous demand for silver would spring up, which would gladden the hearts of those interested in the depreciated rupee."

QUICKSILVER.—The market has ruled strong throughout the week. The demand for both export and domestic consumption is increasing. Receipts for the past week aggregate 539 flasks, and exports by sea 320 flasks to New York.

BORAX.—Receipts the past week aggregate 209 casks. The market is strong in sympathy with the East, where active and strong markets are reported.

LIME.—Receipts the past week aggregate 3618 bbls., and exports by sea 225 bbls. to Honolulu. The market is steady, with an increasing call reported.

CHROME ORE.—There was shipped the past week 419,000 lbs. to New York. The market is reported unchanged.

COKE.—Imports the past week aggregate 1559 tons. The market is reported fairly steady by some, while others say the tone appears to be weaker.

LEAD.—The market exhibits a stronger tone, in sympathy with an improved demand and better prices at the East. Receipts with us continue light. The past week there was shipped by sea to New York 475 kegs of white lead.

COPPER.—The market continues strong. The consumption on this coast is steadily increasing. A late London cable reports as follows: For copper there has been more demand, and purchases by consumers show some increase. A parcel of 400 tons merchant bars changed hands at £46 12s. 6d., and several smaller parcels at £46 10s. @ £47. Speculative demand has improved, and appears to be encouraged by the easier rates for money. The demand from consumers is improving, and prospects are considered favorable for a good spring trade. It is understood that the principal French holders have decided not to realize at less than £50, it being considered very likely that prices will recover, in view of the fact that North American supplies are small and that a good part of the French holdings will be wanted for consumption by present owners.

TIN.—Imports the past week aggregate 56,380 boxes plate, and exports by sea 4981 lbs to Victoria and 60,000 lbs to Santa Rosalia. The market for both plate and pig is quiet and in buyers' favor. This condition will obtain until there is a better concentration, which promises to be soon. The following is a late London cable to the *Iron Age*: "In tin plate business has been small, and Liverpool buyers are gradually tapering prices. The half-yearly meeting of the Plate-Workers Union was held Saturday, and 103 delegates, representing 72 works, were present. It was decided to cease work altogether during the second week in March, and every effort will be made to adhere to 36 boxes output in 8 hours until the stock at shipping ports shall have been reduced to 250,000 boxes. During the week previous to the meeting, makers closed 70 mills, including those of the Baldwin, Williams, Coway Bros., Lewis, Thomas, German, Fairwood, Trefores, Barry and Oldcastle Companies."

IRON.—Imports the past week quite heavy, being as follows: From Newcastle, 500 tons; Cumberland, 450; Liverpool, 36; and New York, 90; total, 1077 tons. The market appears to be unsettled, with probably an easier tone, owing to the labor strike. If this is amicably settled, or non-union

hands be employed, then prices will not go off, but if not settled, then it is quite certain there will be more or less realizing sales. European and Eastern advices report the market firmer at the recent shading in prices.

COAL.—Imports the past week aggregate as follows: Departure Bay, 3156 tons; Coos Bay, 1150; Nanaimo, 2456; Egg, 52; Newcastle, 2697; total, 9511 tons. The market for Australian spot, to arrive and for shipment, is very strong. There are only four cargoes on the way, and very few vessels to load for this port. As the wheat crop is shorter than before estimated, it is thought that freights for summer loading will be lower. Carriers, sellers' option for shipment the year, can be bought fully 1/2 below our quotations but for prompt shipment no concessions are obtained. Coast coals are more strongly held, with an advance talked of, chiefly for Wellington. The consumption of steam is increasing.

Eastern Metal Markets.

By Telegraph.

NEW YORK, March 6, 1890.—The following are the closing prices the past week:

	Silver in New York.	Copper.	Lead.	Tin.
Thursday	95 1/2	14 55	8 75	20 80
Friday	95 1/2	14 55	8 75	20 80
Saturday	95 1/2	14 55	8 75	20 80
Sunday	95 1/2	14 55	8 75	20 80
Tuesday	95 1/2	14 55	8 75	20 80
Wednesday	95 1/2	14 55	8 75	20 80

NEW YORK, March 6.—Lead is firm and higher, with a good demand ruling. Tin has fluctuated the closing week. Quicksilver is higher and strong. Borax, supply light, market strong. Copper is firm, with moderate demand; 14 1/2 @ 14 3/4; Spot Lake, 12 1/2 @ 13 c. Casting brands—Liberal sales reported. West, 14 1/2 c. intended for this point.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

MOHAWK CANAL AND IMPROVEMENT CO., March 4th. Object, to take possession of and operate the Mohawk canal, situated in the Mohawk valley, A. T. Capital stock, \$1,000,000. Directors—R. H. McDonald, Frank V. McDonald, D. S. Dorn, R. J. Davis and Dr. John C. Spencer.

OCEAN POWER CO., March 5th. Object, to utilize wave and wind power. Capital stock, \$12,500,000. F. H. Hausman, W. H. Masterman, B. S. Taylor, H. Wangenheim and H. E. Thomas are the Directors.

STATE DIME SAVINGS BANK OF S. F., March 5th. Capital stock, \$200,000. Directors—O. E. Moore, A. A. Hoyt, E. W. Bushnell, M. S. Moore, W. B. Benchley.

CALIFORNIA MANUFACTURING CO., March 5th. Capital stock, \$250,000. Directors—Norman E. Colt, Thomas A. C. Dorland, John T. Carothers, Emil Kamel and D. L. Bishop.

OAKLAND INVESTMENT CO. Object, to deal in real estate. Capital stock, \$150,000. Directors—W. J. Dingee, W. G. Henshaw, Henry R. Miller, C. Finkham and D. D. Harris.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:
Mount Diablo, March 5, \$6515; Justice, 5, \$2863; Hanauer, Feb. 26, \$2700; Ontario, 26, \$43,474; Germania, 26, \$3872; Hanauer, 7, \$4650.

Mining Share Market.

The mining share market the past week for the Comstocks was quieter at gradually settling prices, with on Wednesday a setback of from five to ten per cent. The decline was very generally looked for, yet it was not as heavy as the points were out for. Those who had watched the upward movement in the North End stocks were prepared for a decline, as the advance was made chiefly on shorts and also for the purpose of buying stocks, both of which were successful. To keep the public from buying and at the same time induce those who have stocks to sell out, assessments are being levied. Those of the outside who carry stocks might as well make up their minds to let go, for the pool wants a part, if not all they hold, and the sooner the pool gets them, the better it will be for all in interest. If stocks cannot be secured through manipulation worked by points, then probably the old deadlock racket, with plenty of assessments, will be put in force, which soon fetches what is required. Outside of this, the situation at the mines is far more encouraging than for years past, and if desired by the pool, there can be no doubt but one or more rich ore bodies can be shown up. The Tuscarora stocks are very active; they show an unusual degree of vitality, and by their fluctuations offer special inducements to speculators, yet the moneyed public are afraid of them, owing to the ore veins being quite narrow, and not extending down in sufficient width to any great depth to justify working below certain levels. Another thing against them is the discount on silver. Upon the bullion, a little over \$109,000, sold in last month by the Commonwealth Mining Co., was over \$57,000. This gives an idea of one of the serious disadvantages under which the Tuscarora pool labor in their attempt to market their stocks. The Quijotas and the Bodie remained at blackboard prices.

In reply to a patron, we will state that the increase in Bodie surplus cash is due to the remittance by the company's New York agent of money collected on the last assessment. The amount received indicates that about 30,000 shares are held in New York City.

The superintendent of the Andes Mining Co. reports two miners at work. These two forlorn men must have a hard time in allowing a sufficient excuse for the following officers' salaries to be paid regularly: President, secretary, superintendent, foreman, engineer, carman and watchman; no wonder the assessments roll around as regular as clock work.

Official advices from the Bodie mine report that the water is on the 900-foot level, which level in consequence is abandoned. If the water continues to rise, the mines will be forced to work on the surface.

From the mines we are unable to get any very reliable private news. The center of attraction now appears to be the Ward shaft and adjoining mines, Seg. Belcher. On the 550-foot level in Ward shaft they are reported to be drifting to make connection with Potosi with every prospect as the work progresses, of running into a body of rich ore. In Potosi an upraise from the 930 level has for two weeks past been in ore assaying over \$25 a ton. In Belcher and Seg. Belcher the work is of a very important character. Both Potosi and Belcher will be assessed probably to counteract any improvement that may be reported in the mines. More active prospecting work is under way in Hale & Norcross. In Union to the East they ran into rich ore; probably this brought out the assessment. All mills on Carson river are running full time. This month's bullion output of Savage, Hale & Norcross, Crown Point, Overman and Chollar, will be larger than for years. The managers of Overman are officially reporting the car samples assays of ore. This is as it should be. Other companies might, with credit to themselves, do likewise. From the Quijotas mines there is nothing new to report. From the Bodies, our private advices are very encouraging regarding the work going on in Bodie on the 700 and 800-foot levels. It now begins to look as if something of value is liable to be run into. From the Tuscaroras our news is of the very best and accounts for the activity in the stocks.

The yield of gold mines in Kern county during 1889 is estimated at \$75,000.

BAND COUPLING.
Best in the World. Most Simple in Application. Most Powerful—Cheapest. Ball and Socket Joint. Right and Left Screw. Works Freely. Just the thing for Large Tanks in a Dry Climate.

WELLS, RUSSELL & CO., Tank Builders,
Mechanics' Mills, Cor. Mission & Fremont Sts., S. F.

AMERICAN MACHINE AND MODEL WORKS.
GEER CUTTING, ETC.

MACHINE TOOLS.
We have sold the most of a car-load at a profit sufficient to warrant the sale of the remainder at Eastern cost prices. The balance consists of one second-hand foot lathe, one Planer, one Drill press, large and small Screw Cutting Lathes, one Blacksmith's Bellows, Shafing, Belling, etc.

I. A. HEALD,
108 Main Street, San Francisco.

A MIDDLE-AGED MAN BY THE NAME OF JOSEPH McLEARN, Miner, left Nova Scotia 17 years ago for California. His friends would be thankful to any person who could give any information concerning his whereabouts.

THOROUGHLY COMPETENT MILLMAN AND
Assayer of 20 years' experience in putting up and running Gold and Silver Mills and Concentrators. Works desires a situation in Mill or to take charge of Mill and Mine. Best Reference. A. H., Box 2517, San Francisco.

Paul's Dry Amalgamating Barrel Process.

The undersigned is prepared to erect, or furnish drafts for erecting, machinery, also instructions for working ores by the new patented DRY AMALGAMATING BARREL PROCESS. I assert the ability to overcome EVERY difficulty connected with amalgamating the precious metals, more especially gold, and to add from 25 to 100 per cent to the FREE GOLD yield of any mill working WET. Being the original inventor of dry amalgamation, I have spent over 30 years perfecting the system, now brought to a wonderfully efficient, inexpensive and practical one. Having patents, I caution all parties against infringements. For further particulars, address

ALMARIN B. PAUL,
Middle Creek P. O., Shasta County, California.

The Best Mining District On the Pacific Coast! GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is
THE TIDINGS.

Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.

Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.

DAILY, \$6 00 a year, WEEKLY, \$2 50, in advance.

THE ROLLER ORE FEEDER

(Patented May 23, 1882.)

This is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in
adjustment than any other. Feeds coarse ore or soft clay
alike uniformly, under one or all the stamps in a battery
as required.

In the Bunker Hill Mill it has run continuously for two
years, never having been out of order or costing a dollar
for repairs.

Golden State and Miners' Iron Works,

Sole Manufacturers,

A NEW AMERICAN BOOK — ON — Minerals, Mines, and Mining RECENTLY PUBLISHED.

A Practical Manual of Minerals, Mines, and Mining: comprising suggestions as to the localities and associations of all the useful Minerals, full description of the most effective methods for both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL.D., author of "The Metallurgy of Iron and Steel" illustrated by 171 engravings. In one volume, 8vo, 387 pages. Price \$4.50, by mail, free of postage, to any address in the world.

CONTENTS. PART I. MINING, MINERALOGY, AND ECONOMIC TREATMENT AND HISTORY OF THE USEFUL MINERALS. Mining, Mineralogy, Preliminary Principles and Preparations, Economic Treatment and History of the Useful Minerals, Gold, Silver, Copper, Nickel, Iron, Tin, Zinc, Lead, Manganese, Platinum, Iridium, Mercury, Antimony, Bismuth, Chromium, Cobalt, Corundum and Emery, Pumice Stone, Infusorial Earth, Opuntia, Bauxite, the Diamond.

PART II. MINING WORK AND ARCHITECTURE, INCLUDING VARIOUS SUGGESTIONS, WITH DESCRIPTION OF ASSOCIATED APPARATUS AND MACHINERY. Mining Construction and Machinery. [This part comprises 90 pages, illustrated by 165 engravings, with details too full to be comprised within the limits of this advertisement.]

APPENDIX. Sinking Artesian Wells, Oil and Gas Wells. Index.

An illustrated circular, 4 pages, 110, giving the full Table of Contents of this volume, will be sent free of postage to any one in any part of the world who will apply by letter.

The above or any of our Books sent by mail, free of postage, at the publication price, to any address in the world.

Our New Revised Descriptive Catalogue of Practical and Scientific Books, 86 pages, 8vo, and our other catalogues and circulars, the whole covering all of the branches of Science applied to the Arts, sent free, and free of postage, to any one in any part of the World who will furnish his address.

VAN DUZEN & TIFT, CINCINNATI, O.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$900, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 30 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Orass Valley, Nevada Co., Cal. }
ORASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.
Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

Dewey & Co.'s Scientific Press Patent Agency { ESTABLISHED 1860

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class
Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal
nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original
cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies
the information accumulated through long and careful practice before the Office, and the frequent examination of
patents already granted, for the purpose of determining the patentability of inventions brought before us, enable
us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not
new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

Smelter For Sale or Exchange.

Marble.

Owing to the violent geological agencies which have been in operation since the formation of the marble deposits in California, the stone is found broken and shattered in many cases, so it is difficult to obtain pieces of large size free from cracks. This is the case in some of the deposits in Kern, Los Angeles, Monterey, Nevada and Plumas counties. In some other places, however, good quarries are found, notably in Inyo county, where the quarry is turning out good marble in blocks of any required size. Some found near Teheocapai, Kern county, and some from near Colfax, Nevada county, is also good.

Vermont is the leading marble producing region of the United States. There are in that State immense beds of great thickness. The stone occurs in beds usually but a few feet in thickness, which vary considerably in color, so that several grades, from pure white through greenish, bluish, and almost black, may be taken from the same quarry.

As a rule the best marbles in Vermont occur where the bedrock strata stand at high angles, as at West Rutland. The quarries themselves at this village lie along the western base of a low range of hills, which, to the ordinary observer, give no sign of the vast wealth of material concealed beneath their gray and uninteresting exterior. In quarrying, the best beds are selected, and upon their upturned edges excavation is commenced, first by blasting, to remove the weathered and worthless material, and afterward by channeling, drilling, and wedging; no powder being used lest the fine massive blocks become shattered and unfit for use. The quarry thus descends in the form of a rectangular pit, with almost perpendicular, often overhanging, walls, to a depth of sometimes more than 200 feet, when the beds are found to curve to the eastward and pass under the hill, becoming thus more nearly horizontal; in following these the quarry assumes the appearance of a

vast cavern from whose smoke-blackened, gaping mouths one would little suppose could be drawn the huge blocks of snow-white material lying in gigantic piles in the near vicinity.

An interior view of a West Rutland marble quarry is shown on this page. It was drawn from a photograph, and we reproduce the view from Geo. P. Merrill's report on "The Building and Ornamental Stones in the U. S. National Museum."

Some of the quarries have been partially roofed over to protect them from snow and rain, and seem like mines rather than quarries. The scant daylight at the bottom is scarce

sufficient to guide the quarryman in his work. As one peers cautiously over the edge into the black and seemingly bottomless abyss, naught but darkness and ascending smoke and steam are visible, while his astonished ears are filled with such an unearthly clamor of quarrying machines, the puffing of engines, and the shouts of laborers, as is comparable with nothing within the range of our limited experience.

The stone taken from the quarries is worked up in the companies' shops in the immediate vicinity or shipped in the rough as occasion demands. The supply is used for monumental, decorative or statuary work and general building.

THE LIDGERWOOD IMPROVED QUARRY HOISTING ENGINE.

An Improved Quarry Hoisting Engine.

The Lidgerwood Manufacturing Company of 96 Liberty street, New York City, manufacturers of hoisting machinery, are making an engine specially designed and adapted for heavy hoisting purposes in quarries, etc., known as their Improved double-cylinder reversible link motion hoisting engine. The engraving on this page will give our readers a good idea of the general style and appearance of this machine. Its construction embodies all the latest improvements made in the well-known Lidgerwood type of hoisting engine, and its design is based upon the suggestions of the most experienced quarrymen in the country. The Lidgerwood Manufacturing Co. claim it is the most perfect and complete engine ever built for quarry-hoisting. It does away with the complicated system of blocks, saving time and trouble, as the hoisting is done with a single direct line.

The engines are of the Improved double-cylinder reversible link motion type, with throttle valve connection, mounted upon an extra strong and solid cast-iron bedplate, and are handled by simply moving the upright lever to start, stop and reverse them. The drum shaft is of hammered steel and the drum is of cast iron turned off true and smooth, of large diameter and is extra heavy and substantial. It is connected with the engine through a train of gearing of great strength, which on the drum and intermediate shafts is double, thus equalizing the strain and decreasing the wear. A powerful foot-brake is applied which will hold any load the engine will hoist. There are two changes of speed, effected by means of a small and a large driving pinion on the crank shaft, either of which may be operated by a clutch between the two, as by moving it along the shaft it will engage with either pinion.

The engines are particularly simple in operation, as all that is necessary is to throw the clutch into either the fast or slow speed gear and hoist, hold and lower the stone by simply

(Concluded on page 189.)

Mines of a Rainless Land.

NUMBER III.

Silver and Saltpeter Deposits of Iquique.

[Written for the PRESS by DON JUAN.]

In my last letter of Jan. 4th, I promised to take you through some of the most important mines of Santa Rosa de Terafaca, which I will now do. Santa Rosa is one of the most productive mining camps in Chili. It is situated about 11 miles from Iquique in a southeasterly direction, and about seven miles south of Huantajia. Our way to Santa Rosa is, of course, again over the dreary pampas described in my last letter. Midway between Iquique and Santa Rosa, we pass through El Mineral de Carmen, and here we note the very important mines of La Carmen, La Mina Bandera, Argentina and La Mina Margarita. La Carmen, shortly before my visit, had been bought by an English company. It has been in its day a very productive mine, at one time employing over 500 men, and some very rich ore has been taken out. But the work was prosecuted, as in nearly all these mines, in a very primitive way. All the ore and waste was taken out on the backs of the South American mule—the peon—in sacks made of raw-hides. The Carmen is exclusively worked through a sort of an incline shaft with steps cut in the footwall of the lode upon which the peon wends his weary way, carrying the treasure from the bowels of the earth to the surface. When one looks at the dumps of some of these mines, and sees, as is the case with the Carmen, some 300,000 tons of very low-grade ore, one will hardly believe that all this weight has been carried up hundreds of feet from below on the backs of human beings. But such is the case. Some of these *Chiftons* are in from 800 to 1500 feet, but the vertical depth attained is very moderate compared with distance run. At the time of my visit to the Carmen, the owners were experimenting in the wet sorting of the ore. The water for this process has to be carried on mule-back a long distance, and costs from eight to nine cents per gallon. It was soon found that this was too high a price to pay for water, and the dry method was again resorted to. La Mina Bandera Argentina, a very good mine, is owned by the English Consol of Iquique. It employs about 20 men. It is under the efficient management of Mr. Carbis of Cornwall. It is producing some very high-grade ore of silver, with strong indications of copper being present.

From the Argentina we pass through the Margarita, where we meet Mr. J. C. Jens, M. E., as administrador. This is a new property owned by a Santiago company. The ore is galena and running as high as \$3000 per ton. At present some eight or nine tons per day are extracted and shipped to Iquique. The new shaft which is now being sunk is down 200 feet, and looks more like mining than anything in the vicinity. A *malacata* is now being built, and more men daily put on.

From La Margarita we proceed to Santa Rosa. The first mine here of any note is La Florida, owned by a German company, and employing about 40 men. The shaft is down 300 feet, with 80 feet of east and 60 feet of west crosscut. There is a drift in on the north lode over 600 feet, and on the south lode some 400 feet of drifting has been done. The ore is of very high grade, running up to \$10,000 per ton. The average width of the vein is from 8 to 10 inches. This company is now putting up a 10-horse power boiler and engine and constructing some very good houses for their men and officers.

The next mine visited was La Grande, by far the richest mine in the camp. It is employing about 150 men. The main shaft is down 600 feet, and there are over six miles of workings. At the time of our visit we were shown over \$70,000 worth of ore in the ore-house, over which a guard is kept night and day. The ore is hauled to Iquique three times a week, and a guard is sent along with each cartload, and it is needed, too, in this country. The American Consul, Dr. Merriam, owns a large part of this mine, and it is very good property to have. It has been worked for over 200 years, and is reported to have produced over \$150,000,000. It has in 120 years paid a royalty to the Kings of Spain of nearly \$40,000,000. Next to La Mina Grande is La Mina El Rey, once the property of a Spanish King. It is from this very mine that one of the most magnificent specimens in the Spanish museum at Madrid was taken. Its weight is over 9 quintals, and it has a surface of nearly 3 by 8 feet. I would like to be able to present a specimen like this to your valuable museum of the Mining Bureau at S. F., but am afraid they would be too modest to accept it. El Rey is at present employing only six men, and very little ore is being taken out. The lower workings are in a very bad state, and too dangerous to be reopened. In my next letter I will take you through La Buena Esperanza, also a very rich mine.

COLORADO is to send out a traveling exhibit on the same plan as "California on Wheels."

Butte, Montana.

The Most Extensive Mining District on the Continent.

[Written for the PRESS by R. G. H.]

The continued progress and development of the mines in and around Butte has never been the outgrowth of mining-stock speculation, and in consequence the development has, in many cases, been slow, but the merit of the mines is the only incentive that the miners of Butte care to crowd their muscle against. It is not a case of how many shares of treasury stock can be floated at perhaps one-tenth or one-twentieth of their par value in order to keep up a fine general office and a retinue of salaried officials; but how many tons of ore can be selected and shipped to reduction works and how many ounces of silver will it yield to produce the coin to meet a regular pay-day. This is the basis that most of the remunerative mines of Butte have been operated upon, and I will endeavor to show you in a measure what that progress has been in the past four years.

Four years ago it came in my line of duty as a traveling correspondent for the MINING AND SCIENTIFIC PRESS to furnish you an occasional screed concerning Butte, the many mining enterprises and their plants, etc. The taking up in detail of each company and individual carrying on mines in Butte now would no doubt take up too much of your valuable space, yet a brief description of some of the most important enterprises would be of interest to your readers. The motto of every mining company in the district has apparently been "Excellence," for in all, their shafts have been sunk deeper and widened out to two and three compartments. Levels have been run, I might say, by the mile, ore chutes put in and stopes opened, giving room and place for more men to be operated. Mills have been enlarged and new smelters built and more capacity added to the old ones. Agencies for outside smelting and reduction works have been established and all are doing all their capacity will admit.

The Anaconda, for instance, four years ago, was shipping 1200 tons of ore daily to the smelter. Their capacity to-day is 3000 tons per diem, but on account of the fire in the lower levels of the Anaconda and St. Lawrence mines they are only shipping 1800 tons at the present writing. This all comes from the Chambers Syndicate mines, also owned and operated by that company. In 1886, it was estimated that 3000 men were working in and around the mines of Butte. It is safe to say that that number has fully doubled and every industry in connection has prospered accordingly.

What other mining or manufacturing town on the continent is there that could have two of its most extensive companies closed, as is now the case with the Blue Bird Con. and partially so with the Anaconda Co. and yet scarcely feel the effects?

The Blue Bird Mining Co.'s elegant 90-stamp mill has been closed for months on account of litigation, and the judicial authorities have been in such a turmoil over the disputes in regard to the validity of the late election that many months more may pass before the matter can be properly adjudicated.

A close calculation will show that at least 1000 more men would be required to fill these two vacancies. Many of the old employees of these companies are taking this as a most opportune moment to pay visits back home, East, or in foreign lands. Others who have bought or located properties of their own are profitably filling in the interim in developing their own properties, and as the whole country for a radius of six miles is one continuous network of leads and veins of quartz, they are likely to do full as well as if they continued regularly at wages. The Summit Mining District, as it is called, is a phenomenal one, as there are hundreds of veins of quartz—some large, some small, containing gold, silver and copper in greater or less quantities, silver and copper predominating. Yet almost every mine in the camp carries more or less value in gold.

The railroad facilities are being rapidly increased to meet the very much increased wants in this line, and instead of only having one direct connection east and west there will be three—the great Northern (better known as the Manitoba), the Union Pacific, and within two months the Butte & Gallatin Cut-off will be completed, placing Butte a few miles nearer St. Paul than Helena via the Northern Pacific. Several other roads are making good time heading for Butte. The enormous traffic in merchandise and supplies for the population and mines of Butte and the tonnage of copper matte shipped from here yearly attract the live railroad men, and they are reaching for a share of it.

The mills and smelters at Butte are without exception operated on their own ore, and the leasers for the most part are compelled to ship their ore to outside reduction works. This compels them to pay freight and cost of treatment, and it appears to me that there is here an excellent opportunity for some enterprising man to erect reduction works for custom ores alone. This should be on strictly modern ideas, with a view to save every expense both in handling the ores and supplies, and thus reduce the expense to a minimum, and by reducing the cost of treatment it would bring an enormous amount of ore into market that Butte miners never have touched for the reason that they

could not break it and transport it, pay for treatment and have a margin left.

There is an immense quantity of this character of ore in the camp, and sooner or later some one will inaugurate an enterprise of this kind. I, for one, believe that it will be made a profitable investment, under a level-headed management and with sufficient capital. The railroads have switch-backs and tracks laid now to all the mines that are producing ore in sufficient quantities to make it an object, and the mills in Walkerville that three years ago were paying for teams transferring their coal and salt from South Butte, now have the cars switched right in to their coal and salt bunkers. Of course the railroads do not switch cars up a steep grade for the fun of the thing, yet it is much more economical and convenient than the old-fashioned way. The population is, of course, increasing as rapidly as the prosperity of the district demands. The latest estimates place it between 35,000 and 40,000, and I am of the opinion that it will reach the latter number. From the present outlook, the 1st of January, 1892, will see Butte with over 50,000 people.

The town itself has never had what might be termed a building boom. During the past year many very handsome two and three story brick buildings have been added to the town, and the real estate men are apparently taking hold of home investments. A large amount of building is already in sight for this season. Rates of interest are too high to foster much extravagance of this kind. This has been caused mostly by an uncertain feeling in titles, but since the Smoke House lode matter was settled, there is more firmness in the values here, and if a capitalist or his agent was to locate here with ample capital, he would have no trouble in realizing from 1 per cent to 1½ per cent on his money, and need take no chances on titles whatever—only loan where the title was as good as warranty.

A new water company has made an application to the council for a franchise; a new electric-light company is also about ready for business, and many other new enterprises are being inaugurated, all owing to the continued increase in the ore product and absolute needs of the enlarged commonwealth. The taking out and throwing into the world's wealth coffers of over \$22,000,000 in one year from a low-grade ore camp such as Butte is well known to be, means the disbursement on the spot of an immense sum of money monthly. Most of this finds its way into the channels of trade and creates commercial prosperity.

Roads and Roadmaking.

EDITORS PRESS:—I see by a recent number of the PRESS that the best system of roadmaking is open for discussion. We are muddled in again and the mud-plow is off the track and is laid up for repairs for the time being, and my mind wanders toward roadmaking. It is natural for us when we have had roads to see the necessity of having good roads. Just such a winter as this develops all of the bad places in the roads, and we can see where it is necessary to turn the water from the road and to make ditches for the same. Poor roads may be a blessing to some, but to those who live 12 or 15 miles from a railroad it is quite a hardship to travel through the mud that distance. In the first place, we are all interested in having good roads—not only the country people but those of the city as well. The city man likes to go out in the country for an airing and try his fast horse; so you will observe all are interested more or less.

Now for the best system. I fail to notice any general plan offered as yet, therefore I will make a few suggestions. In the first place, we want a general system to work by. Perhaps the same system would not work well in all sections. In the first place, the county supervisors are supposed to have the control of the finances of the county and to look out for its best interests and apportion the funds to the best advantage. If that is so, then why not devise some general plan for working the roads in each county, and require the road overseers to work to the plan adopted by the board, and not do as we usually do, go as you please? Every road overseer has a plan of his own to work the roads by; in consequence we work to a disadvantage.

In the second place, all new road work should be let by contract to the lowest bidder. If there is half a mile of road to be thrown up and graveled, or a new bridge to be built, let it to the lowest bidder. Plenty of men can be found to take the job and do it according to contract, thereby making a saving to the county, and you would get more road work for the amount of money expended. There are no two roadmasters that work the roads the same way. Some will argue the best way is to gravel the roads without throwing them up first, by dropping the gravel in the center of the road, which has been worn out by travel from one foot to 15 inches lower than the outside of the road. When the rains come the water of course will run to the center and soften the roadbed, and the consequence is that your gravel has gone out of sight and you have nothing to show for your labor and money expended. You can see that kind of work all over this county. It is useless and money thrown away. Such a road will only last for a year or two, then you have to gravel again.

I believe it would be a great saving of labor and money to have some general system to work under. The question might be asked:

What constitutes a good road for all seasons of the year? As far as my observation goes, and I have traveled the roads more or less for the last 60 years, and all kinds of roads at that, the best valley road that I have seen for all purposes is one that has been well graded up in the center, with ditches on each side to carry the water, and culverts whenever necessary to carry the water from the roads. Such a roadbed should then be well graveled. By adopting that plan you will have a dry roadbed at all seasons of the year, and a road that will last for years, with a little care, and it will be a pleasure for the tax-payer to travel over the road and see where he has got good value for the money expended.

I would make another suggestion for county and valley roads, and that is to grade up well—say 30 feet wide from ditch to ditch. This grading should be done in the spring, after the heavy rains are over. It will pack and be in good condition to gravel in the fall before the rains set in. I would drop the gravel a little to one side of the center; by doing so you will have left a good summer track, which horses prefer to travel over during the summer months. This method will be a great saving of gravel, also of horseflesh and shoeing.

The most expensive part of roadmaking is the gravel. It costs from 50 cents to 2 dollars per load, owing to the distance you have to haul. So you see it should be used to the best advantage, and we cannot have good roads in the valley in the winter without gravel.

Danville.

B.

British Columbia Coal.

The British Columbia inspector of coal announces that during the year the following mines have been operated, their respective outputs having been: Nanaimo colliery, 223,870 tons 18 cwt.; Wellington, 273,333 tons; Union colliery, 31,204 tons. The total output of the year was 528,407 tons 12 cwt., the coal on hand on January 1, 1889, having been 10,922 tons. The exports of these collieries were 443,675 tons; home consumption, 124,574½ tons, and on hand 1st January, 1890, a little over 22,504 tons. The statement shows the output and export of coal from 1887 to 1889:

	Output.	Export.
	Tons.	Tons.
1887.....	413,360	334,889
1888.....	480,000	265,714
1889.....	528,407	443,675

The following statement shows the various sources, with quantities, of their supply of coal to the State of California from 1887:

	1887.	1888.	1889.
	Tons.	Tons.	Tons.
British Columbia.....	324,949	345,631	417,904
Australia.....	155,649	271,612	408,042
England and Wales.....	91,238	128,167	32,880
Scotland.....	12,616	16,680	12,727
Eastern States (contract, etc.).....	24,102	30,118	18,950
Puget Sound.....	569,710	568,918	374,614
Coos Bay and Mt. Diablo.....	39,155	81,194	87,000
Japan.....	13,808	1,940
Totals.....	1,217,428	1,418,208	1,351,957

Appended are the respective colliery returns, with a list of questions submitted by the examiners in Nanaimo under the "Coal Mines Regulation Act."

IRON SANDS.—A process for amalgamating the New Zealand iron sand has, a correspondent of the *New Zealand Herald* states, been discovered by Messrs. Minett & Jones. The flux used and the process are, of course, kept secret by the inventors until protection is secured. The process has been a complete success, and had been carefully proved in bulk. Mr. Minett has watched the operation, step by step, himself, and this has been done with the most satisfactory result. A quantity of the calcined iron sand and flux has been brought to Hamilton. These were in pieces about two-thirds the size of a brick, but much lighter, and comparatively porous like coke. When pounded up, the debris readily attached itself to a magnet, which would take up, if worked long enough, the whole of it. The fluxed iron sand is now ready for the blast furnace, and Messrs. Minett & Jones are preparing a temporary furnace, when the fluxed material will be run off into pigs. The correspondent further states his belief that there is no doubt that the true flux for the New Zealand iron sand has been discovered. The mechanical difficulties in smelting are overcome, and he says New Zealand has before it the great future of being the producer to an unlimited extent of the most valuable iron the world has yet seen.

PROSPECTING FOR COAL.—John Dolbeer of San Francisco, who has become interested in Elsinore, San Diego county, has associated himself with J. D. Huff, and they have entered into a contract with the Denver Diamond Drill Co. to bore for coal upon a tract of land they have purchased there, and which they are satisfied contains an immense deposit of fuel. The drill is to be sent 2000 feet and more if necessary. Work is to commence as soon as machinery can be put on the ground. As this is the first diamond-drill test on the coast of Southern California, the result will be watched with interest.

THE Anaconda Company, Montana, has made arrangement with the Silver Bow Water Company to purchase all the water that can be spared, and this will be turned into the mine. It is thought that it will take two months to flood the burning mine.

Mining-Camp Blackmailers.

How They Have Kept Back Coeur d'Alene. The *Wardner News* has the following story to tell, which is one that fits other mining camps on this coast as well:

The honest miner is a personage the Western man for years has loved to honor; he exhibits the truest types of manhood and is held in the highest esteem by all who know what it is to battle with fortune and pluck the laurel wreath of success in an honorable and legitimate manner. Such men are worthy of all praise for the part they have taken in the development of our country. Through their enterprising new communities have sprung into existence, thriving and populous camps have been created, and the people realize how deeply they are indebted to them for their present prosperity and the fond hopes they entertain for future success. But in all communities black sheep are found, and Coeur d'Alene is no exception to the rule. Since its early settlement we have been afflicted by the presence of individuals calling themselves miners, who have had no other object in view but to live on the success of legitimate mining men, and when chance occurred assert their claims to the ownership of property on false pretenses for no other purpose but the levying of blackmail, and failing in that, to involve the property in litigation. Thunderbolts of invectives have been privately launched upon the heads of such aggressors, but for various reasons no one has been found willing to publicly lift his voice in reproof of their conduct. The barefaced persistence in their reprehensible course, and their apparent disregard for the principles of common justice, suggest inquiry, and the *News* knowing the condition of affairs would have resented it in its duty to its readers and the public if it did not cry aloud against the existing evil. To keep silent any longer would be to pursue a course inimical to the interests of our vast mining regions and would be only a manifestation of cowardice unworthy of the press.

Capitalists and men willing to invest are scared from their good intentions by the constant acts of such blackmailers. Such individuals are paralyzing the industry of Northern Idaho at present. Their acts create suspicion and cause unnecessary delay in the development of valuable mining property; they incommode the owner, destroy the confidence of the stranger, and in many cases involve litigation that is costly and injurious, while it never fails to result in disadvantage to all.

Yreka district can be cited as an example of the evil effects produced by the operations of those unscrupulous blackmailers, and the closing down of the famous Bunker Hill and Sullivan mines furnishes an undeniable illustration. Work was suspended on the property last April with a view to opening up the main or lowest tunnel in order to prepare the mine for more extensive operations in the extraction of ore, and also to determine the continuity of the ore developed in the upper workings, which up to the present period is uncertain. At the time of closing, the ore had diminished in grade but increased in body, and the owners concluded that the only system to insure a profit was to operate on a large scale with an economical plant, run by water and electric power, with tramways and all other modern and approved devices. At that time the company had completed all arrangements for the erection of a mammoth mill on the South Fork; a contract was made with the Cameron Brothers to furnish 1,000,000 feet of lumber, but all further progress ceased on account of an injunction on the Sullivan mine, granted without any hearing in the matter. This was obtained on the affidavit of a party who had been, and was at the time, an employee of the company.

About six months prior to the granting of the injunction, an entrance was surreptitiously gained to the mine through doors that were locked, and in that way a survey was made. This injunction prevented work in the Sullivan on the dip of its vein, and in consequence all further operation was stopped in the lower tunnel, paralyzing at the same time other development on the property. Quite recently an attempt was made to jump a piece of ground adjoining the Sullivan, the title of which has never been disputed. Two location notices were recorded in Murray prior to any notice being posted on the ground, any stakes being driven or any discovery made. The ground on which the discovery was claimed was, at the time, covered by a big snowslide. The intent of such a scheme is at once apparent, and with just as much reason, frash locations of the entire property might be made. The company has determined to expend no more money until absolute protection by law is insured, for if they have no right to the ground, what profit could accrue from further investment? Mr. Reed came here in good faith, paid a large figure for the mines and expended nearly \$1,000,000 in purchase and improvements, taking every precaution from the start to buy up all conflicting titles and paying cash therefor. In this connection it can also be stated that he bought two pieces of property for which he had to settle twice, second claimants appearing after the first settlements were made.

These incidents are prominent among many that can and will be cited in support of our assertions. Wardner has suffered sorely from the effects of blackmailers, who in the main are nothing but barroom bums waiting their opportunity to pounce on the property of good men, and to accomplish their ends are ready

and willing to swear to anything. Wardner to-day should be the most prosperous camp in the entire Northwest; it is surrounded by the richest mines on earth, and the present comparative stagnation in mining matters is alone attributable to the villainous attempts of unscrupulous persons to exact blackmail. If we are to be run over by such characters and the press refuses to ventilate their proceedings and the people and the law fail to support honest men, we might as well strike our tents and seek new scenes. But better things are in store for us; a day of retribution is at hand and the ruthless invader of others' rights will soon learn his course is run in Coeur d'Alene.

The Postal Telegraph.

Mr. Norvin Green, President of the Western Union Telegraph Company, has appeared before the House Committee on Postoffices and Post-roads, where the bill for establishing a postal telegraph in connection with our mail service is now under consideration. According to his statement, the postal telegraph monopoly of the United States owns one-third of all the telegraph lines of the world and handles one-third of its messages. Here is an admission that alone may well startle the whole country with alarm. Like Victor Hugo's graphic description of the devilfish, this one monstrous monopoly, from its office on Wall street, has its fangs and tentacles fastened upon the social life and industrial activity of more than sixty millions of people.

The dragon then proceeded to show its mouth and teeth, and as it is a specimen of ancient animal life, a sort of magathetism, that has long managed to maintain its existence in the struggle of life with nobler creatures, but is destined soon to pass away, it may be interesting to watch its squirmings and writhings.

We are told that people are not asking for the postal telegraph. It is not very likely that as slow a body as Congress would move in this matter if the people were quiet and content. Would Mr. Green be willing to submit this question to a vote of the people?

We are told that the Baltimore and Ohio Telegraph Co. went into the cheap postal business and got smashed, and if the Government attempts to furnish cheap rates it will be in danger of entangling itself in enormous financial burdens. The sinister amiability of the attempt to frighten reminds us of a little French fable, wherein a farmer convokes all the tenants of the barnyard, and with sweet solemnity says: "Dear animals, I have assembled you here to advise me what sort of sauce I shall cook you with." "But," exclaimed an insurrectionary chicken, "we don't want to be cooked and eaten at all." To which the urbane Chairman replied: "My child, you wonder from the point." So we call Mr. Green to order, as wandering from the real issue, when he states that the United States Government cannot manage the postal lines any more satisfactorily and economically than these companies; that the question of cost cuts no figure in the case. The fundamental idea upon which the postal system of the United States is based is not that of revenue, as is the case with most European Governments, but to disseminate intelligence, accommodate the people, encourage trade and commerce, strengthen the ties of friendship and intercourse and give stability and vitality to our social and political fabric. In most of the European countries the postal service is conducted so as to raise a revenue, and therefore it is necessary to look carefully into all the details of the service as a means of supporting the Government. But here the case is wholly different. There is no reason whatever why our postal system should be self-supporting. We do not look to it as a source of revenue to meet the current expenses of the Government. Taxes from other sources, on the luxuries of life and sundry articles of foreign production which come into competition with home products, are more than sufficient to meet the ordinary expenses of the Government, including the annual deficit of the Postoffice Department.

Then it may be added in this connection that while the postal service of this country is not run for revenue, it is a significant fact that the decrease of postal rates has ever been followed by an increase in the revenue of this department. Postmaster-General Vilas, in 1887, reported a gain of \$4,840,000 in this service over all preceding years, and predicted the time was near at hand when the service would be self-supporting. This prediction is now so near verification that there is actually a bill pending to reduce letter postage to one cent. Now in the light of these facts the additional expense of the postal telegraph to this department will create no alarm, but rather inspire confidence in the measure.

This is a progressive nation—none more so. With our progress it is right that our legislation should gradually tend to reduce the burdens of the people in all possible ways consistent with good government, and cheap postal service that touches life at every point every hour in the day should be ranked among the most indispensable necessities of our business and social welfare.

Let the people on this coast who believe in a Government postal telegraph system make the fact emphatically known to their delegation in Congress, and give them a solid backing in the matter of progressive legislation,

Municipal Problems.

The questions have gradually been taking shape in thoughtful minds, can our large cities be honestly and economically governed, and whether their moral and political condition is not growing worse with each passing year. New York, Chicago, Philadelphia and San Francisco have recently furnished us some conspicuous examples, and even smaller cities are falling into their wake. They are gradually reaching a state of demoralization in all parts of the Government, even to the management of school boards and sanitation, that is truly deplorable, if not alarming. It would seem that when a city arrives at a certain period of existence that it is given over as a prey and foraging ground to politicians. The substantial, the thrifty and industrious appear to be engrossed in business or indifferent to local Government as almost to entirely neglect their public duties. They pay their annual taxes with a growl, especially if they are a little higher than usual, but always with the apparent sense that the exaction is unavoidable and with no well-defined idea that they are to any extent responsible for the continuance of this state of things, or if they do rally for a general cleaning up, it is but a spasm of indignant feeling that soon spends its force.

In most large cities the tendency is to leave the management of municipal affairs to a class who live on public patronage or who are the besotted followers of local bosses and rings or so far under the dominion of partisan prejudice and traditional names that the smart politicians have everything pretty much their own way. Every municipality employs a large number of men to fill the various offices, and the parceling out of these places is treated as the property or patronage of the chief bosses. For each place or appointment there is one innumerable and b'fy more anxious to be. The result is the mastering of an utterly servile and unscrupulous army of followers who rule the clubs and other organizations. They control the primaries and do the howling and striking. They distribute the bribes and herd the voters. Above these, and in the back room of some fashionable saloon, may be found the big bosses who are the minions and janitors of the gas companies, water companies and other dragons that combine to fleece the people and loot the public treasury.

The Tweed exposure some years ago in New York showed what a vast and hungry vampire would fasten upon a local body and thrive upon the blood of the tax-payers. The trial of the Chicago bondholders is a later exposure. Then Cincinnati, St. Louis and Philadelphia had a struggle with the anacrona. San Francisco is a young city full of lusty life and energy, but has not been slow to learn the vicious political methods of the older cities of the East. It is a question we are called upon seriously to consider whether the people rule or the clubs and cliques. Are they allowed to assume any fair expression of their will and opinions in city affairs? Have they any voice in fixing water rates, gas rates, sanitation and the like, or are they the victims of King Booodle and his cronies?

This is a question that has almost passed out of the power of many American cities to remedy. The greedy cupidity of the ruling classes increases faster than the growth of material wealth or taxable basis, and consequently deficits increase. And thus it may be seen that the tendency of municipal governments is to depart further and further from frugal and strict, honest economy. Now where this will lead to is a matter of the gravest concern. If we had only one example of a city reforming and staying reformed, there might be some ground of hope. Exposures are almost daily made by a vigilant press, and indignation meetings are held, and all evaporates in talk and paper resolutions. City charters are amended, a new distribution of power takes place, and the old story of corruption and mismanagement goes on.

It is just now a question that is attracting considerable attention how far our municipal scandals may be abated by placing certain public interests, such, for instance, as the water supply and gas, under public control. The experiment is certainly worthy of trial in the interest of economy, and that there would be a large abatement of corruption must certainly follow. That the vast accumulation of wealth in the hands of private corporations has tended to poison and demoralize municipal politics, is almost an every-day fact. It is very easy and profitable to manipulate municipal councils and Boards of Supervisors. The forces of the dragon are, or may be, concentrated into a mighty battery at one point, while the people are scattered like sheep without a shepherd, and the mischief is often done and legalized before they are aware of their danger. With the municipal ownership of these plants, at least one incentive to bribery and tampering with the honor of public officials would be taken away. The scheme has worked well wherever it has been fairly tried, and if all the friends of just government, of economy and a better service of the people would unite and move in a solid phalanx, the measure would be accomplished.

The importations of ores from Sonora, Mexico, at Nogales, Arizona, during the month of February were 751,000 pounds, valued at \$87,375; lead ores, 147,484 pounds; copper, 11,980; gold bullion, \$24,792; silver bullion, \$17,390.

Mining of Asbestos.

Some interesting information regarding the mining of asbestos in Canada was recently given in an article in the *Popular Science Monthly* by Prof. J. T. Donald. Mining, he states, is carried on by cutting down the hills of asbestos-bearing serpentine, much as a farmer cuts down a stack of hay or straw, or by open quarrying on the level. The rock is blasted out, and the asbestos, separated from the containing rock, is "cobbed"—i. e., separated by hammering from adhering foreign matter. This cobbing is a comparatively easy matter in the case of the finer quality, as it usually separates readily from the gangue, but in the lower grades much difficulty is experienced in separating the fibrous matter from the non-fibrous. At best there is great waste. Much of the asbestos is in thin or narrow veins, and is wasted, as by the present mode of operating, it does not pay to separate this from the serpentine. A machine that will enable these narrow veins to be utilized is a desideratum.

When "cobbed" the asbestos is graded according to purity, color, and length of fiber, into three grades, and bagged for shipment. The finest quality or "firsts" finds ready sale at prices ranging from \$80 to \$110 per ton. "Seconds" fetch from \$50 to \$70 per ton, while "thirds" may be valued at \$13 to \$15 per ton. In good mines the yield of asbestos is from three to five per cent of the rock quarried, and the cost of mining may be put down at \$25 to \$30 per ton. Returns obtained by the Geological Survey of Canada show that for the year 1888 Canada's output was 4404 tons, valued at the mines at \$255,000, and this the output of nine different mines. Over three-fourths of the whole was shipped to the United States, small quantities going to Great Britain, Germany, France, Belgium and Italy, and being used in domestic manufacturing.

Wide Tires.

We have seen miles of road made useless of the winter by some man who would put a big load on a wagon and hitch a large number of animals to it and "go through." The law should subject all such persons to a fine in double the cost of the road. In some of the States, the wide-tire law is in operation with most beneficial results. It might work some hardship for a time, but it might be put in gradual operation for a time in summer. In winter, no man should be allowed to spoil a road. Heavy hauling should not be done when the ground is soft. Some men would recklessly tear up ten miles of road that cost \$1000 a mile for the sake of hauling a couple of cords of wood over it.—*Columbia Sun*.

Here we have concisely stated one of the prime reasons why our roads are chopped up and in many instances rendered totally unfit for use and we think it time for some attention to be paid to a subject of such moment, which concerns everybody. Wide tires would be a partial relief, but it would be better to prohibit the heavy vehicle from going over a road when it is probable it will tear it up.—*Vacaville Reporter*.

THEY DID NOT PAY.—The Nevada *Herald* tells us of the experiment that some genius is making on the cemented gravel of the mines of Little York Township with gas in order to decompose the cement to make it more readily yield the gold which it is thought to contain. The experiment spoken of is not likely to produce any satisfactory results, as the cemented gravel was well tested years ago by stamp-mills, and all the companies had to abandon their efforts. At one time there were 16 stamp-mills in Little York Township for the crushing of cemented gravel, which they successfully accomplished, but there was not sufficient gold in the gravel to compensate the expense. The only profitable gravel mining in that district was by the hydraulic process, and when that was stopped by the injunctions of the courts the mines had to stop, and since that time there has been little mining over there except the cleaning up of bedrock and ground sluicing in the ravines. Near You Bet there is one piece of ground, the Brown claim, that pays for drifting, and it is the only one in that vicinity that is being worked by that plan that now pays its way. The decomposing of the cement by gas is not going to restore mining in Little York to its former prosperous condition. These mines to be made productive must return to the hydraulic process.

A SULPHURIC ETHER MOTOR.—M. de Susini, a Corsican doctor, has, it is asserted, constructed a motive apparatus or propeller of 20-horse power, which is worked by sulphuric ether, a result which the doctor anticipates will realize a saving of 65 per cent of the combustible material at present employed for setting machinery in motion.

STAMP-COLLECTORS.—The magnitude of stamp-collectors' operations may be judged from a statement that a gentleman lives in Baden Baden who refused an offer of \$1,250,000 for his collection of postage-stamps.

HYDRAULIC POWER at a pressure of 750 pounds to the square inch is now being conveyed about beneath the streets of London as steam is conveyed in this country.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ZEILE.—*Ledger*, March 8: The water has again increased in this mine, necessitating the hoisting of water for nearly 24 hours each day. This prevents hoisting rock from the main shaft, and consequently 20 stamps of the mill are hung up until the water diminishes. A large number of the employees are laid off temporarily.

AMADOR GOLD MINE.—There is very little change to report at this mine. Supt. Darling has arrived, but no resumption of underground work has resulted as yet. The miners have not been paid their wages. They held a meeting in Pioneer hall Tuesday, to determine what should be done. Three weeks have elapsed since they quit work, and the law provides that miners' liens must be filed within 30 days after the last day's labor upon the property against which the lien attaches, or the lien is void. The miners are determined not to lose any of their rights. The agent of the company was waited upon to ascertain when they might look for the money. We understand they were told that the money would be forthcoming next Monday. The men decided to wait until then before proceeding to secure themselves by filing liens. It is said that when the mine starts again there will not be so many men employed as heretofore, at least not until the mill is ready.

SUTTER CREEK.—*Cor. Ledger*, March 8: Since my last another important transfer of mining property has taken place in this locality. The Summit mine, adjoining the famous Eureka on the south, has passed under the control of Eastern capitalists. This is gratifying news indeed, as Mr. Steward, who had the property hooded, had so much other mining business on hand that he was not in a position to operate it. The property is regarded as one of great promise, and it is hoped that it will respond to the expenditure of a little capital by developing into one of the best paying mines on the belt. The promoters of the South Eureka are only waiting for a settlement of the weather to commence operations in earnest. The new rope for North Star has not arrived yet. In the meantime they are doing some prospecting at the 800-foot level, to satisfy themselves, if possible, of the advisability of going deeper. J. H. Tibbits is expected up from the city, where he has been to make the necessary arrangements to do considerable work on the Sutter mine this summer. The sulphurets works, after a shut down of several weeks for want of acids and other material, have resumed operations, and evidently for a long run.

El Dorado.

ESPERANZA.—*Georgetown Gazette*, March 6: During the winter the work of sinking on the Esperanza, near Garden Valley, under Superintendent George Weist, has been prosecuted with the utmost diligence. We hear that the large ledge is improving in quality with depth. In conversing with a practical miner of that district, in no way connected with the mine, he expresses the opinion that the Esperanza will prove to be the most valuable mine in the county. We are glad to hear that this mine is more than holding its own as work of development progresses, for the building of a 20 or 40-stamp mill will be insured this summer. Mr. Burlingham has stayed with this mine for many years, through many trying pullbacks, confident that he had a valuable mine. He has great confidence in the old St. Lawrence mine. Over eight years ago he told us that before ten years have gone he felt confident that 200 stamps would be pounding out bullion in the vicinity of Garden Valley.

GRIZZLY FLAT.—*Cor. Mountain Democrat*, March 8: The Codlin Brothers at the crossing of Steely Fork, are putting up a 5-stamp mill, and as soon as the weather will permit, expect to commence crushing. Francis Delaney is running on the Treat mine and they have just struck the formation, a large body of porphyry and quartz. The tunnel is now in 200 feet. J. Lyons & Co. have made a very good cleanup on the Morey, and are going ahead with vigor. The Mt. Pleasant, under the superintendence of Capt. Smith, is still working to strike pay rock.

Calaveras.

CENTRAL HILL MINES AND OTHERS.—*Calaveras Chronicle*, March 8: The Central Hill mines, located six miles below this place, are turning out very handsomely; and in the neighborhood of Spring Valley, ground has been discovered which promises to be remunerative. At Central Hill the showing is especially flattering. Our special reporter gives us the following account of mining operations: The Union Shaft Gravel mine has proved itself to be one of the finest mines in the State, employing 16 men in and around the mine and several wood-choppers. The mine is run by steam. A washing of the gravel is made every 8 or 10 days. The last washing of last month produced 72½ oz. equal to \$4500 per month. The exposures are about \$1500, which is a very good showing for a mine that has lain idle for 15 years for the want of a little capital. There are some of the knowing ones around that feel like kicking themselves for not taking hold of it when they had a good opportunity. Adjoining the Union Shaft mine on the south is the old Swenson mine, owned by James Duryea, a valuable property waiting for a buyer. On the west of the Union is the Monier mine, a property of 80 acres containing the same lead as the Union and one of the easiest mines to open and operate in this section. The next west of this is the Benson mine, a splendid property. They have a three-stamp mill that crushes about 30 tons in 24 hours, and the dirt will yield from \$6 to \$8 per ton. The mine is worked through a tunnel of about 400 feet with about 60 feet of an incline at the end. The water is taken out with a syphon. They have a fine body of pay dirt to sight and employ about 16 men in and around the mill and mine. No timbering is required in the mine. The expenses are about \$1000 a month, which leaves a fine large margin for pluck and energy. About half a mile north of the Benson mine is the old Mullen mine, owned by Dave Cassinelli, and is at present being opened by a tunnel. This claim is known to have some very rich ground in it that could not be taken out by the old working as they were running down the channel and could not handle the water. Just west and adjoining the Benson mine is a mining prop-

erty of 200 acres on the old blue lead, and it is the only claim that can be worked and drained through a tunnel in this section. There is a fine opportunity for a little capital to develop a valuable property on the Ross ranch, near the old Spring Valley mine. A company has started in and piped off the surface and laid bare a fine large body of gold-bearing cement that prospects rich. It is too hard for the pipe, but the company intend to prospect the same thoroughly, and if it should prove to be extensive, they will erect machinery to work it. The next in order is the Michigan mine situated on the old Schockton ranch. It is a very peculiar deposit of gravel on the tops of the hills south of the road. It is from one to 20 feet thick and prospects from top to bottom. Mr. S. K. Snodgrass has about completed a new machine that is expected to work a hundred tons per day. They expect to have it running by the last of this week.

THE BRUNNER MINE.—*Mountain Echo*, March 6: Among the valuable mines in this section that are idle for the want of capital to work them, none strikes us as more valuable than the Brunner mine near Albany Flat. Some two years ago this claim was bonded by a company from San Francisco. This company sunk a shaft over 100 feet, but the water came in so rapidly that they were compelled to discontinue work. From the surface down to a depth of nearly 90 feet, the vein is fully 50 feet in width, and it is a well-known fact that this immense body of ore, by the ordinary process of milling, will yield from \$3 to \$4 per ton, and yet this mine is not made to yield up its golden treasure.

Inyo.

CERRO GORDO.—*Inyo Independent*, March 7: At last report the Union shaft at Cerro Gordo was timbered down to a depth of 600 feet. It is said that no timbering will be done below that point at present, but that miners will be put to work prospecting for ore on the 600 foot level. Up to this time the present owners of the Cerro Gordo mines have not done any prospecting, and all ore taken out since they took possession of the mines was by tributers. The company has already spent a good deal of money getting the mines in repair, and may have to spend much more before any profit is left.

BORAX.—The borax teams are again on the road hauling from Conn & Trudo's works in Saline valley to Alvord. The first trip after the recent storms two or three wagons broke down on the way, but the roads are now in good condition and there will be no more interruption from that cause.

SYLVANIA.—*Register*, March 6: It is much to be hoped the Big Piner will succeed in the move elsewhere mentioned, to open up a practicable and much shorter wagon road across the Inyos to Sylvania district. The big silver-lead mines of Sylvania mines have gone into new hands, and are to be extensively worked. These mines are believed to be capable of producing more silver-lead bullion, consequently freighting and other business, than is now done by all the rest of our mines combined. The cost of transportation to the railroad has been almost the sole obstacle all these years to the development of that very promising district, and, in short, that whole section. That obstacle still remains. This proposed road, if found as good as hoped for, will remove it.

SALINE VALLEY.—*Register*, March 6: A vast number of borax locations have been made in Saline valley—in fact the entire valley where the least trace of borax can be found is under claim, and many locations double claimed, from which some litigation is likely to arise. Conn & Trudo, with only one hoiler, two or three white men and four or five Indians doing the gathering and hauling of the crude material, are said to be making about a ton and a half of merchantable borax each day, which rate, we take it, beats the record a long ways. The present market price of this borax is \$180 per ton.

DOING WELL.—The Inyo M. Co., Otto Duenn to charge, now have about 230 tons of good free-milling gold ore on the dump of one of their mines situated about half a mile north of the old Casey mine, and with six men take out about ten tons a week on an average. The mine looks as if this output may be kept up for months to come. The mill will be started up in two or three weeks.

Nevada.

PROGRESS AT THE MENLO.—*Tidings*, March 7: Supt. Rawlough of the Menlo property expects to have the pump in operation two weeks hence. The Shaft (Homeward Bound) is 270 feet in depth and is filled with water to within 60 feet of the surface, while further down it is known there is a big cave. Considerable timbering will have to be done. The Homeward Bound machinery will be employed, the pumping machinery being placed on a new foundation, for which the excavation has been made. Thy hob-pit has been cleaned out and repaired and other improvements accomplished.

EMPIRE.—The caving of the Empire drain tunnel Wednesday night resulted in forcing a large quantity of water into the shaft. Thursday night tunnel was cleared, but another cave followed. We understand, however, that this, too, has been disposed of. There are some 400 feet of water in the mine. The North Banner will start up Monday with a full crew. It was necessary to divert two-thirds of the water from the Cascade ditch Thursday night to save it from being washed away. A break is reported, but it will not interfere with the supply of water.

PEABODY.—*Grass Valley Union*, March 12: The work of pumping out the Peabody mine will be commenced next Monday, as the season of severe storms is now considered to be over, and water power to run the machinery is not likely to be again interrupted.

A FORTUNE AT STAKE.—*Grass Valley Tidings*, March 12: The suit of the Idaho company against the Maryland company has excited no little interest. It is now assumed by plaintiff that the true line of the lode is 400 feet north of the line heretofore established. This has for twenty years been regarded as a parallel claim, upon which the companies have parallel locations. Should it be proved that the croppings are not those of a parallel lode, but the true course of the Eureka-Idaho lode and the boundary line fixed in accordance, the Idaho company will gain and the Maryland company lose 200 feet of ground, and it is said that from the appearance of the Idaho lower levels this ground is worth a fortune.

San Diego.

TO DEVELOP COAL.—*San Diego Union*, March 6: From time to time Southern California papers

have contained more or less authentic accounts of the discovery of coal deposits, but in spite of apparently authoritative declarations that this or that deposit is to be systematically developed, nothing definite has been accomplished and nearly all operations heretofore have been intermittent and unsatisfactory. It is the primary purpose of the exploring expedition of Colonel D. K. Allen, now on the Colorado Desert, to prospect for coal. Yesterday an old miner named Urgueta told a *Union* reporter that he had been commissioned by some New Mexico parties to make a careful inspection of the deposit of coal that is said to lie at the southeastern extremity of the San Jacinto mountain range. The New Mexican parties are said to have been connected with the mines at Gallup, N. M., and to have been convinced of the value of the deposit near the San Jacinto mountains through a report that was conveyed to them of the region by a miner formerly employed by them. Mr. Howard, for a long time interested in large New Mexican and Arizona properties and later in San Diego, is said to be one of the parties who have in view the possible development of the San Jacinto deposit. The project, if carried out, contemplates the building of a short spur road southward from the Southern Pacific. The *Union* does not positively know whether the project will be carried out, but it knows that the parties are, or not many months ago were, amply able to put such a plan into successful operation.

Siskiyou.

SALMON RIVER.—*Cor. Yreka Journal*: The damage by high water has been considerable. Every flume taking water from the river in this vicinity has been diverted of 30 to 40 joints, and some lose more, but the sawmills will soon be in operation to furnish lumber to repair damages as soon as the snow disappears and danger of more flood is over. Very little work is now being performed in the mines, in consequence of unfavorable opportunity on account of deep snow, but the quartz miners will soon commence operations with good prospects, including the Black Bear.

GRAVEL AND QUARTZ.—*Yreka Journal*, March 7: The Portuguese companies, now engaged in cleaning out and repairing the Big Ditch, have completed the work from Forest House as far as Greenhorn, the cold weather of past three or four days retarding their progress, in consequence of freezing the ground to make tough digging. The weather being now warmer, they will rush the work along rapidly, and may be able to start the water through it in 10 days more, so as to commence mining on the Yreka Flats and at Hawkinsville. The Klamath river miners do not expect to put in their windmills this season as early as usual, as the great amount of snow to be melted yet will keep the river very high for a long time. The freshets, however, have cleaned out the river of an immense amount of tailings toward affording a better opportunity of getting down to the pay channels much easier than before. The hydraulic miners in different parts of the county are fixing up their ditches and mining apparatus for a long and prosperous season, in addition to which they will have an abundance of water in some localities to carry on ground sluicing in working off the surface ground above, the richest pay gravel lying closest to bedrock. The cold weather of last week caused the water supply to freeze up in the sluices and smallest streams, but these cool spells occasionally are no great detriment, as the snow and ice will thus remain longer to lengthen out the season for good working. When we have continued rains and warm weather, the snow fields go off too fast, and the water is wasted to a great extent. Myron Carrick and Archie Nichols, who have been working a placer mine at the head of Spring Gulch, on Yreka Flats, lately discovered a stringer of quartz containing gold visible to the naked eye, and are now following it into the Humbung mountain, believing it will show up a permanent ledge or very rich pocket. The Black Jack M. Co., now working the upper end of the Blue Lead, above Jilison & Co.'s claim, west of Henley, are making preparations to prosecute work on an extensive scale during the coming summer. They have sunk down about 75 feet and find very rich gravel, and on reaching bedrock, will run a tunnel from outside of hill for drainage and working of claim in a more systematic manner. They have a new steam engine at Sacramento, to be shipped as soon as trains haul freight, which can be of good service in working the pump and hoisting. When the claim is fully opened for work, they will put up a quartz mill to crush the blue claylike gravel, running the gravel from both sides of the batteries into sluices, as the water has no effect on the gravel to dissolve it.

MINERS BUSY.—*Yreka Journal*, March 12: We hear good reports from the dry diggings and mountain gulches, where the miners are all busy while water is plenty, in securing gold dust, this being the only good season for them during the past 9 or 10 years. As there is considerable snow on the mountains to last some time yet, they will be able to continue operations almost until midsummer, while those on the low flats will have water enough to supply sluices nearly all summer. Ground sluicing and hydraulic mining is now being carried on with the greatest energy in many localities, by having an abundance of water to work off the top dirt, leaving the rich bedrock strata to be run into the sluices when the water supply becomes lighter. By having a flood of water for the deadwork required, a great saving of expense is acquired in getting at the good paying ground, which is usually found nearest the bedrock. The miners on Little Humbung expect to do big work in mining during the coming spring and summer, having been unable to carry on mining for two years past on account of scarcity of water. The Klamath river miners will probably not be able to commence putting in windmills and machinery until late, owing the river being high, with prospects of continuing so until middle of June, in consequence of the great amount of snow still remaining in the mountain regions of its extensive watershed. The Warren quartz-mill on Yreka Flats will be started up again, as soon as the weather becomes settled and the roads fixed up for hauling. The road to Greenhorn is badly washed out, and needs rebuilding to permit hauling from the ledges in that section, and the roads leading to other ledges, also need considerable repairing. Myron Carrick and Archie Nichols have struck a rich quartz ledge in their placer claim at head of Spring Gulch, on Yreka Flats, a specimen of the quartz shown us by Carrick containing a great amount of gold visible to the naked eye. They have only just tapped

it and expect it will widen out to a first-class and permanent ledge. The Humbung range on west side of Yreka undoubtedly contains very rich quartz ledges, which are evidently feeders of the rich pioneer diggings on Yreka Flats that paid so big in the '50 period, and have been worked over to paying advantage since.

Trinity.

DAMS.—*Trinity Journal*, March 8: The high water in East Weaver creek during the past few days endangered the mining claim of Hupp & McMurry to such an extent that they have been putting in dams to prevent the water from breaking in and filling up the ditch and covering up things generally.

Tuloume.

ORE-ROASTER.—*Independent*, March 8: Mr. J. R. Moffit has been in San Francisco since the first of February getting out the machinery for his new invention, the Oxygeo Ore-Roaster, which is expected to revolutionize the process of working rebellious ores. He expects to return home by the middle of this month, when his machine will be completed. This is Mr. Moffit's own invention, and is all covered by patents. During the past year he has constructed a small one at the mine, which proved a success, and the new one now being finished, is of a larger size, but will be portable. A rock-breaker works in connection with it and acts as a feeder also. The principle is that of a complete roaster in granular form of all ores under a great air-pressure in a confined chamber burning oxygen. The machine is automatic in its operation, feeding and discharging continuously. Mr. Moffit will have his roaster in operation within two months, when the owners of refractory ores will be invited to send in their rock for trial, and at the same time inspect the operation of this compact and economical ore-roaster.

TIMELY ASSISTANCE.—*Union-Democrat*, March 8: Last Monday night James Gerlach and Thomas Jones came near losing their lives in the Boazana mine. They went down the shaft too quickly after a shot of giant powder, and Gerlach was overcome by the fumes. Jones had strength enough to call and attract the attention of Engineer Moody, who then discovered that the lights of the shaft were out. He at once descended the shaft and managed to get the men on the skip and to the surface. Gerlach was entirely unconscious and Jones not much better. It was a narrow escape from what would have been certain death but for Mr. Moody's exertions.

NEVADA.

Washoe District.

ALTA.—*Virginia Enterprise*, March 8: Crushing about 45 tons of ore daily, and ore reserves looking about the same as last report.

IMPERIAL.—West crosscut No. 1, from the 750 level of the Imperial, is out 245 feet, 27 feet being added during the week; face in low-grade quartz. West crosscut No. 2, from the north drift on the same level, is out 70 feet, 50 feet having been added during the week. The face shows quartz and porphyry. West crosscut No. 2, from the 500 level north drift, is being repaired.

CONFIDENCE-CHALLENGE.—The joint Confidence-Challenge west crosscut, from the 300 level north-drift, is out 206 feet, 17 feet having been added during the week; face in a mixture of quartz and porphyry.

YELLOW JACKET.—Shipping about 65 tons of ore daily to the Brunswick mill. Usual prospecting work reported.

BELCHER.—The 200 level west crosscut, opposite the shaft, has been extended a total length of 479 feet, and stopped in the footwall. Will commence drifting in the ledge as soon as the ground is secured.

SEG. BELCHER.—The east crosscut, 100 level, has been advanced 37 feet during the week; total length, 305 feet; face in porphyry with small stringers of quartz running through it.

CROWN POINT.—The north drift, 160 level, is out 66 feet. The face shows a streak of ore 10 inches wide of good grade. The various stopes are looking and yielding about as usual. Shipped to the mill during the week, 664 tons of ore; average battery value, \$6.63 per ton.

JUSTICE.—The 622 level north drift advanced 21 feet; total length, 705 feet. The stopes on the 490 level are looking well and yielding the usual amount of ore. Shipped to the mill during the week, 198 tons of ore; average battery assays, \$28.03.

CHOLLAR.—The raise 300 feet north of south line, 650 level, is up 58 feet, roof in quartz giving low assays. The east crosscut, 80 feet south of north line, 750 level, is out 25 feet; face in clay and porphyry. East crosscut, 185 feet south of north line, 750 level, is out 5 feet; face in hard porphyry. East crosscut, 80 feet south of north line, 850 level, is out 25 feet; face in porphyry. The north lateral drift, 930 level, is out 515 feet; face in clay and porphyry. Owio to the waterpipe break, no ore was shipped to the mill the past week.

POTOSI.—The east crosscut, 400 feet south of north line, 850 level, is out 20 feet; face in porphyry. The raise 400 feet south of the shaft, 930 level, is up 41 feet; roof in quartz assaying \$30 a ton.

SILVER HILL.—The 260 level northeast crosscut in the southwest drift, 430 feet from the shaft, advanced 20 feet through hard porphyry; distance from the shaft, 600 feet. On the 160 level are repairing the northwest and southwest drifts.

EXCHEQUER.—The east crosscut on the north line is out 128 feet; face in hard porphyry.

ALPHA.—West crosscut, 100 feet north of shaft, 500 level, is out 485 feet; face in porphyry. North lateral drift, 600 level, is out 155 feet; face in quartz and porphyry.

SAVAGE.—On the 300 level the south lateral drift was advanced 35 feet, making its total distance from the main west drift 65 feet. The north lateral drift is advanced 18 feet. On the 400 level they are stoping ore of fair grade north and south from the top of No. 1 raise. Are extracting ore from the 400, 500, 600 and intermediate levels. During the week milled 375 tons of ore; average battery assays, \$22 per ton. Bullion on hand and previously shipped amounts to \$27,445.

HALE & NORCROSS.—The usual work was interrupted on account of an accident to the water company's flume during the week, and only about half the usual force of men was employed. Have extracted ore from the 400, 500, 600 and 1200 levels and milled 569 tons; average battery assay, \$18.43

On the 1150 level a prospecting drift has been advanced 30 feet. From the north drift, 1250 level, a prospecting drift was advanced 25 feet.

SCURMON.—On the 130 level are making good progress cutting out a shaft station.

BEST AND BELCHER.—On the 1000 level, east crosscut No. 1 is extended 215 feet. Formation, hard porphyry. On the 1200 level the north drift has been cleaned out and repaired 40 feet; total distance, 375 feet.

GOULD AND CURRY.—On the 200 level from the southwest drift, at a point 335 feet from west crosscut No. 1, west crosscut No. 2 is advanced 52 feet. Formation, hard porphyry, with streaks of quartz. On the 400 level all work for the past week has been confined to repairs.

Pioche District.

RICH STRIKE.—Pioche *Record*, March 1: A rich strike was made last week in the Last Chance No. 1 mine owned by Henry Welland and John Anderson, situated in Highland district, and under lease now to Alma Green and two other men. The ore is very rich and assays from 500 oz. to 2000 oz. in silver. They have uncovered the ledge for about 10 feet and it is all ore and from 10 to 14 inches in width. There are some four or five tons of ore uncovered, and from the formation and indications they think the ore will continue with the ledge and depth. Two weeks more work will tell whether they have a veritable bonanza or not.

Tuscarora District.

NAVAJO.—No. 3 crosscut from south drift, 150 foot level, extended 22 feet. No. 2 crosscut from south drift, 350 foot level, extended 22 feet; face is getting harder.

BELLE ISLE.—The crosscut from 250 foot level extended 22 feet, face looking favorable. Crosscut from 350 foot level extended 11 feet, cutting a large vein giving low assays.

NEVADA QUEEN.—North gangway, from 600 foot level station, has been advanced 26 feet. Gangway is being run on footwall side of the ore, so as to make headway in getting to the line.

GRAND PRIZE.—400 foot level: North crosscut from west drift extended 8 feet. 500 foot level: East drift from north crosscut extended 11 feet, and showing a two foot vein of concentrating and milling ore.

NORTH BELLE ISLE.—South drift from station crosscut, 300 foot level, extended 7 feet. The stopes above the 300 foot level are without material change. North gangway from the shaft, 600 foot level, advanced 26 feet in the footwall rock and parallel to the ledge, thus making better progress and avoiding timbering. The ore where broken is found to be of high grade.

DEL MONTE.—1st level: North drift from No. 2, crosscut has been advanced 14 feet. The ore has raised up over the drift. North drift from joint crosscut has been extended 10 feet and continues to expose high grade ore.

NORTH COMMONWEALTH.—1st level: South drift from joint crosscut has been advanced 13 feet, developing 3 feet of rich ore, and improving as drift is advanced. Have started No. 2 north drift to open up ore cut by No. 1 crosscut, in seven feet, showing some good ore. North intermediate drift from No. 1 upraise extended 7 feet. North face of drift is all in ore, very high grade, assay from \$200 to \$800 per ton. South face is all ore but not so good average, but shows high grade mixed through the face. 2d level: Joint crosscut east extended 20 feet. A joint crosscut with Commonwealth will be started the 10th. This crosscut will open up the ground adjoining the Commonwealth on the south line of the claim.

COMMONWEALTH.—1st level: East drift from No. 1 north drift extended 16 feet, following the ore, which is developing well. North drift from No. 5 chute extended 17 feet, and is within 8 feet of North Commonwealth line. As soon as it reaches the line a joint crosscut will be started to open up all this north end. The 1st, 2d and 3d level stopes are yielding usual quantity of ore; 979 cars of ore hoisted and sent to the mill and concentrator. Average battery assay at mill, \$251 36 per ton; average assay at concentrator, \$18 32 per ton. Ship to-day \$18,000; total for week, \$35,021 91. Mill is running and doing good work.

Tybo District.

GOOD MINES.—Belmont *Courier*, March 6: There are other mines in Tybo district, Nye county, besides the 2-G and the Dimick which are known to be valuable properties, and which, in the course of time, will make a stir in mining circles. Judge George Turin, the Gilmore Brothers, L. B. Fairbank and others are owners of good mines, situated in that district. As soon as Congress remonetizes silver, these properties will be developed in a thorough and systematic manner, and they will undoubtedly yield immense quantities of rich ore. The people of Tybo will enjoy lively times again.

DAKOTA.

BEAR GULCH.—Spearfish *Reporter*, March 4: Few even of the well-informed persons of the Hills, on mining matters, are aware of the wealth of resources in a mining point of view, embraced in Rawlins mining district, more commonly spoken of as Bear Gulch district. One of the richest placer districts in the early days, it is one of the very few in the Black Hills where placer mining has been successfully carried on from 1876 to the present day. Practically all of three-fifths of the vast amount of work done on the hundreds of tin claims in the district has been paid for with the precious dust taken from its gulches in the most primitive manner, the supply of water rarely being sufficient for sluicing except with the aid of reservoirs of small capacity. Many, even among old-timers, are not aware that there are extensive ledges of gold ore scattered throughout the district, many of them free milling, and assaying from \$3 to \$7 per ton, or relatively richer than the ores worked to a good profit by the Homestake Co., but such is a fact, nevertheless. The Bear Gulch gold ledges, traceable for miles, are lying neglected for lack of milling facilities, awaiting the time when cheaper transportation and the advent of outside capital with large mills can render them paying properties. Refractory gold ores are also known to exist in vast quantities within the limits of the district, in a belt extending from Iron creek westward some five or six miles to Mallory gulch, on the Wyoming side, and so far as superficially prospected, running north from Beartown some four miles, and south six or seven miles to and beyond Cement hill. Sil-

ver ore in almost all its known varieties is known to exist in nearly all parts of the district, yet, strange to say, little prospecting has been done for it. The tin belt covers a known area of over 30 square miles, the rich ore in many places being exposed with great wide faces, where it can be quarried for years. The great abundance and rare richness of these tin deposits has overshadowed the presence of the more precious metals, and caused the neglect of prospecting for them, the miners deeming that tin property would meet with more ready sale, and that, with the money realized from their tin claims they could better develop the others, and keeping to themselves, as far as possible, their knowledge of the latter. Prof. Chase, now located at Redfield, South Dakota, while he was superintendent of the Cleveland Tin Co. in 1886 and 1887, took a great interest in the mineralogy of the country, unhesitatingly pronounced Bear Gulch the most wonderful mineral district he had ever been in, its metals covering a larger range and occurring in large bodies, giving it a wealth of mineral resources rarely met with in the same area.

ARIZONA.

THE BUFFALO MINE.—Globe *Silver Bell*, March 6: Dr. A. Trippel arrived on Wednesday evening, on business connected with the Buffalo copper mine. From him we learn that the intention of the owners of that property is to prospect the mine, and if developments justify it, enlarge operations and begin smelting. Work in the mine is to commence at once with a force of 10 or 12 men. Persons best qualified to express an opinion believe that the Buffalo is one of the very best copper properties in Globe district, or for that matter, in Arizona, and in time, under wise management, will become a steady producer. Dr. Trippel's attention, for the next few months at least, will be chiefly occupied in directing operations at the Arivaipa mines, four miles north of Dunlap, Graham county, recently purchased by Mr. Goddard of New York, and to be operated by the Arivaipa M. Co. The claims, 32 in number, are considered promising prospects. The ores are argentiferous and the deposits very large. A great deal of preliminary work must be done, such as constructing roads, erecting buildings and providing the necessary equipment of machinery, tools, etc., before mining is actually begun, which, however, will not be later than a month hence. Dr. Trippel, after personal observation and from information obtained from well-posted mining men encountered in his travels, expresses the opinion that Globe is the most promising copper camp in Arizona.

COLORADO.

ST. KEVIN.—Leadville *Herald-Democrat*, March 6: The new shaft of the St. Kevin mine at Leadville is now down about 230 feet, and it is estimated that a further sinking of about 90 feet will bring them into the chute caught on the drifting at the bottom of the winze from the 400-foot level of the old workings. This chute is already proven to be a good one, and the connection once made between these workings and the new shaft will greatly facilitate the handling of the ore, and also tend to develop a comparatively new territory. The mill on this property, while running with only 10 stamps dropping, is handling about 40 tons of "mill dirt" per day, and is doing such good work that the concentrates are running higher than ever before. The other 10 stamps are not run at present, as the water supply from the gulch is rather precarious, and as it might freeze on them, the management prefer to be able to count upon a given supply than to take any chances. Several small stringers of ore have been met with in this shaft in the sinking, but as the purpose has been to sink this shaft to the old mineral contact, very little attention has been paid to them. Later, they may be followed and prospected, but at present the prevalent idea is to get down to the main vein and make the connections by which the shipment of ore from that point may be facilitated.

ANOTHER POTOSI STRIKE.—Supt. Carroll of the Potosi mine arrived in Denver yesterday morning. He had specimens of rich ore and a pleasant smile. On last Thursday the men at work on the property came into an ore streak that indicates no little richness. An assay was made which resulted in the gratifying report of \$40 to \$60 per ton on different pieces taken without special care, he says. The average of the ore is \$490 per ton. This is the second strike in this property in a month, and seems to indicate that the deeper the men go the better ore they get.

IDAHO.

FROM SMOKEY.—Wood River *Times*, March 5: N. E. Heckethorn is in from Smokey. He says the King of the West has yielded more than expenses all winter, but no strike has been made in the mine recently, and any announcement of ore is premature. The miners are, however, working to get under an ore chute—a point which they expect to make in about two weeks—when they will probably cut into ore. The property has excellent prospects of becoming a mine. Before leaving, Mr. Heckethorn heard a report to the effect that the leasers on the Carrie Leonard group had over 200 tons of ore out, with more in sight. He does not know on what claim this ore is but believes it is the Pot Wrestler.

THE IDAHOAN.—Statesman, March 5: Mr. A. J. MacGowan of Hailey reports the famous Idahoan mine in a very promising condition, eight feet of good ore having been found on the 800-foot level, which is evidently continuous with a similar ore vein on the 600-foot level, thus bringing virtually in sight a strong vein of 200 feet perpendicular and of unknown extent along the length of the claim. These developments fully warrant the management in claiming an ore body in sight, the value of which at the lowest estimate cannot be less than \$200,000. The town of Hailey is already feeling the impulse of this and other recent developments and discoveries in the increased confidence of business men and miners.

LOWER CALIFORNIA.

ALAMO.—The reason Mr. Kerr's Wiswell quartz mill did not arrive on the Newbern last month was because the roads from here to Alamo were in such poor condition that it could not then have been tak-

en to the mines, and Mr. Kerr purposely delayed its arrival. The roads are now in good order and the mill will be ready for work in Alamo by April 1st. The engine is 16x24 inches, of 60-horse-power, and is capable of running four Wiswell mills with a Gates rock-crusher attached. Mr. Kerr states that another Wiswell mill is to arrive on next month's Newbern and both mills will be erected on the Jeff. Davis claim in Alamo, just below the Company's mill on the same side of the creek. One mill will be used exclusively to crush ore from Mr. Kerr's three mines, the Asbestos, Jeff. Davis and Americana, and the other will be open to custom work. A Hinkle positive self-feeder will be attached to the rock-crusher. Concentrators will be attached to the mill, and patrons will get the full benefit of their ore. Mr. Kerr says he will make the price of milling within the reach of mine-owners with \$10 ore. J. M. Gonzales came in from Alamo on the Douglas stage last Monday. He has glowing reports of his mine, the Aurora. Thirty-nine tons of ore yielded \$13.80 per ton, and it was not a picked lot either. Ex-Gov. Geo. Ryerson has bought all of O. P. Reed's interest in the Reed, Wisconsin, Dora Mettel, Arabella and Hattie mines. The consideration was \$5000 in gold. Mr. Neal has bought a one-tenth interest in the Arabella, formerly owned by Mr. Hughes, for \$300. The Aurora is said to be the only mine in the camp that has paid expenses from the start.

MONTANA.

AROUND BOULDER.—Boulder *Age*, March 5: Eight bars of Holter bullion came down from Elkhorn the past week for shipment East. Two hundred and eighty-five quartz locations were made in Jefferson county during the month of January last. Sinking has been resumed on the Hoosier Boy, formerly the Grizzly, in the Bigfoot district. A car of ore from the 11th mine, in the Willow Springs district, and a car of ore from the Elkhorn Queen mine, near Elkhorn, are being loaded at the Northern Pacific depot for shipment to Helena. Messrs. Ham and Burrows have leased the Dunstone mine, at Elkhorn, for one year and have already begun shipping ore. The Bigfoot mine, in the Bigfoot district, a dozen miles south of Boulder, was sold by the Sheriff this week for \$1650, the Holter Hardware Co. of Helena being the purchaser. The Crescent mine, in the Upper Basin country, has been sold to Eastern parties, and immediate development will ensue. The outlook for the development of the many rich mines in the Upper Basin is very bright, and the prospectors who have been holding on to their properties in that section for 12 or 15 years, making such developments as their limited means would allow, feel much encouraged. The sale of the Elkhorn Mining Co.'s property at Elkhorn was completed last week, Messrs. A. M. Holter, M. M. Holter, C. L. Vawter, John Shober, and Mrs. Janet Kinna being paid \$532,000 and probably some stock in the new company in addition.

STRIKE IN THE MAY FLOWER.—It was reported in Helena last week by Mr. Davis of the Little Blackfoot region, that a good strike had been made on the May Flower lode, situated about eight miles south of Elliston. The shaft is down 100 feet and a level 110 feet in length has been run along the vein, which is ten feet between walls. The ore encountered is from eight inches to three feet in width and assays from 100 to 700 ounces to the ton.

THE MAGNOLIA CON.—The prospect of the Magnolia is now down 152 feet, and as the company is in good shape it will push the shaft to a depth of 200 feet and then crosscut. The capital has been raised outside of Deer Lodge, and economy has been used in its expenditure.

THE CHAMPION MILL.—New Northwest, March 7: The Champion Consolidated silver mill has been completed. On Wednesday last, at the hour of 5 o'clock, everything was in readiness to start the machinery. About 60 of our citizens had assembled at the mill to see it started on its mission of usefulness. At the proper moment, Gussie, the nine-year old daughter of Mr. N. J. Bielenberg, the president, touched the little wheel which starts the mill, and then all the vast machinery was set in motion. The mill is situated about one mile southeast of Deer Lodge. In a few days it will begin work for the company and be run to its full capacity. The Champion mill has a crusher 9x15, Blake pattern, 40-inch dryer, 20 stamps of 850 pounds each, 60-inch white Howell roaster, 8 pans, 4 settlers, and 1 clean-up pan. The power of the mill is furnished by a Westinghouse compound engine, of nominally 125-horse power. This is an entirely new departure in furnishing power for quartz mills, as the public has always considered that no complete mill could properly have anything other than some make of Corliss engine. The wisdom of the departure can be very readily seen, however, when the fact is stated that among all the engines that are made to-day, the Westinghouse compound engine stands on its actual guaranteed tests second to none in point of economy.

WICKES MINES.—Mining Review, March 5: The advent of spring weather has infused more life into the mining industry about Wickes than has prevailed for the past six months, and active development work is now being prosecuted on many of the "claims" in that locality. A large number of men are at work on the Gregory and Banner mines; the Sirius mine is undergoing extensive development. The Lightning mine, adjoining the well-known Copper Bell on the west, is keeping a small force employed in opening up a crosscut to strike the lead at a depth of 250 feet below the shaft, and many other properties are being worked or put in shape for next season's campaign.

THE CHAMPION.—Phillipsburg *Mail*, March 8: The engine and other machinery for the Champion mill, so long delayed, arrived last Saturday, and is now being placed, says the *Northwest*. Holders of Champion shares are elated, as they have assurance from the contractors that the mill will be completed and ready to start up by March 15th. The capacity of the mill is 30 tons per day, and if the ore averages as well as it has so far, the gross output will be from \$1200 to \$1500 per day. As briefly mentioned in these columns last week, the west drift has recently opened out a splendid body of high-grade ore that promises to rival anything heretofore discovered in the mine. The Champion's future is no longer a matter of speculation—it is one of assured prosperity.

ANACONDA.—Review, March 6: The mines of the rich section west of Anaconda all tend to produce base ore. Even the Southern Cross will be a

more profitable mine if its ore can be smelted, as was shown by the recent tests made at Butte and East Helena. The Anaconda smelter was constructed with a view to using it as a custom plant, and to these works the base ore from the Silver Lake, Flint Creek and Black Pine districts will naturally come. Bearing these facts in mind, it is evident what a tremendous power the Anaconda Company can exert in controlling the copper market. All estimates on the copper markets are made provisional to the amount of the red metal produced by the Anaconda. Since the fire in the mine, the copper market has been decidedly buoyant, and according to the Eastern estimates will remain so as long as the mine is not operated. From this it will be seen that the Anaconda practically controls the price of copper. Now, with large silver and lead producing country tributary to us and connected with the works by rail, the smelter could, in event of a sluggish copper market, be operated for silver and lead, and change the tendency of the market. With a capacity of 100,000,000 pounds of copper per year, the Anaconda works possess a great advantage over other copper-producing works, which, as soon as the Great Northern has rendered accessible the ores referred to, will result in untold benefit to the company and to our city.

NEW MEXICO.

THE RUSH TO THE MOGOLONS.—Southwest *Sentinel*, March 4: The rush in the Mogollon country has fairly set in, and the stages running between Silver City and Cooney are taxed to their utmost capacity to accommodate the number of speculators, prospectors and home-seekers desiring to reach the new mining camps on the Mogollon range. Freighters, too, are doing a lively business transporting stores and household goods to the new field of mining operations. Town-sites are being laid out and several fine business houses erected, while four or five new saloons already mark the sites of the prospective cities. A newspaper plant is about to follow, to publish to the world the wonderful mineral, ranch and agricultural possibilities of the little California. The bulk of the immigration to the new field is, so far, composed of the surplus population of the different localities in this and adjoining counties; yet that a steady immigration from the East will set in when the diligent advance guard settle down to business and their newspaper begins to tell of their great accomplishments, is easy enough to believe. The rapid growth and development of the new El Dorado means great things for this city, its chief outlet and supply depot, and the *Sentinel* can only hope that the fondest anticipations of the colonists will be fully realized and that the different camps of the Cooney and Silver Creek district will prove all that is claimed for them. The ore deposits are continuous, expansive and easily wrought, and the waste piles will not out-throw the shipping dumps as is the case in some of the mining districts.

CAVE CREEK.—Kingston *Shaft*, Mar. 8: Mr. Root came to town last Sunday feeling elated over his strike of high-grade ore on some mining properties in which he is interested on Cave Creek. James Stuck, foreman of the Eureka mine at Hillsborough, showed his pleasant countenance on our streets this week. He reports the mining outlook prosperous in that vicinity. Charley Fogarty was in town from the Carpenter district this week for supplies. We understand that Charley has a good thing across the range. He now has a large body of galena and lead carbonate ore exposed on a continuous lead for 600 feet; and one shaft, 35 feet deep, shows ore from top to bottom, and improving as it goes down.

HERMOSA.—The Hermosa district never looked so encouraging as at present. Nearly all of the leasers are doing excellently. The new "strike" on the lease of James Reed, McCrellis and Harkney on the Pelican Company's ground, bids fair to eclipse the St. Charles-Crigger lease of three years ago; and more remarkable for its depth of 125 feet below the shale contact. Beebe & Burk are still sacking the precious metal on their lease.

UTAH.

EUREKA.—Eureka *Chief*, March 7: Henry Kohl and Tim Kelly have for a number of years been at work on the King William group, on the summit of Eureka hill, and were rewarded this week by striking a foot of ore which goes over 100 ozs. in silver. There is no doubt that the vein will become larger and that the King William will add another to the long list of rich producers for which Tintic is becoming famous. On the 1000-foot level of the Mammoth a large body of ore was struck last week which is worth \$29 a pound. In other districts such a strike would set the people wild, but rich finds are so frequent that they cause no excitement here. It is rumored that a very rich body of native silver has been struck in the Bullion-Beck.

REVIEW.—Salt Lake *Tribune*, March 7: The receipts of bullion in this city for the two completed months of the present year, according to current bullion reports, excluding all ore, were as follows:

January.....	\$243,892 67
February.....	95,947 60

Total.....\$339,840 27

THE ONTARIO FOR TWO MONTHS.

January, bullion (ozs).....	87,751.2
January, ore sales.....	\$42,445 09
February, bullion (ozs).....	77,869.94
February, ore sales.....	\$59,898 32

THE DALY FOR TWO MONTHS.

January, ore sales (no bullion).....	\$15,610 23
February, ore sales.....	45,715 45

The week has been one of storms, cold and thaw, but the movements of the metals have been fair. There has been talk during the week of organizing a metal exchange, but no definite action has been taken. The receipts in this city for the week were to the value of \$136,776.62 in total, of which \$70,182.83 was in bullion and \$66,593.79 was in ore. For the previous week the receipts were \$126,673.75 in total, of which \$83,834.41 was in bullion and \$42,839.34 was in ore. The product of the Ontario for the week was in ore sales, \$10,160.29. The Hanauer smelter produced during the week bullion valued at \$650. Ore receipts in this city for the week were valued at \$30,559.68 by Wells, Fargo & Co., \$24,670 by McCormick & Co., and \$10,364.11 by T. R. Jones & Co.

MECHANICAL PROGRESS.

How Invention Has Revolutionized the Condition of Workingmen.

The progress of the age is shown as much in the advanced ideas now prevalent among workingmen as in any of the other signs of the times. Until quite recently the great hugeness of the unskilled workingmen has always been the displacement of hand labor by machine labor, which they argue throws so many men out of employment. The fact is too often overlooked that work is thus made very much less arduous, and statistics show that in the course of time the number of workmen employed is increased rather than diminished, and there is really no loss of employment.

In view of the antagonism shown against the adoption of machines in many branches of industry even up to quite a recent date, it is interesting to note the action of the coal miners of the Central States at their recent meeting at Columbus, Ohio. A resolution was passed at this meeting indorsing the Shaw machine and recommending its adoption in all the mines of the country. The use of coal-mining machinery is certainly very beneficial to those who are obliged to work in cramped positions when mining by hand. The coal-miners are very sensible to admit this, and their action proves them to be among the most progressive of workingmen.

We append a general summary of the extent to which invention has revolutionized the conditions of workingmen:

In the manufacture of boots and shoes, the work of 500 operatives is now done by 100.

In making bread-boxes, three workers can do the work of 13 box-makers by old methods. In cutting out clothing and cloth caps with dies, one worker does the work of three by old methods.

In leather manufacture, modern methods have reduced the necessary number of workers from 5 to 50 per cent.

A carpet measuring and brushing machine with one operator will do the work of 15 men by the old methods.

In the manufacture of flour, modern improvements save 75 per cent of the manual labor that once was necessary.

In making tin cans, one man and a boy with modern appliances can do the work of 10 workers by the old process.

By the use of coal-mining machines, 160 miners can mine as much coal in a month as 500 miners by the old methods.

One boy, by machinery in turning wood-work and materials for musical instruments, performs the work of 25 men by the old methods.

The horse-power of steam used in the United States on railways, steamers, and in factories and mines, was in 1888 12,100,000, against 1,610,000 in 1850.

In the manufacture of brick, improved devices save one-tenth of the labor, and in the manufacture of fire-brick 40 per cent of the manual labor is displaced.

Characteristics of Emery-Wheels.

Mr. T. Dunkin Paret, president of the American Tanite Company, recently gave a lecture before the Franklin Institute on the subject of "Emery-Wheels," from which we condense as follows:

The lecturer referred to the scarcity of literature on this subject, and then gave from his own literature and his own knowledge a brief historical sketch of the industry. It was claimed by a British authority that the solid emery-wheel was invented in 1842 by an Englishman, but this same authority admits that the Americans lead in the industry. He claims for both British and American wheels superiority over those made on the continent of Europe. Emery-wheels were broadly classed under three heads: Those made by some process of vitrification; those which are practically artificial stones; and those whose base is of vegetable or animal origin. In the first two classes were inherent defects, such as brittleness, hidden cracks and flaws, unequal tension, tendency to glaze or clog up with metal, and (in some) the tendency to deteriorate on exposure to the air. Preference was given to the third class, which could be divided into two sub-classes—those which were mechanical mixtures and those which were chemical compounds or organic substances. As examples of the latter he named the vulcanized oils and gums, metamorphosed woody fiber and tanbark. For all kinds of solid wheels the makers made strong claims, but as yet these claims had not been sustained or refuted by careful scientific investigation. Such investigation was needed in order that the comparative value of the different makes could be demonstrated, and also their value as compared with other tools and machines.

The industry was young, and it could not be expected to have the full development which characterized older ones. It was only now that the most experienced wheel-makers were ready to put their industry on a scientific basis, and now the users had lost all faith as to there being any science in the business, while they still felt that solid wheels were a necessity.

There were many mistaken demands upon the solid wheel. It was intended to grind and not to polish, and was not meant to supersede

all other metal-working processes. The solid wheel had its place on elaborate machines as a substitute for the steel tool usually employed there. It could be used on special machines to do more perfect work than the steel tool and to work on harder substances. It could be used on general machines as a competitor of the file, grindstone and cold-chisel. The solid emery-wheel was the great metal remover.

A mechanical professor had characterized the grinding room as a cast-iron slaughter-house. To do full work, wheels should be put on heavy machines and based on substantial foundations. The work must be in continuous contact with the wheel. Being so, the wheel became a rotary file which ran a mile in a minute and whose cutting points never grew dull. Unfortunately these necessary conditions were often not complied with, and only a fraction of the possible work was done. The visible results of a working wheel were very misleading. The greatest delusion was to make durability the standard of perfection in a solid wheel. While it was possible to have a wheel wear out too rapidly for economy, yet very few American wheels were too soft, the bulk being too hard, and their durability being more than balanced by the decrease in metal removal. These facts were illustrated by statistical tables.

A brief sketch was given of the abrading minerals generally used in solid wheels. General and special machines were described, a few typical uses were explained, the safety of wheels was discussed, some new uses were alluded to, and suggestions made as to the probable future development of the industry.

Various exhibits were made. One of these demonstrated that in equal time the wheel had cut 126 times as much as the file. This was on cast steel. In certain other trials the wheel had removed 21 times as much cast iron as the file and 34 times as much as brass.

The power needed to drive solid wheels was said to be much less than is usually supposed. The lecturer claimed that this new industry opened a wide and interesting field, as yet little explored, where both students and expert could do good work. He alluded to the greater fascinations held out by the problems in transit, in bridge-building, in electrical work, in metallurgy, and feared there might be some neglect to watch and improve the every-day practices of the factory, mill and shop. He held up the solid emery-wheel business as one example of the possibility of elaborating a great economy out of a small industry.

Economy in Manufacturing Bolts and Nuts.

It is claimed by Americans, even, that the English are ahead of us in both economy and rapidity in the matter of turning out track bolts, ship and bridge rivets. Manchester is the headquarters of the business and the process employed is noteworthy for economy, completeness and rapidity of production. The rivets are made from the scrap-heap at one heat, and finished for the trade as follows: The scrap iron is piled about one-half the usual size, and puddled in the customary manner; the molten ball of metal is passed through the squeezers, then through a train of six sets of continuous rolls, each pair feeding into the next and reducing the diameter correspondingly, and in order to insure a certainty of uniformity in size, it finally runs through a set of sizing rolls and then automatically conducted into a rivet-forming machine where adjustable cutters shear off the metal into proper length, reduce it to its proper shape, form the head, and finally drop the perfect rivet into an endless bucket-carrying chain, by which the rivets are carried to the packing-room.

One train of rolls feeds four machines, which turn out 16 tons of rivets in three shifts of eight hours each.

Track and bolt nuts are forged by the same process at the rate of 40 each minute. All are made from the billet at one heat. It should be remarked, however, that railroad spikes are made at Pittsburg, Pa., by the same class of machinery (which has not been although it might be applied to rivets, etc.), as in England. We condense the above from a communication to the *Western Manufacturer*, by W. R. Wilbur, a bolt and nut manufacturer, who attended the Paris Exposition, and who appears to have thoroughly informed himself in regard to his particular line of iron work.

Mr. Wilbur, while recognizing the superior class of machinery employed by the English in the forging of this line of goods, says that our mechanics are far ahead of our cousins in finishing and fitting up the same, whatever that may imply in regard to a machine that turns out the goods fully finished. He holds that our people are also ahead in tapping and threading, and are without certain modern improvements in that direction.

In closing his communication, Mr. Wilbur says: In this line of mechanics I believe that we Americans may learn much from close and intelligent study of the methods of our European co-workers. In the main we excel in rapidity and cheapness of production. Our inventive mechanical genius has been directed toward these latter elements, with a lesser consideration for the matter of quality, while on the other side quality has seemed to be ever the primal consideration and rapidity and cheapness rather incidental. Great mutual good must result from every well-improved opportunity for comparison of methods.

SCIENTIFIC PROGRESS.

Extermination of American Game.

Railroads and the "man with the gun" are proving too much for game, large and small; the first making easily accessible what, not long ago, was remote, almost trackless, wilderness and mountain fastness, and the breech-loading gun, especially the magazine type, enabling the veriest tyro to find his mark. The last link in that great chain of rails that has been uncovering the haunts of booted game is the new transcontinental line, the St. Paul, Minneapolis & Manitoba railway, invading, as it does, the last stronghold of the Rocky mountain goat, mountain sheep, elk, and woodland caribou. The wild country about St. Mary's lake, the Kootenai lands, too, is now thrown open to the sportsman, cattle-raiser, miner, lumberman and granger. Happily in the Yellowstone Park are collected some herds of the noble game once roaming the broad continent in countless thousands. What remains is in sad need of protection from the pelting hunter and the wretched slayer.

In a recent paper, W. T. Hornaday of the Smithsonian Institution computes the amount of game now remaining and discusses the prospects of its survival. He says the wildest trail of the old days is now across a fortnight's journey from Broadway, and the hunter who was formerly contented with a mere blunderbuss of a gun must now have a repeating rifle, by which he enters up the game with his first shot, and pumps lead after it, shot after shot, in rapid succession till he brings the animal down or sends it away with a mortal wound.

Then the Western farmer generally kills everything he sees, whether he needs it or not. Mr. Hornaday was once offered for a dollar each, 34 little spotted fawn-skins from the young of the mule deer, not one of which came from a fawn over three weeks old.

Practically speaking, the American bison in his wild state was not long since extinct. Eighteen years ago there were millions of them. The elk will be the next to go, being easy to kill. Once they spread over the United States, but are now found only in two or three localities in the Rocky mountains.

The prong-horned antelope, that picturesque creature, is scarcely good for ten years more outside the Yellowstone Park. He lives in the prairies, open plains or park-like meadows, and can be outwitted by the veriest bungler with a good gun.

Moose, since they range up to the arctic regions, cannot be wiped out, but in the United States they will scarcely last as 20 years, there remaining not probably less than 150 head.

The black-tail, or mule deer, will go long before his congener, the Virginia white-tail. The latter does his own thinking, being keen-eyed and alert, and skulking in the thickest timber, will not, in all likelihood, ever be driven even from the Eastern States. The Rocky mountain goat is as good as gone with us; all his haunts are known, and he is being slaughtered at wholesale. The mountain sheep, or big horn, is sharing the same fate.

The ancient Hudson Bay Fur Company is winding up its affairs, there being no more furs to be had, and an old fur-buyer, recently returned from the Northwest, says the business of gathering furs is dead. The beaver has become scarce, trappers now seeking the once-deep-seated muskrat and even the little gray rabbit to make up for the lack of beaver, otter, mink, marten and sable. The Southern fur seal is gone; the California elephant seal is extinct; the walrus is rare; the great arctic sea-cow is gone, its congener, the manatee, a curiosity. Bears, particularly the grizzly, wolves and foxes, are fast going, and milliners' taxidermists are now slaughtering the singing birds in vast quantities.

The Wonders of Human Mechanism.

The movements of the nerves and muscles in playing a piece of music are wonderful. A writer in *Popular Science Monthly* says he once heard Miss Janotta play a presto by Mendelssohn. She played 5595 notes in four minutes and three seconds. Each one of these notes involved certain movements of a finger, at least two, and many of them involved an additional movement laterally as well as those up and down. They also involved repeated movements of the wrists, elbows and arms, altogether not less than one movement for each time. Therefore there were three distinct movements for each note. As there were 24 notes per second, and each of these notes involved three distinct musical movements, that amounted to 72 movements in each second. Moreover, each of these notes was determined by the will to a chosen place, with a certain force at a certain time and with a certain duration; therefore there were four distinct qualities in each of the 72 movements in each second. Such were the transmissions outward, and all those were conditional on consciousness of the position of each hand and each finger before it was moved, and by moving it of the sound and the force of each touch; therefore there were three conscious sensations to every note.

There were 72 transmissions per second, 144 to and fro, and those with constant change of quality; and then, added to that, all the time the memory was remembering each note in its

due time and place, and was exercised in the comparison of it with others that came before; so that it would be fair to say that there were not less than 200 transmissions of nerve force to and from the brain outward and inward every second, and during the whole of that time judgment was being exercised as to whether the music was being played better or worse than before, and the mind was conscious of some of the motions which the music was intended to inspire.

DISCOVERY OF THE FOSSIL HORSE.—Prof. O. C. Marsh of Yale is still on the sunny side of 50, and a vigorous, pushing man. Mr. Marsh is probably the best known on the other side of the water of all our geologists. He received great honors from foreign societies and governments, a few years ago, on account of his discovery of the ancestry of the horse, bringing up his evolution from the lower order of animals to his present perfect state. His discovery came about in this wise: During vacation one summer he took a number of Yale students on a working frolic to "the bad lands," in Nebraska, which are regarded as the best for obtaining all sorts of fossils of any territory in the world. During this trip the professor and his party discovered a dried-up swamp that had probably been a lake centuries ago. Workingmen were building a railroad through it and throwing up thousands upon thousands of strange bones. These the professor gathered up in large quantities, and before he had finished his examination of them he had traced the origin of the horse six states back. His discovery complete, he sent its results and full specimens of the bones to different scientific schools and was greatly honored therefor. Probably no discovery of recent times attracted so much attention.—*N. Y. Star*.

A FACT SHOWING A RESEMBLANCE BETWEEN THE EARTH AND MARS.—The curious suggestion made by Mr. S. E. Peal of Assam, India, in demonstrating that Greenland is covered by a huge ice-cap, may have unconsciously solved an interesting problem in astronomy. It has long been noticed that the polar caps of Mars are not diametrically opposite the southern one, not being centrally placed over the axis of rotation, and it now appears that a like anomaly may exist on the earth. In Antarctic waters are seen immense flat-topped bergs of ice 2000 feet high and several miles long, which are evidently fragments broken from a permanent cap directly over the south pole; while in the Arctic region thin field-ice preponderates and bears out the assumption that the north pole is covered by a deep sea, quite free from islands, in which the ice finds no anchorage and is floating and temporary. Nansen's recent expedition, therefore, may result in proving that the Greenland continent underlies one of the two polar ice-caps of the earth, and in giving a clew to the condition of Mars by showing a closer resemblance to our planet than had been hitherto observed.—*Brooklyn Standard*.

UNEXERCISED GENIUS.—Genius without exertion is practically nil. Emerson says: "Genius unexercised is no more genius than a bushel of acorns is a forest of oaks. There may be epics in men's brains, just as there are oaks in acorns, but the tree and hook must come out before we can measure them. We very naturally recall here that class of grumblers and wishers who spend their time in longing to be higher than they are, while they should be employed in advancing themselves. How many men would fain go to bed dunces and wake up Solomons! You reap what you have sown. Those who sow dunces seed, vice seed, laziness seed, usually get a crop. They that sow wind, reap a whirlwind. A man of mere 'capacity undeveloped' is only an organized day dream, with a skin on it. A flint and a genius that will not strike fire are no better than wet junkwood."

IS THE EARTH GROWING COOLER AND ITS CRUST THICKER?—The *Scientific American* says: There is nothing positive as evidence of the prehistoric condition of the earth and its crust. The geological succession of the strata forming the crust of the earth suggests the generally received theory of the gradual cooling of a former fluid globe. The volcanic and earthquake evolutions upon its surface now are suggestive of a thin crust resting upon a heated fluid center. Deep borings and mines also corroborate this view. Volcanoes have become active after many years of silence, and many volcanic cones and craters are known to have been silent during the historic period. Our large lakes have probably become somewhat shallower from geological changes as well as from drainage deposit of silt.

MOVEMENTS OF SALMON.—Very little is known of the movements of salmon after they leave their spawning-grounds; but it has recently been noticed that many salmon of the rivers of Finland contain copper hooks of peculiar form. It is now known that these hooks are used in the north of Germany, and that salmon of the Finnish rivers must descend in winter to the Baltic coasts of Germany.

TEMPERATURE OF THE MOON.—The most recent researches of Prof. S. P. Langley indicate that the mean temperature of the sunlit lunar soil is probably not greater than 32°.

GOOD HEALTH.

Keeping Healthy.

It is an old saying that an ounce of prevention is worth a pound of cure. Inspired by this idea, a kind friend, the other day, sent me a cleverly written little book on the art of keeping healthy. The author seems to think that in the absence of accidents nothing is easier than reaching the port of a good old age, "a consummation devoutly to be wished." He tells us what to eat, drink, and avoid; how to chew our food, when to go to bed, when to get up, what should be the proper temperature of our bath, how often we should wash our feet, how much exercise we should take, and when to take it, and what we should wear next to the skin in summer or winter. In short there is nothing from the brushing of the teeth in the morning to the blowing out of the light in the evening that may not be learned from this little manual of health.

There is no branch of literature in our day in which the activity is so great as that devoted to the art of keeping well. The press teems with such books and the monthlies and periodicals come laden with suggestions on the subject. The abundant supply of this sort of literature must indicate a corresponding demand, and no doubt many are greatly benefited thereby. But how far this benefit extends may be a question worth considering. It is certain that if any one expects that this attention to the art of prevention will become so general and intelligently understood as greatly to supersede the need of the family doctor, he indulges in a vain hope. This sort of literature is rarely perused by the class it is intended for. People in good health care little for it. Their physical mechanism runs so easily they hardly feel they have a body. It is only when good health is lost that it is appreciated, and then prevention is too late.

And then may not the promiscuous consultation of such elementary guides to health tend to create a morbid solicitude that may often end in confirmed hypochondria? It is very easy for some people to imagine they have the dyspepsia one day, a tapeworm the next, and finally conclude that it is hepatic liver or a severe attack of Bright's disease, when really nothing serious is the matter with them. More than half the success of mental healing or the faith cure comes of this kind of morbid imagination. Then the minute simplicity of the directions for preventing or curing disease may load many, puffed up with a little smattering of knowledge, to think they can dispense with the aid of a doctor, and by delay and tampering with remedies greatly imperil their chance of recovery. Have we not all known just such cases? Have we not known many who could have been cured or at least greatly benefited if they had sent for an experienced practitioner in time? We have not the least doubt that many cases of mortality are directly chargeable to the family doctor-book.

Then akin to this sort of literature is the very kind and amiable feeling that prompts so many to offer advice to the sick or complaining. With the best motives in the world they tell us how they or some friend in a similar condition found relief in a certain kind of diet, decoction or drug. They are sure it would benefit us if we gave it a fair trial. But such people forget that what is beneficial to one may prove hurtful to another; that there are no fixed rules in matters of health, and each one must largely be a law unto himself. One may find watermelons, cucumbers and pickles absolutely refreshing, while another finds them deadly poison. One finds a cup of tea late in the evening promotive of a good night's rest, while it would keep another wakeful and restless. One man may eat a big piece of mince pie with a glass of older and go to bed and sleep soundly, while another who tries it dreams that the devil came and sat cross-legged upon his stomach, holding the Benker Hill monument in his lap. There are some who find a light breakfast the best preparation for a good day's work and a sure cure for rheumatism; others find a hearty breakfast indispensable to any activity, mental or physical, and the only safeguard against dyspepsia. One cannot drink coffee; another finds it essential. Early rising clears one man's brain; it makes another stupid and incapable all day. One finds a daily cold bath the making of him; another tries it and declares it nearly killed him. One needs two hours' daily exercise for any effective brainwork; another finds the less he takes the better he thinks. So it is about blankets, woolen underclothes, and about every habit, article of diet or drug; that, in short, what is one man's food is another man's poison; that in all matters of health there is no absolute standard; that, owing to some inscrutable peculiarity of individual constitution, there are almost as many requirements as there are persons and tastes, and each one to a great extent must find out for himself what agrees with him.

THE GARTER NO SOURCE OF DISEASE.—Contrary to the general idea, the garter is not, as a rule, a source of disease. The *Medical Record* says: "Varicose veins occur oftener in men than in women, and proportionately oftener in athletes and men trained to severe exertion. There are many things, indeed, which, cause them, and artificial constriction of the limbs seems to be a very remote and rare factor. In England

we are told that the demand for "anti-varicose" stockings is chiefly made by full-fed men who lead sedentary lives and drink more wine than is good for them. A wearer of the anti-varicose stocking feels worse after a series of dinner parties, when the tempting varieties of the menu lead him to indulge too freely in the pleasures of the palate. Obviously, no very bad case can be made out against the garter, provided it is a good garter, combining the maximum of support with the minimum of constriction, blending harmoniously with the hose and the circulation. The garter has come to stay; and the doctor had better prescribe a proper kind than preach its abolition.

USEFUL INFORMATION.

Soap-Bubbles.

The making of soap-bubbles is an interesting employment of the philosopher as well as of the child. The former finds much in the way of scientific interest attached to the operation, while the latter is generally absorbed in the matter as a pure piece of amusement. How to make the largest kind is told as follows:

Next to white castile, the mottled castile gives the best results. The soap being obtained, a friendly druggist must carefully weigh out 60 grains (for exactness in proportions is needful) for each ounce of water—that is, one drachm (according to the apothecary's weight of the old arithmetic), and when the weighing is done and the obliging druggist thanked for his kindness, the rest is plain sailing. A bottle with a sound cork is the next requirement. It must be large enough to hold three or four times the quantity of solution you wish to make. Do not prepare too much at one time; two ounces of soap solution will be a good quantity, and for this a six or eight ounce bottle will be the right thing. The bottle must be well cleaned and then thoroughly rinsed out with soft water—which, by the way, should be used for all the operations.

All being ready, the soap is cut into fragments small enough to enter the bottle. Measure an ounce of water for each drachm of soap; this can be done with a teaspoon, eight spoonfuls making an ounce. Having poured the water and put the soap into the bottle, we have now to await perfect solution, which will happen in the course of two or three hours if the bottle be put in a moderately warm place. Then add glycerine to the soap solution, the quantity varying with our ambition. I have found that one-half the volume of the solution gives excellent results; that is to say, to each ounce of water add one-half ounce of glycerine, measuring the quantities instead of weighing them in both cases. The bottle is now to be tightly corked and well shaken; then set aside for two or three hours more, and well shaken again. These alternate periods of rest and agitation should continue for a whole day. Finally, concludes Thomas W. Chittenden in *St. Nicholas*, let the bottle stand undisturbed and tightly corked for 24 hours. Bubbles of great size and beauty may be blown with this solution.

The "Accident" of Discovery.

Usually important discoveries are the result of the expenditure of much skill and labor; but it is quite often the result of the merest "accident." Nearly every one is familiar with Goodyear's discovery of vulcanizing rubber, also the late discovery of saccharine; but the particular object of this paragraph was a reference to the accident which led to the discovery of gun-cotton, which, according to the *Western Druggist*, from which we copy, has never before found its way into print. That paper says:

In 1846, Boettger and Schoenbein had a laboratory in Frankfurt, Germany, where they also gave instruction in chemistry. They resided with their families in the building where the laboratory was located, and Mrs. Schoenbein, being a very economical lady, would "gather in" any odd material found lying about the laboratory. It so happened one morning that a lot of oakum, used in wiping off dishes similarly to the present use of sawdust, was found by the frugal wife, who directed a domestic to wash it and spin it at night as "recreation" after a hard day's work. This young person by some accident fell into the embrace of Morpheus, and Mrs. Schoenbein awakening late at night and finding the light burning, rushed into the room with a candle in her hand to see what was the matter. In bringing the flame a little too close to the oakum on the spinning-wheel, a terrific explosion took place, and persons appearing upon the scene found both mistress and servant in a fainting condition. Upon investigating the cause next morning, it occurred to Schoenbein that the oakum had been used to clean a large dish containing sulphuric acid and potassium nitrate used in illustrating an experiment. The acids had converted the impure cellulosic oakum into pyroxylin.

MODERN BATTLE-SHIPS.—It is said that nearly all the first class battle-ships of the British navy are practically in a disabled condition, and the Admiralty dare not send one of them to carry the flag of the Commander-in-Chief to the Mediterranean.

ELECTRICITY.

Electricity and Legislation.

Gov. Campbell of Ohio, in his recent inaugural address to the Legislature of that State, says: "The duty of investigating the generation and distributing electric currents is one which presses upon you. The investigation should be prompt and thorough, and such action taken as may, in your judgment, throttle this evil in its infancy." The evil referred to is, of course, the dangers which arise from defective wires.

The Governor seems inclined to put upon the Legislature a somewhat difficult task for such a body. The average State legislator would find it rather a difficult task to "investigate the generation and distribution of electric currents." The Governor further says, unless something is done in this direction, "the companies which put up and control them [the wires] will have grown so rich and powerful that the passage and enforcement of proper laws will be difficult." The Governor seems to have written himself down as directly antagonizing one of the grandest steps in the progress of the age—one of the largest means yet discovered for providing the comforts and conveniences for man, and for developing the commerce and industry of the world. He moreover seems to think that the opportunity for profitable investment must necessarily lead to corruption.

Of course something in the way of legislation in regard to putting up and employing electric wires carrying heavy currents of electricity may be reasonably undertaken by even the average State legislator, but when such persons undertake to fathom and explain the principles involved in their operation, the work will very likely be fully as disastrous and futile as a rear and manual investigation into the business end of a mule.

There is no doubt much carelessness in putting up electric wires, and oftentimes a woeful neglect in making use of well-known safety appliances. Such things may properly form a basis for legislative action; but all investigations of the character referred to by Gov. Campbell can be successfully undertaken only by the most experienced and best educated electrical engineers.

REFINING SILVER BY ELECTRICITY.—A foreign exchange says the method of refining silver electrically, the details of which have been worked out by Mr. Moebius, is now coming into a somewhat extensive use. It is most suitable for the refining of aniferous silver containing about 11 per cent of gold, the cost in this case being only about 7d. per pound. The principle upon which the method is based consists in using, in an ordinary electrolytic bath, anodes of an argentiferous matte and a thin plate of pure silver as the cathode. The bath consists of a very weak solution of nitric acid containing about one per cent of the acid. The anodes, which are about 1/2-inch thick, with a surface of about 13 1/2 square inches, are placed in muslin bags, which retain the gold, platinum, peroxide of lead, and similar foreign minerals contained in the matte. The current used is 150 amperes, and the potential difference between the plates one volt. During the whole period of work, brushes are kept moving up and down the silver plates, which sweep off the silver deposited into troughs put for the purpose at the bottom of the bath. These troughs are removed from time to time, and the silver taken out and sent to the furnace. If the matte contains copper, this is dissolved by the nitric acid, but is not deposited on the cathode. The electrolytic method of treating mattes containing the precious metals will doubtless come into very general use when its value is better understood.

ELECTRIC POWER IN AGRICULTURE.—A consular note from Mons, Belgium, gives an interesting description of the part played by electrical power on a neighboring farm. A small ten-horse power dynamo was used to work a Ransome threshing machine, the rotatory shaft of the dynamo transmitting its high rate of speed to the shaft of the thrasher by means of an ordinary machine belt. The current driving the dynamo was conducted by an insulated copper wire from the initial source, a 16 horse power dynamo driven by a horizontal steam engine situated in the Chassart works, about half a mile distant. The loss occasioned by several transformations of power and the resistance offered by the wire amounted to only 40 per cent. The use of electricity for such work avoids all danger from fire when the wires are properly insulated.

ELECTRICAL FINGERS.—The scientists connected with the Johns Hopkins University, at Baltimore, are engaged in investigating the peculiar powers possessed by the fingers of Louis Hamburger. When the hands of the young man are thoroughly dried and touched to any polished object, they hold it like a magnet. He can thus raise a quantity of pine which will dangle from them, his index fingers possessing the quality more than any other. He also raises a glass tube weighted with a six-pound weight.—*Ex.*

DUCKS AND ELECTRIC LIGHTS.—Most kinds of night-flying birds and insects appear to have a great curiosity in regard to electric lights.

But a gentleman in Middleborough, Mass., has some tame ducks which seem to be perfectly crazy after such lights. When the lights shine, they go out into the street beneath it in a big flock and there promenade, flap and waddle in a high state of ecstasy. On rainy nights, when there is a puddle big enough in which to wet their feet, they are especially jubilant. When tired with their capers, they squat in the grass and blink at the brilliant light.

ELECTRIC LIGHTS IN FRANCE.—The first practical and permanent electric lights in France were introduced into some workshops in 1874. In 1878 they were first introduced into the streets, and in 1880 into private dwellings. The latest statistics show that nearly 1,000,000 horse-power is now converted into electric lights in that country, corresponding to a total intensity of about 200,000,000 normal candles; that the number of central stations exceeds 1500, and that of private installations 10,000, and that the capital sunk in electric lighting amounts to more than 1,000,000 francs. The United States has more electric lights in operation than all the rest of the world.

THE ELECTRIC LIGHT is being more and more used among the manufacturers of the wood-working class. It is practically the only light in use at the present time in sawmills, sash and door factories, furniture factories and all the wood-working establishments where a superabundance of inflammable material and more or less dust is unavoidable. Manufacturers recognize that they cannot afford to risk the lighting of their plants with lamps or even gas, with the danger from fire which these illuminators offer, and as a rule where motive-power is abundant and cheap, electricity, besides offering the best and safest light, is in the long run the cheapest.

ENGINEERING NOTES.

ANCIENT BRIDGES IN CHINA.—The Chinese suspension bridges, dating from the Han dynasty (202 B. C. to 220 A. D.), furnish striking evidence of the early acquaintance of the Chinese with engineering science. According to historical and geographical writers of China, it was Shang Liang, the commander of the army under Kaen Tau, who undertook the construction of the roads in the province of Shense, to the west of the capital, the high mountains and deep gorges of which made communication difficult, and which could be reached only by circuitous routes. At the head of an army of 10,000 workmen, Shang Liang cut through mountains and filled up the valleys with the soil obtained from the excavations. Where, however, this was not sufficient to raise a road high enough, he built bridges resting upon abutments or projections. At other places, where the mountains were separated by deep gorges, he carried out a plan of throwing suspension bridges stretching from one slope to the other. These bridges, appropriately called by the Chinese writers "flying" bridges, are sometimes so high as to inspire those who cross them with fear. At the present day there is still a bridge in existence in Shense 400 feet long, which stretches across a gorge of immense depth. Most of the bridges are only wide enough to allow of the passage of two mounted men, railings on both sides serving for the protection of travelers. It is not improbable that the missionaries who first reported on Chinese bridges two centuries ago, gave the initiative to the construction of suspension bridges in the West.

AN INTERESTING EXPERIMENT in jumping a torpedo boat over a boom was made recently at Porchester Creek by the officers of the British war-ship *Vernon*. The boom, 20 feet in length, differed from the usual spars which are used for the defense of harbors against torpedo attacks, in that it was six feet broad and was fitted with spikes, which it was supposed would hold the boat a prisoner. No. 49, a first-class torpedo boat, which had been strengthened for the purpose, was selected to attack the boom. She made a dash at the boom at a rate variously estimated from 16 to 20 knots. As she struck the spar, her stem was lifted out of the water almost as high as the boom itself, which sank on impact, and before it could rise to the surface the momentum of the craft had carried her over. She was subsequently berthed in the dry dock, and it was found that neither her cutwater nor her propeller had suffered in the least, nor had a single plate been bulged or started.

THE LONGEST BRIDGE.—What will probably be the longest bridge in the world is about to be constructed by the Roumanian Government across the Danube between Dudesti and Tchernavoda, thus effecting a junction between Huestenoga harbor and the Western railway of Roumania, which already runs as far as Dudesti. As there is a large tract of marshy ground on the left bank of the Danube where the bridge will be built, this will have to be no less than 20 miles in length.

THE HIGHEST LOCOMOTIVE SPEED.—London *Engineer* says there is no properly recorded instance of a locomotive ever having attained a greater speed than 80 miles an hour, and quotes Charles R. Martin as saying that higher speed is mythical.

SAN FRANCISCO:

Saturday, March 15, 1890.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Ledgeswood Improved Quarry Hoisting Engine; View in Marble Quarry, 179; Washburn's Adjustable Collar for Amalgamating Pans; Transverse Back-Stopping with Filling, in Chapin Mine, 187.

EDITORIALS.—Marble: An Improved Quarry Hoisting Engine, 179; Passing Events; Artesian Wells for Cities; Assessable and Non-Assessable Mines; Silver Discount and Mines; The Foundry Strike; Miscellaneous, 188; Transverse Back-Stopping with Filling; Fireproof Buildings; An Oregon Gold Mine; Adjustable Collar for Pans, 187.

CORRESPONDENCE.—Mines of a Rainless Land; Butte, Montana, Roads and Roadmaking, 180.

MISCELLANEOUS.—British Columbia Coal; Iron Sands; Prospecting for Coal, 180; Mining Camp Blatantists; The Postal Telegraph; Municipal Problems; Mining of Asbestos; Wide Tires; They Did Not Pay; A Sulphuric Acid Motor; Stamp-Collectors, 181.

MECHANICAL PROGRESS.—How Invention Has Revolutionized the Condition of Workmen; Characteristics of Emery-Wheels; Economy in Manufacturing Bolts and Nuts, 184.

SCIENTIFIC PROGRESS.—Extinction of American Game; The Wonders of Human Mechanism; Discovery of the Fossil Horse; A Fact Showing a Resemblance Between the Earth and Mars; Unexcited Genius; Is the Earth Growing Colder and Its Crust Thicker?; Movements of Salmon; Temperatures of the Moon, 184.

GOOD HEALTH.—Keeping Healthy; The Garter no Source of Disease, 185.

USEFUL INFORMATION.—Soap-Bubbles; The "Accident" of Discovery; Modern Battle-Ships, 185.

ELECTRICITY.—Electricity and Legislation; Refining Silver by Electricity; Electric-Power in Agriculture; Electrical Fingers; Ducks and Electric Lights; Electric Lights in France, 185.

ENGINEERING NOTES.—Ancient Bridges in China; An Interesting Experiment; The Longest Bridge; The Highest Locomotive Speed, 185.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 182-183.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 192.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, 192.

Business Announcements.

Passing Events.

The pleasant, sunny weather of the past few days is rendered doubly pleasant by the very dreary winter through which we have passed. There have been storms in the mountains and the roads have been again blockaded, but from present appearances we have seen the worst of a very bad winter.

The burning of the Reno reduction works is a sad loss to the miners of Nevada, but the works will doubtless be rebuilt.

The owners of "dry diggings" in the northern part of this State are doing better than for ten years past, and making money while the water is running. The miners, when floods and slides cease, will be able to work off lots of top dirt with the surface water. The river miners will be late with their windmills, for the waters will be high. Ground sluicing and hydraulic mining in Trinity and Siskiyou are being carried on with great energy and a long and prosperous season is ensured.

The foundry strike still continues, and both sides of the contest seem confident. Of course there is great inconvenience and loss to the owners of foundries, who maintain that if they are to run their works at all it must be on different conditions than those which have been existing.

Artesian Wells for Cities.

The city of Oakland is having trouble about the character and price of the water supplied to the citizens. The people have become indignant at the neglect of the water company to remedy the existing state of affairs, and the City Council does not seem disposed to give any aid. Mass meetings have been held which have been largely attended by the respectable tax-paying element of the community. A Citizens' Committee of 100 has been appointed, and the gentlemen composing it are now engaged in discussing the matter of water supply and the best means of furnishing pure water.

A prominent idea which has been suggested is that the people of certain districts join hands in boring artesian wells for the common good, each well to supply a certain section of the city. When this project was discussed it was a matter of surprise to find that a very large number of wells had already been bored in various parts of the city and that families were being supplied from them. Not that it was not known that there was artesian water to be had, but no one supposed there were so many wells. Moreover, arrangements are being made to bore others. As a result there is a great interest in this subject in a city where there are 65,000 people.

In some parts of Oakland good artesian water is procured at a depth of 85 to 95 feet and rises to within a few feet of the surface. This water is clear, pure and cold. To be used in dwellings and on gardens it must be elevated by windmill or engine into suitable tanks. It is not therefore practicable for individuals to own the wells unless they have large pieces of land which have to be irrigated—that is, large lots from a city point of view. But the residents of a block, by united action, can very easily have a well and engine which will furnish them all with a good water supply for domestic use. The ordinary city water answers for fire and street-sprinkling purposes.

In former times the city of San Francisco had many artesian wells, and some of them are in use to-day, but the Spring Valley Water Co. has settling reservoirs for its supply, which is not the case with the company which supplies water to Oakland. Therefore, artesian wells are more necessary to Oakland than to San Francisco.

The topography of the country about the bay of San Francisco is favorable for artesian wells, and there have been many more successes than failures in boring for water. Oakland has back of it a range of hills with numerous canyons and water can be obtained nearly everywhere.

We have from time to time in the MINING AND SCIENTIFIC PRESS given considerable attention to this subject of artesian wells in California. There is really very little difficulty in obtaining a supply for domestic use from such sources. Where one well has been bored successfully others can be also. It depends on the locality as to the depth, of course. We shall be glad to obtain more detailed information concerning the wells in Alameda county, or, in fact, any that bears on the artesian belt of the bay shore. The following Committee appointed by the Citizens' Committee of 100, to collect information on artesian wells and promoting the same in Oakland, will also be pleased to receive facts and suggestions relevant to the objects sought: Ross E. Browne, S. P. Channell, Wm. Collins, J. K. Piersol, J. L. Lyon, J. C. Kimble and A. T. Dewey.

The late mass meeting of 5000 or more Oaklanders, protesting against perpetuating the exorbitantly high rates prevailing in their city for an exceedingly inferior quality of water, has aroused a determination to seek some permanently better source of accommodation.

In the next number of the PRESS we shall have more to say on this subject.

MONTANA papers assert that Marcus Daly is about to resign the management of the Anaconda mine, and that Robert Dillon is to succeed him. Mr. Dillon is a miner with long experience and for some years has managed the affairs of Haggin & Hearst, in Mono county, California, and is at present in charge of their mining operations in New Mexico.

It is rumored that the Germania Smelting Company, Utah, will shortly start up its refining plant and do its own refining.

Assessable and Non-Assessable Mines.

The people who have been organizing mining companies under the laws of the State of New York are finding out that non-assessable stock is not such a blessing as they supposed. There the shares of all mining companies must be un-assessable. The result is that the mines cannot be properly worked, and many New York companies have undeveloped mines on hand. In many camps in the Pacific States and Territories are mines operated from New York, which are in a bad fix. The credit of the companies is low and people to lend them money are scarce.

Now the mining brokers and holders of shares favor an assessment law, or they want the companies organized under the laws of California, where the stock is assessable, and the mines can be worked. It is no argument against this system that there are instances of its abuse; since, were it not for the California law, many mines now developed and worked, would be idle.

The California laws are founded on common sense and experience. Each man is liable for the amount of stock he owns as to assessment. If he owns 100 shares, a 50 cent assessment means he shall pay \$50 or else his stock will become delinquent and advertised for sale. He must bear his share of the burdens as well as the profits. It is said that the capital invested in New York in the mining industry is between \$50,000,000 and \$75,000,000. Many of the companies are listed on the Exchange Board, but few are paying dividends, and many are not being worked because of lack power to levy assessments for the necessary money. So New York is forced to acknowledge that California knows best about one thing at least; that is, how to operate mining companies.

Silver Discount and Mines.

The Alice Mining Co. of Montana crushed 30,059 tons of ore last year, worth \$23.58 per ton. The average value of the silver was \$22.47 per ton and of the gold \$1.11. During the year the company shipped 797 tons of bullion, containing 1,097,606 60 ounces, the value of silver in the same being \$725,296.03, and the value of the gold \$33,388.66.

For the greater part of the year the 60-stamp mill has been running, but the 20-stamp mill laid idle for the reason that the discount on silver was so great. The selling price of silver having advanced to about 95 cents per fine ounce during November, and to 96 cents during December, it was deemed advisable to put the 20-stamp mill in running order.

The entire silver and gold product for the year was \$753,684.69, which is reckoned at the old standard value of \$1.29.29 per fine ounce for silver and \$20.67 per fine ounce for the gold. The discount on silver was \$212,153.18, or a net yield in gold dollars of \$546,531.51. This discount is the greatest for any year since the company was organized. The figures will show how the silver mines suffer from the discount. There was a dead loss of \$212,153 in one mine alone. Notwithstanding the company had to work against this great depreciation and the low grade of the ores, one dividend of \$25,000 was paid and the remainder of the indebtedness, owing for the purchase of the Magna Charts, Valdemere and other mines, amounting to \$45,000, has also been paid.

PENNSYLVANIA MINERS.—There is much suffering among the miners in the Lackawanna region. Many families are on the verge of starvation owing to the scarcity of work in the collieries. They are being relieved by the Citizens' Relief Committee, which has opened a store of supplies and established canvassers to learn the condition of destitute applicants. No such misery was ever known among the anthracite miners as now exists, their time checks invariably showing them to be in debt to the operators for rent and other supplies. The miners are not working enough to give them a living.

THE cast-iron drum of one of the mangles in the Contra Costa laundry, Oakland, exploded last Monday, killing one girl and severely injuring another. The machine was being used for the first time. It was made in Oakland, and a coroner's jury has brought in a verdict that a girl was killed by "the explosion of an imperfectly constructed steam heater of a mangle machine."

The Foundry Strike.

There is not much change in the situation among the foundrymen and the striking molders. The men are still out and claim that the foundries will have to employ them in the end. On the other hand the manufacturers say they will send East for their castings if necessary, rather than take the men back on the old conditions. The Engineers and Foundrymen's Association has issued the following circular:

To the Foremen, Apprentices, and Employees of the foundries controlled by the Iron-founders' Association: WHEREAS, It has come to our knowledge that threats have been made against those now at work to the effect that if they refuse to take sides with the Molders' Union in the struggle now in progress, they will be denied the right to work in this city after the difficulty is settled, and have in other ways been intimidated.

In view of the above, the Engineers and Iron-founders' Association, individually and collectively, do here

Resolve and Pledge themselves: That the men and boys now at work, and those who may hereafter come to work, shall be protected at all hazards and at any cost.

Furthermore, that no settlement of the strike shall be made which does not fully protect all who have been faithful to our common interests.

We furthermore pledge ourselves to retain in our employ, while our establishments are in existence, those who stand with us at this time.

We are prepared to enter into contracts with molders for a term of service extending over one or two years, if desired, at wages varying from \$3 to \$4 per day of ten hours, according to the ability of the workman.

The Engineers' and Iron-founders' Association, by Ira P. Rankin, President.

The Mission Iron Works, owned by Wm. Axford, have closed down and the 20 molders and apprentices thrown out of work. The Judson Iron Works across the bay have also closed down, having had trouble about the apprentice system.

The men here talk of starting a co-operative foundry, but as they have no capital for such an enterprise, it is not probable anything will be done. If it were started, however, the foundrymen would not be displaced but would be glad to get their castings from such a source and let the men fight out their own labor difficulties. Some of the striking molders have left the city and others are reported as having returned to work. There is also a report that 75 non-union molders are on their way from Philadelphia to this city.

The foundry proprietors all say there would have been no strike if the molders had not limited the amount of work to be done in a day. We are now in direct competition with the East. Higher wages are paid here and higher prices for iron and fuel. To fight competition and also to maintain a contest with their workmen is more than the foundrymen care to do. Placing the minimum rate of wages at \$3 50 per day, allowing only one apprentice to every eight journeymen, thus depriving employers of a class of labor suitable for the cheaper grades of work, forbidding working by the piece, asking for a reduction of working hours, and finally restricting each molder's output, form a condition of affairs that the foundrymen could no longer tolerate.

THE TECHNICAL SOCIETY.—At the last meeting of the Technical Society of the Pacific Coast those present interested themselves in the examination of two improved transits, a level, a new article of tracing paper, a surveyor's rod, rules, etc., brought here from New York. The secretary, Otto von Geldern read a paper entitled "Notes on the Dry Dock and Cofferdam at the Mare Island Navy Yard." This paper was filled with statistical detail, some of it requiring illustration on the blackboard and by means of tracing paper. He commenced with the inception of the building of the docks and dam in 1873; gave a description of every portion of the work and its cost in detail; showed what subsequent alterations in the original design had been made; compared the cost of construction with that of similar works in other countries, and added that, although \$2,738,745 had been spent on the work, it was still unfinished.

THE Sowden brothers, two miners who were working a claim near Weaverville, Trinity Co., were killed by a landslide, last week. The two reservoirs above the claim were literally obliterated, and the sliding earth had carried off the pipe, giants, etc. The bodies of the two men were found in the bed of the creek.

Transverse Back-Stoping with Filling.

In the Chapin iron mine, Lake Superior, the deposit is very wide, and the surrounding rock is soft, so they had to give up what they called the "modified Nevada system" of mining and adopted the standard "filling system" employed in European mines, where timber is scarce. The cut given herewith shows the method of transverse back-stoping with filling.

Where the ore is wider than 20 feet, the filling must be kept close to the back. The miners then proceed in the following manner: On the first stope, different parties commence to work 50 feet from each other in the ore drift run parallel with the main level, and make cuts about eight feet high and nine feet wide clear across the ore. If the ground is weak, props or sets of light timber are put up as the cuts advance.

These openings are then filled with rock, either before or at the same time as other cuts of the same size are made, alongside of the first ones. A third slice is then taken off, and the second is filled in the same manner; and so on, until the whole first stope is mined out. As the filling must be kept close to the back in order to prevent caving of the ore, it is necessary to shovel most of it. It should, however, be borne in mind, that as solid ore is mined and loose rock takes its place, and as the specific gravity of the ore is at least $1\frac{1}{2}$ times greater than that of the rock, it is not necessary to handle more than four tons of rock for every ten tons of ore mined. As soon as the filling is put in, it is planked over.

Before work is commenced on the second stope, ore chutes and rock-winszes must be prepared. Raises to be used for ore-chutes and ladderways are made from the side of the main level to the top of the second stope, and cross-cuts are driven into the ore. These chutes could be located in the ore and connected with the main levels by cross-outs; but as the tramming will shortly be done by machinery, it is preferable to have the chutes open directly into the levels. The ore-chutes are placed 50 feet from one another, and the rock-winszes are sunk 100 feet apart from the next higher level.

The first thing to do on the second stope is to connect the rock-winszes with the crosscut leading to the ore-chute, after which the ore will be taken out and filling brought in in the manner above described.

A third stope is then prepared and mined in a similar way, and so on until the whole lift is mined out.

On account of the soft character and the great width of the ore, it sometimes cracks off and settles down on the filling. This will not cause much difficulty, if the filling is kept up close to the back on every stope.

If a block of loose ore is met with, it is necessary to put up drift-sets and drive laths, in order to keep the ore from running.

The ore chutes are cribbed up for the first 20 feet large enough to hold about 50 tons of ore, and then narrowed up to a size of $2\frac{1}{2}$ feet square. From this point they are built circular $2\frac{1}{2}$ feet in diameter, by means of wedge-shaped blocks of wood cut out in the saw mill. Care is taken on dumping the ore into the chute that it is not allowed to accumulate and rise in this circular part. Ladderways are cribbed up on the side of each ore-chute.

The rock mined in drifts or shafts is, of course, used to fill the excavations in the ore. If, however, this rock is not sufficient, a very suitable filling-material can be obtained from a sandstone quarry near by. The sandstone is trammed to one of the shafts and lowered to the level next above the lift where the ore is mined. From the shaft it is trammed on this level to one of the rock winszes and dumped. It is then drawn on a temporary chute built at the bottom of this winsze, and trammed to its destination.

Fireproof Buildings.

The frequent cases of loss of life and property by fire in so-called fireproof buildings has suggested to G. Lunderschlager, of Sunol, Alameda county, an improvement in construction for hotels, school-houses, factories, tenements, etc., which shall lessen, if not obviate, the danger. In a building which, for instance, is 200 feet front and five stories high, he constructs three partition walls through the whole depth, these being numbered 1, 2 and 3. The stories are also numbered 1 to 5, the partitions

in each story being connected by halls passing through the walls and these being closed by self-acting iron doors. Each partition has a separate exit, including the main and rear entrance. There is an alarm bell in the hall of

3, and so the occupants of every part of the house know at once where the fire is located and can act accordingly. The walls are double and hollow, pipes connect from the outside with this hollow space, so whatever draft there is

WASHBURN'S ADJUSTABLE COLLAR FOR AMALGAMATING PANS.

each partition in each story, and each of the bells is struck at the same time by the alarm when sounded. At the breaking out of a fire, a general alarm is sounded, after which the first

will be carried up between the walls. The idea is to confine the fire and smoke in one room or on one side of a partition only. That is, it is intended to confine the fire within the partition

TRANSVERSE BACK-STOPING WITH FILLING, IN CHAPIN MINE.

number of peals designates the partition, the second story. Suppose, for instance, a fire breaks out in partition 2, story 3; after the general alarm, the first peal of two shows the partition 2, the second peal of three the story

in which it originated and let the smoke out through the top of the building.

NEARLY every hotel in Southern California is crowded with guests, mostly from the East.

An Oregon Gold Mine.

We were shown recently, by Mr. J. H. Robbins of Baker City, Oregon, a very rich sample of the sulphuret ore from the Elkhorn mine, which is about 15 miles from Baker City. Mr. Robbins has ordered from the Rison Iron Works of this city a 20 ton concentrating plant, consisting of rock-breaker, ore-feeder, Bryen mill, four Frue concentrators and a Feltou wheel, and this will be ready for shipment in about a month. The mill will be put up on Pine creek, some 12 miles from Baker City.

The ledge of the Elkhorn mine is six feet wide, and one foot of it is the very rich ore shown us. They have been shipping this to Denver without concentration, and it has paid them about \$200 per ton above all expenses. The rich portion assays \$350 per ton, mainly gold, although there is from \$10 to \$15 in silver. There is no free gold in the rock. They have shipped 100 tons that netted them \$200 per ton—in fact Mr. Robbins has paid his stockholders \$15 per share on 400 shares, and the company still owns 100 of the 500 original shares. The mine has no debts and pays as it goes. It is a private company and owns four claims. They are running a tunnel, which at length of 700 feet will tap the vein at a depth of 300 feet. No pumping is done, the mine draining itself. There is plenty of wood at the mine, and they have abundant water-power with 160 feet head for the wheel at the mill-site. The mine being close to the railroad, everything is cheap. In shipping the ore to Denver, Mr. Robbins says that he receives six cents on every lot of ore. One foot of this ledge is unnecessary to concentrate, being simply a mass of sulphurets; but with their new plant the whole ledge can be utilized. A specimen of this ore has been placed in the Mining-Bureau museum, where it can be seen by any one.

Adjustable Collar for Pans.

One great trouble millmen have with grinding-pans is to so adjust the driver that it will run true and the shoe and die wear on all sides of the pan alike. Frequently the shoe and die will be worn unevenly, being worn away on one side of the pan while on the other an inch thick remains. This causes a loss of iron, and, moreover, when the driver and muller do not run true good work cannot be done.

T. A. Washburn of Gold Hill, Nev., has recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency an adjustable collar for grinding and amalgamating pans, which is shown in the cut herewith. With this collar the difficulties referred to above are obviated. The set screws can be adjusted in a few minutes' time and the driver made to run true. In putting these collars on the driver, care should be taken to have the set screws come well up under the flange of the collar so as to hold it close up to the neck of the driver. In making new drivers, allowance should be made for a new collar about four inches long. In old drivers, as long a collar as possible should be used so as to wear out the shoes and dies. Set screws made of seven-eighths steel, with jam-nuts, should be used. These collars have just been introduced in the Justice mill, Gold Hill, Nev., and give great satisfaction. Mr. Wash-

burn may be addressed as above for further information.

OAKLAND, Alameda county, expects to have a \$300,000 public building.

FRENCH IMITATION OF WOOD.—French artisans excel in imitating mahogany, ebony and satin wood, says the *Builder and Wood-Carver*. So nearly do they contrive to render any species of wood of close grain like mahogany in texture, density of hue and polish, that many expert judges will often mistake the imitation for the natural wood. The following is the mode: The surface having been planed and rendered perfectly smooth, the wood is rubbed with diluted nitrous acid, which prepares it for the materials subsequently applied. Afterward, to a filtered mixture of one and one-half ounces of dragon's blood, dissolved in a pint of spirits of wine, is added one-third that quantity of carbonate of soda. The whole constituting a very thin liquid, is brushed with a soft brush over the wood. The process is repeated with very little alteration, and in a short interval of time the wood assumes the external appearance of mahogany. If the color position has been properly made, the surface will resemble an artificial mirror, and should this brilliancy ever decline, it may be restored by rubbing the surface with a little cold-drawn linseed oil.

Attention, Southern California Miners.

WORKS FOR SALE.

The Works are situated at Daggett, Cal., in the Calico Mining District, and on the side-track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power Engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to GILLISPY & CHILDS, 123 California St., San Francisco.

Dewey & Co.'s Scientific Press
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Paul Dry Amalgamating Barrel Process.

I hereby certify that I made, at the Calaveras mine, a comparative test, as between stamps and silver plates working WET and the Paul Barrel Process working DRY. The quantity of ore worked was 72 tons, all carefully divided and weighed for each test. The result from 36 tons worked by stamps WET was \$24.05 per ton. The result from the 36 tons worked by the Paul process DRY was \$92.00, making a difference of \$67.95 per ton in favor of the Paul Process. The test was as exact as it was possible to make it. Rock Drilling and Air Compressing Machinery

For TUNNELS, QUARRIES, MINES, RAILROADS

And Wherever Ore and Rock are to be Drilled and Blasted.

SEND FOR NEW CATALOGUE OF 1889.

RAND DRILL CO.,

23 Park Place, New York, U. S. A.

To Miners, Millmen, Dealers in Machinery, Etc.

The undersigned offers for sale at greatly reduced prices, machinery belonging to the

AUTO-PNEUMATIC CAR MOTOR COMPANY,

Situate in the City of San Francisco, on the block bounded by Folsom, Harrison, Sixteenth and Seventeenth Streets. Said machinery is new and has only been used long enough to test every part of it.

One Compound Steam Air Compressor, low pressure cylinder 12x20, high pressure cylinder 5x20, with inter-cooler and all connections complete.

One Air Tank, 48 inches in diameter by 16 feet length, tested to 300 pounds to the inch.

One Auto-Pneumatic Passenger and Motor Car, 30 feet long, standard gauge, with air tanks and engines complete. Engines, Compound, 6-inch and 11-inch cylinders by 12-inch stroke.

2000 feet or more of 20 lbs. rails with ties, bolts and fish plates, complete.

For further information apply to

FOR SALE CHEAP.

One new double circular Sawmill to carry 60-inch bottom saw, with wrought-iron hangers for top saw. Friction feed-works, patent steel screw double-throw head-blocks, with track iron, saw carriage and frame complete.

RISDON IRON & LOCOMOTIVE WORKS,

San Francisco, Cal.

THE WOOD WORKER.

Wood-Bending as an Industry.

There are comparatively few persons outside the carriage and boat building interest that know to what an extent the wood-bending business is carried, and the management that is necessary in carrying on a well-arranged wood-bending establishment. Few know that the fine carriages they ride in are very largely made of bent wood. The fellows of all their wheels are bent and made in two parts. The framework of coaches and heavy carriages is nearly all made of bent stock. They are not only better made, but are more cheaply made.

The frames of most of our pleasure boats are bent, and so are many of the frames of some of our finest sailing yachts. Furniture of many kinds has bent frame. All the celebrated Thonet chairs, which for comfort and beauty are not excelled in the world, are entirely of bent wood. The object of bending is twofold—sewing of time and stock, and stability and strength of the work when put together. We ought to add another—beauty of form. Bent carriage shafts are almost, if not entirely, new now, instead of the old-fashioned, clumsy, sawed ones.

It is a business that needs to be well understood, however, to make a success of it. Simply the forms to bend, or the steam-box to soften the wood in, do not make a success of wood-bending. We must know perfectly the nature of the stock to be bent, for stock is so variable that no two pieces bend alike. The length of time to be steamed, also, has much to do with the success in bending. Heavy work needs special care to make it come out in fine shape. The selection of stock, also, must be closely attended to.

Simple as the work seems to be, yet it is full of little details which must be strictly attended to, else the result is a miserable failure. The small number of places where wood is bent as a business, makes it an industry in which there is little competition, and if it is well understood, and the necessary details strictly attended to, it will make good returns for the money invested.—*Wood Worker.*

Out of Style.

Mahogany is now seldom used for furniture. Indeed, it is quite out of style. "A few years ago," said a New York furniture dealer, "no body cared much to buy bedsteads, sideboards, tables, book-cases or sofas made of any other wood than mahogany. Indeed, large pieces of furniture of any of the lighter woods were thought to make a rather vulgar display. The piano was the only exception to this rule. At all times rosewood was the most popular frame for one of these instruments, but this was not due to any notion that rosewood was handsomer, but simply to the fact that the great heaviness and density of mahogany stifled the music. Now black walnut, cherry, ash, oak and every sort of light wood that will take a high polish, are seen in fashionable houses, but of the heavy old wine-colored mahogany rarely a stick. I think it was the musical necessity of using a lighter wood in the manufacture of pianos that caused the revolution in general furniture-making. When people changing their residences saw the difficulty with which pianos were carried to the vans, they began to wonder how much power it would cost to lift them if they were made of mahogany, and this led to the reflection that fully two-thirds of the weight of the entire household furniture might be knocked off if it were manufactured in lighter woods.

"Then began the decadence of mahogany—decadence of its utility as a furniture wood, I mean, for in its integral parts it is almost everlasting. It is undoubtedly the richest, handiest and most stately of all woods, but its popularity has been crushed beneath its own weight. A few conservative people in New York, and many in England, still furnish their houses with it, but such persons are not afflicted with the migratory fever that leads the average American family to seek a new home about once in two years. Mahogany furniture once placed in position, seems to be nearly as immovable as when the dark wood was in its native forests, and the restless, nomadic householder of to-day does not care to be anchored to his dwelling."—*N. Y. Sun.*

KNIFING-IN is a term of comparatively recent origin. Strictly speaking, it refers to a quick process of filling the grain of wood, instead of using rough stuff cut down with block pumice-stone. The paint is mixed quite heavy—really a soft putty—which is brushed on heavy, and after it sets a little it is worked into the wood with the putty knife, and also worked down as level as possible, but left somewhat heavy on the wood. It is allowed two or three days to harden, and is then cut down nicely with sandpaper. If properly done, it stands for the completion of the surfacing process, and it is followed by the color coats. It is better adapted to express wagon bodies than to vehicles having large, plain panels. Express wagon bodies are cut up by the rails into a number of small panels, and unless the panels are filled and "knifed out" before being put in it is most tedious work to rub them out of rough stuff. The paint will dry and cut down sharper if it is composed of one-third fine yellow ochre, and it may be colored to agree somewhat with the color that is

to be used, as lead color, red, green, etc. When mixed tough and allowed time to harden properly it wears very well, but of course it does not afford as much protection to the wood as a heavier body of paint properly applied.—*Painter's Magazine.*

CREMONA WOOD FOR CHAIRS.—A Brooklyn furniture dealer advertises solid cremona chairs. The cremona tree is well known to lumber merchants, and the immense cremona forests, in the heart of Maine, afford employment to hundreds of men every winter. The white cremona is preferred to the pitch variety for making furniture, but the Georgia cremona makes excellent floors. The cremona wood absorbs stain very readily and finishes very well. The cremona tree is a cousin of the Pompadour hick, which furnishes the feathers for the Pompadour fan, and of the Cashmere goat, which furnishes the wool for cashmere dress goods, and the common ancestor of the three is the hainung.—*Ex.*

SHOE PEGS.—One of the great wood-working industries of this country and a rapidly growing one, is the manufacture of shoe pegs. The capital invested in the ten factories engaged in this industry amounts to \$175,000 and gives employment to 300 hands. Within the recent past, large quantities of shoe pegs were imported from England, but now the United States exports to England, as well as to almost every European country. To the uninitiated it will appear as one of the conundrums of the age how they can be produced at the prices they command in the markets, viz.: 35 cents per hundred for those called two-eighths up to 95 cents for eight-eighths.

PROGRESS OF WOOD WORKING MACHINERY.—The march of progress is to be seen in the highest degree in the line of wood-working machinery. Away up and ahead of the front ranks is found the Egan Company of Cincinnati, O. Their original time and labor-saving machines have a heavy and steady demand from not only every section of this country but from the outside world. This firm are builders of wood-cutting machinery of all kinds, and they lead in the production of novel machines.

WOOD-CARVING IN SWITZERLAND.—The industry of wood-carving, according to a recent publication, was introduced into Switzerland some 60 or 70 years ago by a native of Brienz named Christian Fischer, who need to spend his spare time in making trifling objects for sale. He started a night school for the benefit of the neighborhood, and thus laid the foundation of an industry which now gives employment to between 5000 and 6000 persons.

ORDINARY WHITEWOOD can be given the appearance of black walnut by first thoroughly drying the wood and then warming two or three times with a strong aqueous solution of extract of walnut peel. When nearly dried the wood thus treated is washed over with a solution made of one part (by weight) of bicarbonate of potash in five parts of boiling water. After drying thoroughly, rub and polish.

THE COLORADO CANYON.—The engineers who have lately made the successful trip through the Grand Canyon of the Colorado river say that the reports about discoveries of valuable deposits of rock salt and coal are all nonsense. No prospecting for mineral was done. No one familiar with prospecting for ore was with the party after the departure of MacDonald. There may be valuable deposits of mineral along the canyon portion of the river, but not to the knowledge of the party, and there certainly are not large deposits of salt or coal.

A. S. RINGGOLD and his son-in-law, Edward A. Wood, were arrested at Spokane Falls on Friday night for arson. The elder man confessed to a plot, with several others, to burn the town because they were dissatisfied with the distribution of property. Seven five-gallon cans full of coal oil and a quantity of waste and oiled shavings were found in Ringgold's room.

MECHANICS' INSTITUTE.—The Board of Trustees of the Mechanics' Institute met on Saturday evening, and elected the following officers for the ensuing year: Pres., David Kerr; V. P., Irwin C. Stump; Treas., A. W. Starbird; Rec. Sec'y, C. F. Bassett; Cor. Sec'y, S. J. Hendy. The Institute now has 3970 members in good standing.

THE Pless dredger, built at the Globe foundry, Stockton, has been launched. This is the fourth built in that city by W. P. Pless, who has several patents on his dredging machinery.

IN the higher mountain ranges of Colorado they are having a similar experience this winter to California. Immense quantities of snow have fallen, impeding travel and hindering work.

A NUGGET worth \$150 was found in P. Gillie's dam at Los Burro, Monterey county. It will surprise many California miners to learn that there are nuggets in the Coast Range.

WITH snow five feet deep at Sehome, Wash., the people are still obliged to fight a forest fire that has been raging near town for several weeks.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING MARCH 4, 1890.

- 422,683.—CAR BRAKE HANDLE.—C. W. Alden, Stockton, Cal.
422,491.—FARM GATE.—F. W. Beardslee, Berkeley, Cal.
422,897.—FRUIT-DRIER.—W. A. Beck, S. F.
422,698.—CENTRIFUGAL PULVERIZER.—Jos. Behm, San Jose, Cal.
422,727.—CAR-WHEEL AND AXLE.—T. C. Churchman, Sacramento, Cal.
422,576.—KNIFE-BOX RUBBER FOR PRINTING PRESSES.—W. H. Eager, S. F.
422,750.—POLISHING POWDER.—Emma P. Ellis, S. F.
422,581.—QUARTZ-MILL.—J. W. Fairfield, Pacific Beach, Cal.
422,793.—FEED-WATER HEATER.—E. C. Jordan, Sacramento, Cal.
422,817.—CAR LOCK.—E. C. Merrill, Oakland, Cal.
422,831.—GATE.—Wm. A. Pierce, Napa, Cal.
422,630.—HEATING APPARATUS.—J. Rice, San Jose, Cal.
422,892.—CLIP FOR ROPE TRAMWAYS.—R. Rowland, Romley, Colo.
422,636.—SHELL FOR HIGH EXPLOSIVES.—A. W. von Schmidt, S. F.
422,840.—GATER BOOT.—J. Schroeder, S. F.
422,662.—WRENCH.—J. Tomlinson, Folsom, Cal.
422,664.—PHOTOGRAPHIC SHUTTER.—J. R. Trego, S. F.

The following brief list by telegraph, for March 11, will appear more complete on receipt of mail advices:

California—James A. Angwin, Oakland, machine for applying hose couplings; Milton A. Cleman, assignee of Darwin O. Livermore, Los Gatos, ash fastener; Warren E. Mills, S. F., device for loading ships; Viola Moore, S. F., music-stand and portfolio; Joseph L. Stillman, Fresno, ant trap; Joseph S. Turner, San Fernando, ash-fastener; George A. Pratt, Brownville, book index and casing.

Notes.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PHOTOGRAPHIC SHUTTER.—Joseph R. Trego, assignor of one-half to Henry C. Owens, S. F. No. 422,664. Dated March 4, 1890. This improvement in photographic shutters and the means for operating them consists of an air-impelled piston reciprocating in a cylinder, a piston-rod and slide and a lever connected with the shutter and engaged by said slide, so as to be opened, and mechanism for closing the shutter when released, together with certain details of construction.

CENTRIFUGAL PULVERIZER.—Joseph Behm, San Jose, No. 422,698. Dated March 4, 1890. This invention relates to certain improvements in apparatus for pulverizing ore, and is especially applicable to an apparatus for which letters patent were issued to the same inventor Nov. 6, 1888. This patent covers improvements in construction on the other machine.

QUARTZ-MILL.—Jason W. Fairfield, Pacific Beach, San Diego Co. No. 422,581. Dated March 4, 1890. This is one of that class of mills for crushing quartz and other substances, in which the material is crushed or pulverized within a cylinder or casing by the action of a crushing muller or weight, and the invention consists in the novel construction and arrangement of the parts.

CLIPS FOR ROPE TRAMWAYS.—Robert Rowland, of Romley, Cheffes county, Colorado, assignor to A. S. Hallidie, S. F. No. 422,892. Dated March 4, 1890. This invention relates to that class of clips for use in connection with endless ropeways for carrying the load and container in which a flexible leaf is caused to bend over and tighten upon the wire rope, said leaf being secured to and carried by a body portion, from one end of which the load or container is carried. The general object of the invention is to provide an improved clip of this class in which the parts are all independent and separate from one another, whereby when any part is worn out it may be readily replaced by a new one.

GATE.—Wm. A. Pierce, Napa. No. 422,831. Dated March 4, 1890. The invention relates to that class of gates which are operated by means of suitable connecting cords or ropes, whereby the gate is moved from side to side and close the roadway. The object is to provide a simple and effective gate adapted to be readily and easily operated, moving with but little exercise of power and with the minimum of friction.

CAR-LOCK.—Eugene C. Merrill, West Oakland. No. 422,817. Dated March 4, 1890. This is a locking device for car-doors consisting of a haap connecting the door with the door frame, and having a transverse groove or channel, a vertically sliding bolt or bar engaging said groove and a lock with a bolt which engages and retains the sliding-bar.

KNIFE-BOX RUBBER FOR PRINTING PRESSES.—Walter H. Eager, S. F. No. 422,676. Dated

March 4, 1890. This invention relates to certain improvements in the apparatus connected with printing and folding machines and which is designed to sever the paper at the proper point. It consists of improved elastic supports which are placed in the knife-box upon each side of the knife. In presses which print from continuous rolls of paper a knife is fixed in the knife-box at the proper point so that the paper will be pressed upon the edge of the knife by a roll between which and the knife the paper is passed, and this action severs the paper. This invention consists of a rubber strip made continuous and the upper edge standing at the proper level with relation to the edge of the knife, and in this strip transverse slots or channels are cut. By reason of the cuts or channels in the edges of the rubber through which the points project, the inventor is enabled to make the rubber much more elastic by allowing spaces into which it may be compressed when the pressure is brought upon the edge, and by this means he is enabled to substitute the continuous rubber strip for the wooden strips heretofore in use. It is easily retained in place in the box.

An Improved Quarry Hoisting Engine.

(Continued from page 179)

moving the reversing lever either way from a central position, enabling a man of ordinary intelligence to handle a heavy block of stone of from 10 to 25 tons' weight safely and accurately, as it can be hoisted and lowered exactly to an inch.

For handling smaller blocks of stone, or the ordinary stone boats loaded with small stone, the quick speed can be used for hoisting, while, on attaining the desired height, the clutch may be thrown out of gear, and the stone or boat lowered by means of the foot-brake. All parts of the engine are made, in the manufacturers usual manner, to gauges, and on the interchangeable part system, and finished parts are always kept in stock. The entire engine is built in the most thorough manner to withstand the great strains, and will last for years without the constant expense and annoyance of repairs which are entailed upon the imperfectly constructed engines hitherto used.

Steel or iron wire rope is generally used with this style of engine, from one to two inches diameter, according to the size of the stone to be handled, although chain or hemp rope may be used if desired.

Every engine is thoroughly tested by steam before being shipped. Unless specially ordered, smooth drums are furnished with these engines and not grooved as shown in the engraving. Further information will be cheerfully furnished by the Parke & Lacy Company of this city, the Pacific Coast agents of the Lidgerwood Manufacturing Co.

ABOUT DOWNIEVILLE.—One of our subscribers writing from Downieville, Sierra county, under date of March 4th, says the only mail they have received for a long time was brought on men's backs or snowshoes, so that very little except letters has come through. The stage company are doing all in their power to open the road, and have lost several valuable horses from exhaustion in the attempt. "This is the most severe winter ever known here, the snow lying very deep all around. All business is at a standstill, the principal occupation being shoveling snow and hunting around for wood, which is very scarce."

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write and stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

THE Mohawk Canal & Improvement Company has incorporated to operate the Mohawk canal, situated in Mohawk valley, A. T., and to extend the same for irrigation purposes. Directors—R. H. McDonald, Frank V. McDonald, D. S. Dorn, R. J. Davis and Dr. John C. Spencer. Capital stock, \$1,000,000, all of which has been subscribed.

THE San Francisco Mint is now running under full pressure, and it is estimated that during the present month 600,000 silver dollars will be coined, or about the same amount as was turned out during February. The coinage of gold will not be neglected, and this month about \$2,000,000 worth of the precious metal will be turned into American money.

REDUCTION WORKS BURNED.—On Wednesday night the reduction works at Reno, Nev., were entirely destroyed by fire. The loss is about \$70,000, with \$10,000 insurance.

THE little town of Casey Hill, Penn., which was located over an abandoned coal mine, has been wrecked by caves, and a number of people were injured.

THE failure of Belloc Freres' bank in this city was brought about, it is said, by being mixed up in the French copper syndicate trouble.

—THE—
**PERFECTED
 DOUBLE
 Economic
 Quartz
 Mill.**

Attached to each Mill
 is an effective
**Automatic Ore
 Feeder.**

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with our shoes.

The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 9 to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an

IMPROVED ROCK BREAKER.

Power required for Mill and Rock Breaker, 6 H. P. SEND FOR CIRCULAR. Address

GRANGER'S ROLLER STAMP MILL
 Beats them all. Works dry ores. Makes even granulation. No dead work, hence minimum wear.
 A. P. GRANGER, Denver, Colo.

GRANGER'S DRY ORE SEPARATOR
 The very best. Uses no water. No freezing up. Saves hauling waste. Saves high percentage. Send for circulars.
 A. P. GRANGER, Denver, Colo.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery. Adapted to heads running from 20 up to 2,000 feet. From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 hp to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as of the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

GREAT REDUCTION!**BATTERY SCREENS.**

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates.

I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

**PERFORATED SHEET METAL**

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass. Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot Cut or burred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 16 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,

221 & 223 First St., San Francisco, Cal.

JOHN W. QUICK, Proprietor.

WINCHESTER HOUSE.

44 Third Street, - San Francisco, Cal.

This Fire proof Brick Building is centrally located, in the healthiest part of the city, only a half block from the Grand and Palace Hotels, and close to all Steamboat and Railroad Offices.

Laundry Free for the use of Families.

HOT AND COLD BATHS FREE.

Terms, Board and Room, \$1.00 per Day
And Upward.

Rooms with or without Board,
Free Coach to the House,
J. POOLEY.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, March 13, 1890.

Clear weather has brought in more assortment orders to jobbers, causing the principal business streets to have a more active, lively appearance. The various iron manufacturing industries continue to feel the effects of the iron-molders' strike. This is an unfortunate state of affairs, particularly at this season of the year, when orders for machinery and other iron work are generally placed; yet the surroundings are of such a nature that machine manufacturers cannot give in, for it would only mean many out of pocket and working for glory and paying for the privilege leads to bankruptcy.

The money market is reported to be generally easy, although in some quarters a stringency is reported. Now, with an early prospect of outdoor work soon becoming general throughout the State, and travel resumed to all points, it is claimed that the ease will be still more pronounced under a stimulus of more activity in all lines of trade combined with confidence in the outlook for the future.

MEXICAN DOLLARS—There was a freer export call the past week, with bankers paying 75% to 76 cents to meet their requirements. The steamer that left on last Tuesday for China took out \$487,043.

SILVER—The market the past week continued steady at 95 1/2 cents—the Mint quotation. Exporters, so far as could be ascertained, were not in the market, only the Mint buying. The offerings are still light, due partly to poor transportation facilities, but more largely to the light output of the mines on this coast. The Tuscarora district, which promised, on paper, to be a large producer, now appears to have "fizzled in the pan," if we are to judge by the rapid decline in the price of the mining stocks of that district. The Comstock mines' percentage of silver is decreasing and that of gold increasing. Con. Virginia's goes to gold 50 to 60 per cent, Overman from 60 to 70 per cent, and Crown Point from 42 1/2 to 47 1/2 per cent. The percentage of the other bullion producing mines we are not able to give. If the managers of all the Comstock mines would do the same as the Overman Mining Co. is doing, they would gain more friends among stock-dealers, besides making public information, which aids dealers in bullion to form a better idea regarding the situation. The Overman Company gives the car-sample assays in both gold and silver and the pulp assays in both gold and silver. This is a reform that speaks volumes in favor of the management of that mine, and, as said above, should be followed by other companies.

The silver market abroad and at the East has been declining. This is largely due to the close and uneasy money market abroad and also to a belief that this Congress will not come to the relief of the metal. In this latter conclusion we think they are mistaken. The House Committee is acting on Windom's bill, and it now looks as if the objectionable sections will be amended, which will make the bill perfectly satisfactory to bimetalists. One amendment was made to authorize free coinage when the price of silver bullion reaches par, or \$1 for 37 1/2 ounces of 1000 fine, and a section is added retaining the present legal tender quality of silver coin.

London cablegrams received to-day quote silver at 43 3/4 d, and New York telegrams quote that market at 94 1/2 cts. In our market the Mint was paying to-day 95 1/2 cts. The offerings still continue very light and confined to very small parcels.

QUICKSILVER—Receipts the past week aggregate 211 flasks, and the exports to flasks to Auckland. The home demand is reported to be increasing. The market is strong in sympathy with an advance abroad.

LIME—Receipts the past week aggregate 3465 bbls, and exports 150 bbls. to Honolulu. The consumption is gaining steadily with the call coming from more distant points.

BORAX—Receipts the past week aggregate 182 cts, and exports 676 cts, to Dunedin. The market continues strong under a free demand from the East, where supplies are reported as being light.

ANTIMONY—Our market continues strong. New York advices report supplies still scarce and the market high.

TIN—The market continues weak for plate, although at the close the tone appears to be steadier, due to stocks being better concentrated. The movement to form a syndicate to buy the salmon canneries on the Columbia river may have a bearing on the tin market. Pig tin is without any particular change to note. The market abroad and at the East has held fairly steady. Imports the past week were 200 bxs, plate from New York.

IRON—Imports the past week aggregate as follows: From South Shields 500 tons pig, New York 120 tons. The market is barely steady under few supplies. Eastern and European advices report an easer market with towards the close an improved feeling setting. The high price of fuel abroad is against any material decline in Europe. With us the labor situation is a disturbing element.

COKE—Imports the past week aggregate 1466 tons. The market is fairly steady.

COPPER—The market has shaded off until 14 1/2 cts. in our latest New York quotation. The decline is largely due to the very close and somewhat uneasy moving market abroad consequent upon the renewed call for gold from several quarters. The stock, so far as we can learn, in Europe and in North and South America is decreasing.

LEAD—The market abroad is reported to be in buyers' favor, while at the East it is in sellers' favor. The strength at the East is due to strong holding, rather than increase in the consumption.

COAL—Imports the past week aggregate as follows: Departure Bay 1517 tons, Seattle, 3993, Coos Bay 701, Cardiff 788, Tacoma 2340, Nanaimo 2300. Total, 11,638 tons. The market for Spot Greta and Sydney is slightly higher. The tone for steam coals is very strong with an advance looked for at an early day. For household coals the de-

mand is not quite so free, yet it is of sufficient moment to keep stocks well in hand. There are on the way from Newcastle, N. S. W., for this port 5 vessels, with 5 reported to be loading there. From Sydney there is one vessel on the way and one loading. For San Diego there are four vessels on the way and three loading. For San Pedro one vessel is loading. Of the vessels to arrive the cargoes have all been placed. For prompt shipment our quotations hold good, but for distant shipments lower quotations are obtainable.

Eastern Metal Markets.

By Telegraph.

NEW YORK, March 13, 1890.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday....	44 1/2	96	\$14 10	\$3 92 1/2	\$20 65
Friday.....	44 1/2	95 1/2	14 10	3 92 1/2	20 65
Saturday....	44 1/2	95 1/2	14 05	3 97 1/2	20 50

Mining Share Market.

The mining share market the past week was quite dull for the Comstocks up to Saturday, when there was an upward move with Ophir leading, which culminated on Monday morning. After Monday the market sagged, with short "ups" up to to-day (Thursday), when there was another small jump in the market under the leadership of Ophir. The Tuscaroras sold down heavily with only two small reactions. The break in these stocks was engineered by the pool, so as to get back at lower prices the stock sold out on the advance. It is generally claimed that they will go still lower before there is much in them. The points on the Comstocks are still bearish, although some look for better prices—not much, but some higher—after which there will be lower prices than at any time this year. In the Bodies, Quijotas and other outside stocks there has not been any trading to speak of.

The persons having charge of the work for pumping out the Gold Hill mines, met to-day to perfect plans.

From the Comstock mines our advices are still meagre. The official letter from Belcher reports that a drift has been started in the ledge on the 200-foot level. Our advices report this ledge lying about 500 feet west of former workings, and having a breadth of from 40 to 50 feet of fine looking quartz. It is considered very important. In this ledge numerous crosscuts will be run. The official letter from Crown Point does not report anything of particular interest. The bullion output of the mine in last month netted in coin nearly \$23,000, which is about \$5.50 a ton above milling and transportation charges. At this rate, with the mill running to full capacity, the company ought soon to have a surplus. Official advices from Con. Imperial reports that they are in ore on the 750-foot level. On this level they ran west to intercept the ore found above. From the Yellow Jacket mine information is hard to get, but it is hinted that something of importance can be expected within the next 30 or 60 days, from the drift being run west.

If the company would drift west on or about the 1200-foot level, practical miners say they will find a body of good to rich ore. Favorable information from Alpha and adjoining mines, it is said, is being kept back. In Potosi they are still making an upraise from the 950-foot level to intersect the large body (about 35 feet wide) of ore found on the 750-foot level. The upraise was at last account in \$30 ore. In Hale & Norcross extensive prospecting is being done. In his annual report the Superintendent does not mention the \$35 ore found on the 1250-foot level reported in his January 6th letter. Our advices from Ophir and Mexican are of a more favorable character, as they are from the Sierra Nevada. In the latter mine very important work is going on, which ought to make itself felt soon. Gould & Curry is being more closely watched by experienced miners. During the week several Eastern capitalists or their representatives arrived on the Comstock. What this denotes it is hard to say. A report is current that Consolidated Virginia will lay off about 100 men soon. So far as we can learn there is no truth in this report, for there is yet a large area of unexplored ground which the Superintendent in his last annual report spoke very highly of as promising valuable returns when thoroughly prospected.

From the Tuscaroras our advices are still favorable. They indicate that the Union mill will shut down soon for a clean-up, and also that some improvements will be made in the concentrators. The Commonwealth Company bought the North Belle Isle concentrators, and is working them in with their selected ore. From the Quijotas there is nothing new to report. Official advices from Bodie report more crosscuts started. Private advices continue to speak very hopefully of the prospects.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

CAPITAL PACKING Co., March 8th. Capital stock, \$60,000. Directors—Louis B. Parrott, Edgar A. Cohen, Edgar B. Carroll, W. F. Beck and Alfred H. Cohen.

CALIFORNIA REDWOOD LUMBER Co., March 11th. Capital stock, \$250,000. Directors—John M. Dennett, William G. Hawley, Frank F. Burton and Benton Griswold, of San Jose, Herbert Root, of Valley City, N. Dakota, and Michael J. C. Galvin, of Gualala, Cal.

EMPIRE QUARTZ M. Co., March 11th. Location, State of California. Capital stock, \$1,000,000. Directors—George D. Gray, Augustus Judson, J. Elliott Condict, Israel W. Knox and D. H. Jackson.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

"THE HANDY LISTS OF Technical Literature," by the National Publishing and Printing Co. of Milwaukee are exceedingly well arranged, and give the subject, author and publisher of technical and non-technical works on all sorts of subjects. Part II, just issued, covers military and naval science, navigation, sailing, ship-building, etc. With these lists there is no difficulty, even for non-professionals, in becoming informed on the literature of any given subject.

THE NIAGARA MILL AND MINE—The suits brought in Trinity and Shasta counties by W. T. Coleman and wife against Lavinia Sloss and L. L. Baker, as assignees of W. T. Coleman & Co., have been transferred to this county for trial. The Colemans ask for a decree that they hold certain mining property in trust for the Niagara Mill and Mining Company, and that the defendants have no interest in it.

TAKING TOOLS UNDERGROUND—Since the accident in the Yellow Jacket shaft that caused the death of Albert Ballard, superintendent of leading Comstock mines have resolved to enforce the rule to discharge any miner who is detected in taking tools underground when the men are being lowered at the time for changing shifts.

THERE has been a heavy explosion in the Morris colliery at Glamorganshire, Wales, and many miners were entombed.

DELINQUENT SALE NOTICE.

Gray Eagle Mining Company. Location of principal place of business, San Francisco, California. Location of Works, Placer Co., Cal.

NOTICE—There are delinquent upon the following described stock, on account of Assessment (No. 15) levied on the 21st day of January, 1890, the several amounts set opposite the names of the respective Shareholders, as follows:

And in accordance with law, and an order of the Board of Directors, made on the 21st day of January, 1890, so many shares of each parcel of such stock as may be necessary, will be sold at public Auction, at the office of the Company, Room 11, No. 303 California street, San Francisco, California, on MONDAY, THE SEVENTEENTH (17th) DAY OF MARCH, 1890, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.
Office, Room 11, No. 303 California street, San Francisco, California.

DIVIDEND NOTICE.

Office of the Pacific Borax, Salt and Soda Company, San Francisco, February 23, 1890.

At a meeting of the Board of Directors of the above-named Company, held this day, a Dividend (No. 20) of One Dollar (\$1.00) per share was declared, payable MONDAY, MARCH 10, 1890, at the office of the Company, No. 230 Montgomery Street, Rooms 11 and 12. Transfer Books close March 5, 1890, at 3 o'clock P. M.

ALTON H. CLOUGH, Secretary.

A MIDDLE-AGED MAN by the name of JOSEPH McLEARN, Miner, left Nova Scotia 17 years ago for California. His friends would be thankful to any person who could give any information concerning his whereabouts.

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1

SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Smelting; Cupellation; Weighing the Head; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations well bound in cloth, 1889. Price, \$1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ore; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Uranium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sublimar; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & Co., Publishers, No. 220 Market St., S. F.

Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hardy-gurds, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, postpaid. For sale by Dewey & Co., Publishers, 220 Market St., San Francisco.

COAL MINES OF THE WESTERN COAST.

A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for \$2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

"Sensible" Horse Power Hoisting Whims.

These Hoisting Whims are built entirely of Iron and Steel, mounted on a heavy base plate, and, consequently, are very durable and cannot be affected by extremes of either cold or heat or climatic influences.

The hoisting drum is completely under the control of the person in charge of the hoisting or lowering through the shaft of the mine. As the drum is entirely independent from the driving gears, the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases their capacity by avoiding the loss of time due to stopping and starting the horse.

They are very light and compact, and can be packed for transportation by mules. Their cost of erection is very slight; two men, in half a day, being able to put one in place, ready for work.

With each Whim, working drawings are furnished, showing in detail the proper construction of Gallows Frame and foundation for Hoisting Whim.

We carry in stock the following sizes:

No. 1.—Capacity with One Horse and Single Line, 800 pounds, 75 Feet per Minute.

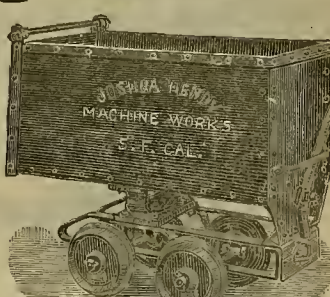

No. 2.—Capacity with One Horse and Single Line, 500 pounds, 125 Feet per Minute.

Weight of machine, 1200 pounds. Total shipping weight, including Sweep, Levers and Sheaves, 1400 pounds.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.

All Complete for \$150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "husted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make Two, Four and Eight Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

Come and see one at our works in operation, or send for circular.

TRANSPORTATION OF ORE BY HALLIDIE'S PATENT WIRE ROPEWAY.

HALLIDIE'S

PATENT WIRE ROPEWAY,

For the Economical and Rapid
Transportation of Ore
and other material.

Erected by Us During the Past Fourteen Years in Spans

200 TO 2,000 FEET.

Simple, Economical and Durable.

HAVE BEEN THOROUGHLY TESTED

In all Parts of the Country.

INVENTORS, TAKE NOTICE!

L. PETERSON, MODEL MAKER,

GEO. H. STRONG,

Dewey & Co.'s Scientific Press Patent Agency

ESTABLISHED
1860

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered by other agencies the information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not now. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

Smelter For Sale or Exchange.

One 50-ton, wrought iron, water-jacket Smelting Furnace (36"x60" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 23, Elkhorn, Montana.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

VOL. LX.—Number 12. DEWEY & CO., PUBLISHERS. SAN FRANCISCO, SATURDAY, MARCH 22, 1890. Three Dollars per Annum. Single Copies, 10 Cts.

PANORAMA FROM POINT SUBLIME IN THE GRAND CANYON OF THE COLORADO.

The Colorado Canyon.

The Grand Canyon of the Colorado is a great innovation on modern ideas of scenery, and in our conceptions of the grandeur, heauty and power of nature. It is not to be comprehended in a few days or weeks, but must be dwelt upon and studied, and the study must comprise the slow acquisition of the meaning and epirit of that marvelous scenery which oharacterizes the Plateau country, and of which the great chasm is the superlative manifestation.

The lover of nature, whose perceptions have been trained in the Alps, in Italy, Germany, or New England, in the Appalachians or Cordilleras, in Scotland or Colorado, would enter this strange region with a shock and dwell there for a time with a sense of oppression, and perhaps with horror. Whatever might be bold or striking would at first seem only grotesque. The oolors would be the very ones he had learned to shun as tawdry and bizarre. The tones and shades, modest and tender, subdued yet rich, in which his fancy had always taken special delight, would be the ones which are oonepionously absent.

But in time he would become conscious that outlines which at first seemed harsh, have grace and meaning; that forms which seemed grotesque, are full of dignity; that magni-

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—E.S.

"Gold Hath a Place Where They Fine It."

EDITORS PRESS:—Did it never strike you that there is a class of mining men who are constantly endeavoring to get it down "too fine?"—men who will at all times expend \$20 on a ton of \$10 rock that they may assure their employers that by their process "ores can be worked closer than by actual assay." These wise ones are usually sent out by Eastern capitalists. The new superintendent proceeds at once to revolutionize the whole process employed in the treatment of the ores from the mine. Huge buildings are erected, machinery fearfully and frightfully made is freighted in by the ton. At last the new process mill is started and dividends flow in like a steady stream? Well, not exactly! Somehow "there is a wheel too small" (or too large), and "some minor changes will have to be made." Again the wheels revolve, but the promised dividends fail to follow, and then the owners are duly notified that "owing to a change in the ore at water level a few changes will have to be made in the plan of the mill," and to the nearest foundry goes the intricate machinery to be replaced by other equally impractical. Occasionally the superintendent will, in despair, allow his millmen and mine foremen to have their way, and if they succeed will coolly patent their ideas in his own name and prove the old adage that "the wisdom of the superintendent is at times found in the foreman's hat."

The inexperienced superintendent imagines that all of his ideas are new and original. If he were to spend a year in visiting other mines and mining sections he would soon learn that the same processes have been tried and discarded years before. If there is one thing more than another that your fresh superintendent delights in, it is to assert that "by the present methods not one-half of the gold contents of the ores are saved," and that "the bunnling, old-fashioned stamps must go," but they don't, at least not in the way he would have them. That they are "going" into the mills of the largest and most successful mining operators is well known. While the Eastern stockholder may be deluded into believing that the mining operators of the day are running their ores through crude mills by unscientific processes, that they may be amused by hearing the stamps jingle, the California mine owner knows that these practical, hard-headed men, with their superintendents selected from among their own forces are the ones that make mining a success as against the miserable failures of the high-salaried, high-toned, scientific superintendent, who in nine cases out of ten proves himself to be a "theoretical success and a practical failure." "But you must admit that there could be no success without some theory," says my theoretical friend. Agreed, but how large is that "some"? Where shall it begin or end? I was discussing (and Sam cussing) this theory principle with Sam McMaster when he was manager of the Black Hills mines. Said McMaster, "The Freibergers had charge of the Comstock and made a failure of it. We California boys that worked our way up from the pick and shovel, took hold and made it pay. Theory may be all right, but it is a disease. Once a theorist, always a theorist. Our ores carry a small per cent of low-grade sulphurets that would cost more to save and treat than their value. I let them go down the tail race. Your theorist would waste good money saving them. What you can't save in the pan don't try to. Let some theorist spend other people's money doing it." No one ever questioned McMaster's ability, and I have never had occasion to question his judgment. E. H. SCHAEFFER, *Murphys, Cal.*

BUILDING STATISTICS—As an evidence of the advance made by the United States in the direction of providing its dwellers with suitable habitations, etc., it may be mentioned that the value of the building stone produced last year was estimated at \$25,500,000 and that bricks and tile to the amount of \$48,213,000 were made. These materials were stuck together with 49,087,000 barrels of lime, valued at \$24,513,000 and 6,253,000 barrels of American cement worth \$4,533,000. When to these figures is added the enormous amount expended for lumber, house hardware and labor in construction it will be seen that the people of the United States are paying a tidy sum every year for their homes, places of business, churches and other buildings.

DR. PARRY GONE.—Word comes from Davenport, Iowa, that Dr. C. C. Parry, the well-known botanist, died there of pneumonia on the 20th ult. He was a lifelong explorer and discoverer, having come to California in 1850 on the Mexican Boundary Survey. He was among the early investigators in the Rocky mountains, and a continuous laborer in botanical fields in Mexico and the United States. Beside his scientific attainments, his gentle, quiet ways had endeared him to a wide circle of friends, who will join in regretting that we shall no more see his kindly face and hear his pleasant greeting.

Need and Help.

There is perhaps no one duty that requires so much wisdom and delicate care as the distribution of our social charities. Human nature is kindly disposed, and where there is want and misery it is comparatively easy to awaken a warm glow of generous feeling. Money, food and clothing will be freely contributed, but how to distribute these things so as to alleviate poverty and yet not to encourage dependence is the question.

Take an illustration. There is no city so amply endowed with charitable organizations as London, and there is no city in the world so overrun with the most abject mendicancy. Now there is any relation between these two facts? Can it be that one is cause and the other effect? Does that old natural law as old as the granite hills and quite as immovable, the law of supply and demand, hold good here as in the business world? There can hardly be a doubt of it; double the charitable supplies and they will be called for; quadruple them and the demand will keep pace. Such we are told is the history of the social charities of London. On the other hand, Paris has a light-hearted, giddy population that loves to bask in the sunshine and enjoy the pleasures of the passing hour. Here we would naturally expect to find misery more extensive and poverty more degrading, but there is actually less want and of a milder kind. And yet Paris, in comparison with London, is very poorly equipped with benevolent and charitable associations.

Now, this does not show that charity is an evil. St. Paul made no mistake when he placed the crown upon charity and declared it as the noblest of virtues. All those who are in absolute need, the aged, the sick, the helpless and impotent certainly come within its sphere. No one gets so much real happiness, sweetness and fragrance out of life as he, who of his abundance, helps to assuage the sorrows and lighten the burdens of mankind. The benevolence that takes the shape of hospitals, asylums and other humane institutions, so far from being a burden should be considered a debt that society owes to its unfortunate ones. It is more of a blessing to society than a burden that it is stimulated to exercise the fraternal sentiment come into the consciousness of human brotherhood.

But, now while the beauty and loveliness of charity should not be dimmed, but rather made to shine with increasing luster, still the stubborn fact remains that every man is degraded and harmed who has the possibilities of independence within him and yet is encouraged to lean upon some one else. Mrs. James T. Field, who has had much to do with the charities of Boston, in her excellent little work entitled, "How to Help the Poor," says:

"To teach the poor how to use even the small share of goods and talents intrusted to them proves to be almost the only true help of a worldly sort which it is possible to give them. Other gifts, through the long ages tried and found wanting, we must have done with. Nearly a million of dollars, in public and private charities, have been given away in one year in Boston alone; and this large sum has brought, by way of return, a more fixed body of persons who live upon the expectation of public assistance, and whose degradation becomes daily deeper. The truth has been made clear to us that expenditure of money and goods alone does not alleviate poverty."

The author of the admirable work, "Natural Law in the Business World," says: "A sharp line of demarcation needs to be drawn between the poor man and a pauper. There is little necessary resemblance between poverty and pauperism. The worst calamity that can befall a poor man is to become pauperized. He who blindly scatters money in the name of charity is liable to do incalculable harm. On the other hand, he who teaches a man how to help himself, and raises him from the dependent class into that which is thrifty, does society and humanity a great favor." This is the noble work that the Citizens' Relief Committee of this city is just now busily engaged in. The long, cold, rainy winter closed up or greatly curtailed many avenues of employment, and the consequence is that a large number of very worthy poor with dependent families have been unable to find anything to do. To tide this class over a hard spell till business resumes its wonted channels, as it surely soon will do, and at the same time not to make San Francisco the rendezvous of tramps and vagrants, who have been pauperized by intemperance, vice, and crime, is the special work of this committee, and nobly has it been sustained by the liberality of our business men.

SHARKS IN THE ADRIATIC.—The construction of the Suez canal has made a free passage for the sharks from the Indian ocean to the Mediterranean sea. Previous to the construction of that work the only sharks observed in that sea were when some specially enterprising specimen of the fish followed the wake of some vessel around the Cape of Good Hope and through the Straits of Gibraltar.

THE WEALTH OF NATIONS.—The wealth of the United Kingdom of Great Britain is estimated at \$50,000,000,000. If this is correct, the average wealth of the English is largely in excess of that of any other nation. The three most wealthy nations per head of population, stand as follows: Great Britain, \$270; France, \$190; United States, \$160.

California Woolen Manufacturing.

Labor Commissioner J. J. Tobin has made an exhaustive investigation of the decay of wool manufacturing in California. He has found that the reasons why the industry has decayed are: (1) Competition with Europe and the East, (2) higher wages than paid elsewhere, (3) the cost of fuel, (4) the cost of water and (5) ruinous taxation. The report declares:

A little over a year ago we had in California 12 woolen-mills, running 76 carding machines, with a capital of from three to four millions of dollars. At present only half that number are running with a capacity of only 28 carding machines. This is less than half we had ten years ago. According to the United States census for 1880, California had nine woolen-mills, 60 sets of carding, 138 knitting and 16 sewing machines and 18,740 spindles. Capital invested, \$1,676,500. Number of employees, 835.

The Pioneer of San Francisco, by far the largest in the State, having 37 sets of carding machines, or half of the capacity of all our woolen-mills, has closed down, thereby throwing 700 employees out of work. The California Hosiery Co. at Oakland has closed its doors, and more than 100 hands have been thus deprived of their means of living.

The Los Angeles, Santa Rosa, Stockton and Woodland mills are not now running, and of course a large number of weavers, spinners, etc., are deprived of work. It becomes, therefore, a question of grave import as to what the causes are why woolen manufactures cannot thrive in California. To ascertain the facts, an investigation was set on foot by the bureau with the following results:

All the managers, superintendents, etc., of woolen-mills who were interviewed concurred in saying that over or excessive production of woolen goods was the first or primary cause. This is borne out by the statistics published relating to the woolen manufacture and consumption of last year. According to Bradstreet, there were no less than 61 failures of woolen manufacturing concerns during the year 1889, with assets amounting to \$5,651,000 and liabilities \$8,149,000. For the previous year (1888) there were 49 failures, with assets amounting to \$1,723,000 and liabilities to \$3,101,000. On the other hand, the quantity of woolen manufactured goods imported into the United States largely increased during these two years. According to a report issued from the Treasury Department, the average imports for ten months each year from 1884 to 1888 inclusive amounted to \$37,978,862, while in 1889 the amount rose to \$47,167,423.

Capacity Exceeding Demand.

The woolen-mills of California had a producing capacity far in excess of the local demand. One mill alone—the Pioneer—could more than supply the home market. Export trade to British America, Mexico, Central or South America is impossible under existing tariff systems. Unless, then, the woolen-mills of California could successfully compete with Eastern manufacturers, it is manifestly impossible to keep them all running. This they have learned by experience they cannot do. Our manufacturers in California have not only been unable to sell goods to Eastern buyers, but Eastern manufacturers have shipped goods to this market and undersold manufacturers here.

No wonder then that, laboring under all the disadvantages herein enumerated, woolen manufacture has not been a prosperous or even a paying industry in California. Still the time may not be far distant when there will be a market for all the goods that could be manufactured by every mill that was ever started in California. If one of the results of the Pan-American Congress should be the negotiation of reciprocity treaties, whereby our textile fabrics would be admitted free of duty to Mexico and the Central and South American republics, there would be work for every loom and spindle and sewing machine in all our factories.

British Columbia Mines.

The Hon. Mr. Robson has presented the annual report of the Minister of Mines for the year ending 31st December, 1889. It shows that since 1858 to the present time the estimated total yield of gold and silver amounted to \$52,236,753, the gold product of 1889 having been \$588,923, of which \$490,760 were known to have been exported by the banks, leaving some \$98,154 as having been carried away in private hands. The year's estimated yield of silver was \$47,873. The number of miners employed was 1929. Their average yearly earnings have reached \$330. The exporters of the gold referred to were the Bank of British Columbia, \$254,816; Garesche, Green & Co., \$188,580; and the Bank of British North America, \$47,873. The yield in the Cariboo district reached \$217,892, of which \$78,542 are credited to the division of Barkerville, \$41,150 to Lightning Creek, \$37,000 to Quesnelmouth, and \$61,000 to Kintley Creek. Caesar is down for \$54,910; Kootenay (western division), gold \$12,700, silver \$47,873; eastern division do, gold \$36,200; Lillooet, gold \$60,364; Yale, Coquoyos division, \$10,500, gold; Similkameen division, \$35,800; total for Yale, \$46,300.

The reports of the various commissioners deal at greater length with the respective sections, all of them intimating how greatly and

profitably it is possible to extend operations, among the necessary conditions being the reduction of the duty on mining machinery and the providence of improved transportation facilities. The Inspector of coal mines announces that during the year the following mines have been operated; their respective outputs have been: Nanaimo colliery, 223,870 tons, 18 cwt.; Wellington, 273,383 tons, 14 cwt.; East Wellington, 51,372 tons; Union colliery, 31,204 tons. The total output of the year was 579,730 tons, 12 cwt., the coal on hand on Jan. 1, 1889, having been 10,022 tons. The export of these collieries was 443,675 tons; home consumption, 124,574 tons; and on hand last January, 1890, a little over 22,504 tons. The statement shows the output and export of coal from 1887 to 1889:

	Output, Tons.	Export, Tons.
1887.....	413,360	334,830
1888.....	480,300	365,714
1889.....	579,830	413,675

The following statement shows the various sources with quantities of their supply of coal to the State of California from 1887:

	1887, Tons.	1888, Tons.	1889, Tons.
British Columbia.....	324,840	345,681	417,004
Australia.....	155,649	271,612	407,032
England and Wales.....	91,243	126,167	32,893
Scotland.....	12,615	10,680	12,727
Eastern States (anthracite, etc.).....	24,102	30,118	18,950
Puget Sound.....	569,710	568,918	372,614
Cosco Bay and Mt. Diablo.....	89,155	81,194	87,600
Japan.....		13,806	1,340

Totals.....1,217,428 1,448,208 1,351,057

Appended are the respective colliery returns, together with the list of questions submitted by the examiners in Nanaimo under the "Coal Mines Regulation Act."

Coast Industrial Notes.

THE pay-roll of the Olay Water Co. in San Diego is now \$3000 a month.

THE El Dorado flour-mills, Placerville, were burned March 31; loss \$15,000.

A FACTORY for making black lead and indigo blueing has been started in Victoria, B. C.

ROSS' IRON WORKS, Spokane Falls, was burned on the 9th inst. Loss, between \$50,000 and \$60,000.

THEY are quite successful in Stockton, San Joaquin county, with their natural gas wells. A flow has recently been found in the well on the State asylum grounds.

THE Tahoe Ice Co., gathered about 12,000 tons this year, which is about three-fourths of a crop. They have had much trouble with the snow. The ice crop along the Truckee river this season is only about half as much as usual.

THE Centralia (Wash.) News says that the Poget Mill Co. has such immense holdings of timber land that even at its present rate of cutting they will be using their own timber for the next 90 years. In Mason county alone they own 63,000 acres.

THE Salt Lake Tribune says that the Union Pacific railroad will be built into Southern California in less than two years, and that about 2000 engineers, bridge-builders, graders and track-layers will move from that city into Southern Nevada next month for the purpose of building the road.

ELECTRICIAN W. W. SLATER, at West Oakland, is at work on an electrical appliance on several passenger coaches at the pier, which, if successful, will be placed on the cars at West Oakland. The electrical contrivance is an arrangement which is intended to take the place of the bell cord running through the cars.

At the Inyo marble quarry the force is now engaged in getting out tiles for use in the Palace Hotel, San Francisco. The design is attractive, being a yellow center, 10x10 inches, bordered with ten-inch strips of the beautiful variegated moss-agate marble, and having white corners. The contract calls for \$7000 worth of marble.

KING UPTON and F. W. Stanley of Boston, W. R. Garrett of Mansfield, C., and J. A. Boyer of Chicago are said to have been here recently, and in the interest of Swift, the Chicago refrigerator car man and pork and beef packer. Their idea was to interest local capitalists in the enterprise and to establish a big industry along the bay shore.

It is reported that a corporation composed of Eastern capitalists and backed by \$5,000,000 capital has bonded 1400 acres of land at Point Pinole, Contra Costa Co., on the line of the Southern Pacific Railroad, a few miles above this city. An immense beef and pork-packing establishment will be started. J. K. Garretson, a Sioux City banker, is said to be on his way here to complete the preliminary arrangements.

A big financial institution which has no counterpart in this country is soon to be organized in New York. It will have for its principal object the capitalization of industrial enterprises. In fact, it is the intention to reproduce industrial corporations which have within 10 or 15 years opened an enormous field for investment in England. The new institution will have a capital of \$5,000,000, and it will be a joint English and American company, with headquarters in New York and London.

For the first time in the history of the Utsalady mill, Washington, the local demand for lumber is greater the supply which the mill is capacitated to cut, that is more than 100,000 feet per day, and the entire product is consumed on Fidalgo island. The Utsalady mill company has just opened a new yard on the west side of McNaught's ocean dock and Mr.

Owen has opened another lumber yard on the east side of the same dock. A new steam saw-mill is in operation adjoining the Owens lumber yard. Ames Bowman is building a steam saw-mill on the beach in front of his former residence. Several steam sawmills will soon be running on Fidalgo bay.

In the repairs to the Stearns' wharf at Santa Barbara, the piles put down are of eucalyptos trees grown in that city. About a year ago a few piles of this wood were used, and although it is yet too soon for positive results, from all appearances the piles have not been touched by the teredo and seemingly not injured by the water. The trees grow to a great height and are straight and strong, and if the teredo does not injure them, they will soon come into general use for wharf work.

The Alaska canneries have paid well in former seasons, and there were last year 36 of them in operation on the rivers where salmon were plentiful. Last year, however, some of them did well and paid handsome dividends, but the majority returned little profit, and a few hardly paid expenses. This season, so far as known, every cannery in Alaska will be operated, but the increased number will be

mond thinks that though white pine now commands here a larger price than redwood, it cannot remain long so. There is a large area of pine lands, he says, but the area of redwood is very small.

THE seal fishermen who fit out from this port for northern waters are likely to make money this year with any sort of catch. A year ago raw sealskins were freely offered in the market for \$6 apiece. Contracts with the sealers were made, it is said, for even less during the early part of 1889. At present, efforts are being made to contract for the season with the offer of \$10.50 a pelt for the prospective catch. Recently prices have advanced, until it is confidently believed that \$12 per skin will be reached before the season closes. This advance of 100 per cent in the price for sealskins in the past year, it is thought, will stimulate sealers to uncommon exertions, and for this reason that the coming season will be one of the greatest excitement among the hunters of the far north.

The projected extensions and branches of the California-street cable railroad in this city will give an increase of 30,000 lineal feet of track. The double-ended cars designed by the officials

the last \$6000. The water rights, ditches and reservoir were placed at \$45,500, and a dam which is to be constructed to cost \$10,000. The reservoir will have a capacity of 274,000,000 gallons. The ditches will be 19 miles in length and 250 inches of water are guaranteed. The appropriation made by the last Legislature for the purpose of establishing a State reformatory at Lone was \$160,000, so that nearly \$100,000 of the amount will remain for the construction and maintenance of the school after the land and the water rights are paid for.

A New Use for Granite.

A New Hampshire gentleman has brought out a new use for granite, which is described in an exchange as follows:

"We have been shown and have seen some preliminary tests made of a new composition made from finely crushed granite, which, when formed into any desired shape by molding and afterward burned and hardened, is to all appearances harder and as strong and durable as the solid stone itself, which it resembles closely in appearance. The composition is an inver-

by passing between iron rollers. It is not yet determined, of course, how fine or how varied a finish can be given to this material, nor has its durability been demonstrated beyond doubt."

A Kern County Garden.

In Kern county, a region of our State which is fast coming into prominence, natural conditions favor the growth of a great variety of ornamental as well as of economic plants. It is wonderful with what rapidity plantings advance providing soil and moisture conditions are favorable. The attractive engraving on this page gives the reader a glimpse at a plantation of ornamental trees and shrubs at Stockdale ranch, situated about 5½ miles southwest of Bakersfield.

The view includes only a small part of the ornamental plantings on the property. To the left, in the foreground, are pittosporum and bellotrope and to the right are cypress and arbor vitae, while on the extreme right is a beautiful collection of chrysanthemums. Scattered through the middle ground of the picture are roses, tube roses, dahlias, hollyhocks, car-

A COLLECTION OF ORNAMENTAL GROWTHS AT STOCKDALE RANCH IN KERN COUNTY.

small. Only two new canneries, it is thought, will be established. Last season 70 vessels were employed in the traffic, and in all 1500 sailors and fishermen were drawn from this port and transferred for the summer to northern waters. By the middle of April, it is said, this number will have disappeared from this port for at least six months.

SOME idea of the importance of the Alaska traffic can be gathered from the fact that fully 1500 sailors from this port alone are required in manning the fleet. In consequence, during the next month, there will be a considerable lessening of the oversupply of coasting sailors which always exists at this season of the year. No definite or accurate estimate of the value of the productions of Alaska has ever been made. It must amount to several millions of dollars annually. The sealing contract alone is estimated to bring the Government in \$1,000,000, to which must be added the value of the mining, cannery, fur, fish and other interests.

E. S. HAMMOND, a leading lumberman of Duluth, Minn., has all his life been engaged in lumbering in the pine forests of Wisconsin and Minnesota. He is now here for pleasure, but is taking a great deal of interest in the redwood, white pine and fir forests of the Pacific Coast. He has recently visited Alabama, Mississippi and other heavily timbered States of the South. He says the timber there is much inferior to that of the Pacific Coast, particularly so far as the pine is concerned. Mr. Ham-

mond of this company will be put on the new line, and cars of this pattern will run on the California-street road should it be necessary to add new rolling-stock to the present equipment. In addition to the cross-town road, the long-talked-of and much-needed extension of the old line will be made this summer. It will run from the present terminal the five blocks from Kearny to Davis street, and will be a great convenience to those having business at the wholesale houses in that vicinity and will give much better facilities for reaching the ferry. Plans for the new power-house are not finished, but will be ready the latter part of this or the early part of next month. It is known, however, that the structure will be of brick, three stories high, and will compare favorably with any similar building in the city. The new plant of machinery will be one of the finest in the country. All the latest improvements in cable-line machinery, including a 600 horse-power triple expansion engine, will be put in. Every part of the big engine and machinery will be purchased in San Francisco.

THE Prison Directors have decided by a unanimous vote to enter into a contract with B. Isaacs providing for the purchase of the lands, water rights, reservoir and ditches for the proposed reformatory at Lone, Amador county. The price agreed upon was \$61,500. The site covers 300 acres, 100 of which are given to the State, and the remaining 200 are purchased at \$30 an acre, making the price of

tion of a gentleman who does not yet wish to have his name made public. Steps are now being taken to have the process of manufacture patented.

"It is claimed by those who have looked into the matter that all kinds of ornaments for buildings, such as window caps or sills, cornices, friezes, and everything of this nature can be molded to accurate shapes and forms and manufactured by this process at one-tenth the cost of cutting the same out of the solid rock. These ornaments can also be vitrified so that they will take on a permanent gloss as fine as polished granite and at a mere fraction of its cost. Irregular surfaces may be glazed, of course, and many handsome designs made and used for building and other purposes at a very small cost, provided this material is found to be perfectly impervious and durable, as it is now believed to be.

"A hundred ways can easily be thought of in which this material can be used. The samples we have seen are made into paper weights, circular disks, medallions, etc. The composition follows closely the color and texture of the stone from which it is made. Roxbury granite would make a light-colored block, Quincy granite a darker one, and so on through the list. The material may be made from waste stones as well as any, and other kinds of stone besides granite could be used, we presume. The stone would be first crushed in a stone-crusher, and afterward more finely powdered

nations, zinnias, geraniums in great variety, also verbenas, marigolds, nasturtiums, etc. The palms in the picture are readily recognized.

In the background, in front of the tall trees, are hedges of Cherokee rose and pomegranate. In the center, midway between the palms, is the summer-house of honeysuckle and wistaria, and there are besides scores of flowers and shrubs which our enumeration does not include. New settlers in the upper San Joaquin valley can learn much of the adaptation of various plants to their region by a study of the gardens on Stockdale ranch.

NEW AND SMOKELESS FUEL-SAVING PROCESS. It is said that all the region round about Peoria, Ill., is in great excitement over the universal fuel process of destroying smoke and saving coal. Out of 90 tests it is claimed that an average of 40 per cent of the coal has been saved and all the smoke destroyed. The master mechanic of the Rock Island railroad reports after a week's trial that it is a net saving every day of between \$10 and \$12 for each and every engine on the road.

WATCH SPRINGS, piano strings and similar articles are being successfully tempered by electricity. The steel is wound on a spool, placed in an oil bath, and by the electric current kept at the exact degree of redness necessary for the temper required.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR GOLD MINE.—*Ledger*, March 16: There is little change to report at this mine. The miners are still on the strike. Not that the owners are desirous of having the men return to work at present, but the money matters between the employees and employers remain in an unsettled condition. Some of the men have been paid one month's wages; others hold out for the full amount due. It is understood that if the latter are not paid before the expiration of the 30 days allowed by law in which to file liens, they will proceed to secure themselves by liens. It is reported that a small force of men will be put to work Monday. Efforts are being made to get the rock-breaker and other heavy machinery hauled from Lone, and with a few days more fine weather it is thought that the balance of the mill machinery can be placed on the ground. We have just heard from undoubtedly reliable sources that sufficient money will be here from London to pay the men in full to-day (Saturday).

THE PLYMOUTH CON.—The Plymouth Con. Gold M. Co.'s report for the year ended Dec. 31, 1889, makes the following fiscal showing:

Gold bullion produced by the mines of this company for the year 1889.....	\$137,335 96
Operating expenses.....	63,747 61
Profit.....	\$43,588 35
Indebtedness Jan. 1, 1889.....	15,446 93

Surplus Jan. 1, 1890..... \$28,141 42
The productive detail by months was as follows:

	Bullion produced.
February.....	\$ 6,750 00
March.....	20,607 44
April.....	20,349 45
May.....	19,123 73
June.....	15,675 07
July.....	25,805 51
August.....	11,779 22
September (cleaning mill).....	14,771 27
October.....	1,039 73
November.....	1,406 93
December.....	

The sole management of the operations at the mine is now, as heretofore, under the care of Messrs. Hayward & Hobart, two of the directors of the company, whose large experience and well-known ability have produced the hitherto brilliant results. The company owns an extensive system of water-works. While this is not immediately available, it is believed that ultimately it will possess considerable value for irrigation and other purposes. About 35 men are now employed.

MISCELLANEOUS.—We are informed that the injunction suit of Wm. Doyle vs. Amador Gold Mine will probably be compromised. The company say they have no desire to intrude upon other persons' rights, and are desirous of settling the matters in dispute without the intervention of the courts. The Summit mine is to be placed with Eastern capitalists if possible. Mr. Stewart of Sutter Creek bonded it some time ago for \$6000, paying \$2000 down. The bond was about to expire when other parties stepped in and paid the balance due and thereby secured a title. The McKenzie mill at Irishtown resumed operations this week after several weeks' idleness on account of the weather.

Calaveras.

SHEEP RANCH.—Cor. Calaveras Prospect, March 15: Mining, ranching and all out-door work of every description has been retarded to a great extent this winter because of, but when spring comes, the balmy day will see much activity displayed. Everybody will be on the jump to do work that has been necessarily left undone. Roads are to be built, timber cut, wood hauled and prospecting done, and it is certain there will be no idle men in the neighborhood then.

El Dorado.

THE TAYLOR.—Cor. Georgetown Gazette, March 13: This mine has been worked more or less for the past 30 years, and has always been considered one of the best mines on this side of the county. Last fall this mine changed hands, and has since been running under the management of W. S. & E. W. Chapman of S. F. These gentlemen seem to be enterprising, go-ahead men, or they would have been discouraged months ago, as the weather has been against them since they first began work. Finding it impossible to get teams in this vicinity to haul lumber through the mud, they brought their own teams from Marysville to do the work, and although the roads have been very bad, they are hauling lumber almost every day. They have in course of erection a 20-stamp mill, with ample room for 20 more if they are needed. The building of the mill is in charge of Millwright James White of S. F. A Mr. Bath of Placerville is foreman of the underground work. In the absence of the superintendent, E. W. Chapman, W. E. Dennison has full charge of the works. About 40 men in all are now employed on the works, with a prospect of many more in the near future.

BEAR CREEK.—Cor. Georgetown Gazette, March 13: Since water is so plentiful a number of fine placer mines have been opened and are paying their lucky owners well. Work is being pushed forward as fast as possible on the Slate Mountain mines, showing the bonderers mean business. The Darling quartz mine stops for nothing.

Kern.

ORE.—Kern Co. Californian, March 15: R. Van Geem and John Dolka are crushing at the Hayes mill in Havilah a 14-ton lot from their mine in the Flying Dutchman district. Johns & Dignan are taking some rich gold quartz out of a claim in the Rand Hill, and will soon crush at the Hayes mill. Five miners are working on the Miller & Welch claim in Bald Eagle mountain near Havilah, and on Monday the pack-train commenced transporting the quartz to the Hayes mill. In Kernville the main shaft of the W. B. Walker mine has been sunk 80 feet within the last two months. The vein in the bottom is 26 inches wide. It has been widening gradually from the top. The footwall is hard and solid and the hanging is now beginning to make in

good shape. The ledge is almost entirely picking ground, though an occasional shot is put in.

Mariposa.

COULTERVILLE.—*News*, March 15: Several men have been set at work on the old Wagoner mine, which changed owners a short time ago. Some rich strikes have been made in pocket mines this season. Mark Parker is credited with taking out 64 ounces in two days. Miner Hilliard of Bull Creek reports favorably of the mining prospects on the north side of the river. People on the north side of the Merced are anxious to see work commenced on the roads and feel as keen an interest in the sale of the bonds as we do on the Mariposa side. Operations on the Bondurant mine will be resumed as soon as Supt. Zukoski returns. His arrival is expected within a few days. The mine was paying when it was closed down in December last. The suspension was temporary and was occasioned by a failure of the wood supply.

Nevada.

MILL.—*Tidings*, March 14: Lord & Co.'s new five-stamp mill on the Spanish mine near Nevada City is about completed. Some excellent ore has been opened up in the mine.

DERBEC.—The Derbec mine at Bloomfield is working with a medium-sized crew, good results attending. Cold weather has made water for washing the gravel somewhat scarce.

WATER.—Supt. Abadie tells us that the flow of seepage water into the North Star is diminishing at the rate of four or five inches daily, and that the pumps are handling the accumulation satisfactorily.

BRUNSWICK MINE.—*Grass Valley Union*, March 15: Major Fitzgerald has returned from San Francisco and says work on the Brunswick mine is to be resumed immediately. Such repairs as are necessary will be made to the machinery, and then the sinking of the new shaft will be continued. The mine is in good condition, and not much will be required in fitting it up for the resumption of work. The intention is to sink the shaft in order to get into more solid ground than was founded the adit level, when drifts will be opened. The reorganization of the company has been completed, and the stockholders are nearly all new men, residents of New York and San Francisco. Henry C. Murray, who was a prominent stockholder in the late organization, has disposed of his interest in the mine. The new company starts under favorable auspices, and intends to do considerable work in the way of development.

FROM WASHINGTON.—*Grass Valley Union*, March 16: Alf, Tregidgo and Geo. A. Hare, superintendents of the Washington and Yuba quartz mines, have reached Nevada City after breaking a trail through the snow from Washington, after being blockaded for several months. They report fresh meat as scarce up there.

BEN FRANKLIN MINE.—E. P. Huchins and J. P. Calkins, who have for some time been looking at quartz properties, left yesterday for home, expecting to return again during the spring months. It is reported that they have negotiated for the Ben Franklin mine, situated on the Osborne Hill range near the lower Colfax road, and that work upon it will be started up during the summer.

GOLD HILL MINE.—It is understood that the work of reopening the Gold Hill mine will be commenced at an early day. The power used will be steam, as there are in place two good engines for hoisting and pumping. A resort to the use of water-power will not be made until such time as the prospects of the mine will justify it.

COE.—*Grass Valley Union*, March 18: There is a probability of work on the Coe mine being started up in a short time, by parties who contemplate purchasing the property outright.

ALLISON RANCH.—There is nothing in a late published rumor of work being started on the Allison Ranch mine. The owners are not inclined to do so, and so far as is known there are no negotiations being made for the property.

WATER.—The troublesome water in the mines is being steadily disposed of, and if there is no renewal of heavy rains the drowned-out levels will be opened up again before a great while. The North Banner mine is again in full operation, and the mill is crushing ore.

WASHINGTON MINING DISTRICT.—Everything points to a lively and prosperous season in the Washington district. Mills will be put up and new mines opened, thereby giving employment to a large force of men. Washington bids fair to become the banner mining district of the county.

HARTERY.—The Larimer mill started yesterday to crush 100 loads of tribute rock from the Hartery mine. Supt. Fowler expects to be able to resume general underground work in a few days, as the water in the mine is under control.

Placer.

NEW MILL.—*Placer Herald*, March 15: The new 10-stamp mill at the Eclipse mine, it is expected, will be ready to start up by the 1st of April. It will be the most complete, substantial and convenient quartz mine in the county. They are down 250 feet on the incline and the rock at the bottom looks fine.

San Diego.

A BIG MINING DEAL.—*Julian Sentinel*, March 14: The sale of the seven mines known as the Gold King and Queen group, four miles from Julian, by Messrs. Meirose, Fielder & Hamilton, to the Cincinnati Belle M. and M. Co. for a good round figure, which was consummated last week, confirms what we have argued all along, that the present year would witness greater developments than the camp has ever known before. The Cincinnati Belle M. & M. Co. is not investing thousands upon thousands of dollars in this camp just for the fun of the thing, but are men who know a good thing when they see it. The camp is to be congratulated upon the acquisition of such enterprising men. That the mines will now be properly developed and worked goes without saying.

Shasta.

OLD DIGGINGS DISTRICT.—Cor. Shasta Free Press, March 12: Work in the Mammoth, under the management of J. M. Haskell, is going on with encouraging outlook. R. G. Hart of the Texas and Georgia mine has returned from Sacramento, having recovered from his late illness. Notwithstanding the bad weather, more mines are working than ever before. A few weeks ago an item appeared in the Free Press speaking about a rich strike in the Hart & Fleming mine. Just so. A month or two ago an account in the Free Press predicted a rich strike in this mine after extending the lower tunnel far enough

to connect with pay chute in upper works. The prediction has been verified and proves that Mr. Hart's theory was correct. It seems the deeper they go down in the Old Diggings the richer and stronger the ore chimneys. A still lower tunnel is being run, giving it another 100 feet of backs. This property is a valuable one and has paid for its own development as well as improvements, which reflects great credit on the management and gives it a record few mines can boast of.

A LIVE CAMP.—The Reid group of mines, consisting of seven locations, have been bonded from the other owners by H. S. Sherard and E. A. Reid. Mr. Sherard is an experienced mining man and was formerly with Haggin & Tevis. He is in charge and working a crew of six men in all, and is getting ready to make a test from the Old California mine. F. P. Satterlee of Shasta is putting the mill in running order and will have charge of the same. W. L. Sharp of Shasta is foreman of the mine.

Sierra.

THE BUTTE SADDLE MINE.—*Tribune*, March 7: A few days ago the miners who took a contract to run a 300-foot tunnel to tap the ledge at a greater depth at the above mine struck the ledge, being in only 170 feet. It is 14 inches wide, and prospects fully as good as on top. It was a great surprise to the contractors and to the company to reach it so soon, as they did not expect it before the 300 feet were run at least. It is believed that as they go ahead the vein will increase in richness and will reach the width that it is on top—about 30 feet. It was thought by some that the vein which was so large and stood out so prominent on top did not go down to any great depth, and consequently the owners were anxious to determine whether this was a fact or not, and so they let a contract last fall to run a tunnel in from the side of the mountain. Now that the ledge has been encountered at that depth, the owners feel satisfied that they will have one of the best mines in the county. The fact that it is so close to the famous Sierra Buttes makes almost every one believe that it is destined to be a good mine.

GOOD OUTLOOK.—*Sierra Tribune*, March 7: Everybody in Sierra City has gone at work now with a vim unequalled for years, and it will not be many weeks before the capitalists, who are so anxiously waiting for spring to open so as to come and develop mines, will be here. The Mountain, Chipp's, Marguerite, Cleveland, Treasure, Salinas and Mercer, San Luis, Northern Bell, Butte Saddle and several other new mines will soon be working, and Sierra City will be the liveliest mining town on the Pacific Coast this summer. We do not make this assertion from mere guesswork, but the mines are developed sufficiently for one to see that the majority of them are bound to become large gold-producers.

Trinity.

QUARTZ IN SOUTHERN TRINITY.—*Journal*, March 15: We mentioned last week the fact that several mineral locations had been made in the Long Ridge country. Prospecting for gold has been carried on in Southern Trinity for many years, and at times the prospectors have had good hopes. It is believed that good cinabar ore exists in the South Fork country, but it has not been much sought for. Mr. Henderson Taylor has a lode near the South Fork which shows free silver for about six feet deep, after which the silver disappears and gold takes its place. Mr. Taylor sent a box of the ore to T. E. Jones, in part of which the native silver can be seen by aid of a glass.

NEVADA.

Washos District.

SIERRA NEVADA.—*Virginia Enterprise*, March 15: On the 630 level a southwest drift is advanced 35 feet from the shaft station.

UNION CON.—On the 1465 level from the north lateral drift, opposite west crosscut No. 4, an east crosscut is advanced 144 feet, the formation changing from hard to soft porphyry.

MEXICAN.—On the 1465 level west crosscut No. 3, 100 feet south of No. 2, from the north drift from west crosscut No. 1, from the main north lateral drift, is extended 170 feet, continuing in a porphyry formation on which is somewhat harder.

OPHIR.—On the 1300 level from the end of the east crosscut from the shaft station a south drift is advanced 459 feet. From the end of this south drift a raise has been carried up 14 feet in quartz from which a few tons of milling ore has been saved.

CON. CALIFORNIA & VIRGINIA.—The 1300, 1435, 1500 and 1600 levels continue to yield the usual quantity of ore. On the 1650 level the northwest drift, now running in a northerly course, is extended 746 feet from the main west drift from the C. & C. shaft. From raise No. 8, 93 feet south from the northwest drift face, continue stopping ore, 30 feet below the connection of that raise with the 1500 level north drift from the Con. Va. shaft. From the raise above the north drift from the south widge, 60 feet down from the end of the south drift below this level, continue stopping ore 20 feet below the track floor. Shipped to the Morgan mill 1121 tons and 1260 pounds of ore, and to the Eureka, 1582 tons and 1560 pounds; battery sample assays showing an average value of \$27.88 per ton. Bullion valued at \$14,297.80 shipped to the Carson Mint. Bullion valued at \$16,700 now on band in assay office.

BEST & BELCHER.—On the 1000 level east crosscut No. 1 is extended 240 feet. Formation, hard porphyry.

GOULD & CURRY.—On the 400 level west crosscut No. 1 is extended 498 feet. Formation, hard porphyry.

NORTHWESTERN CON.—Shaft sunk down to 100 level, bottom in vein matter. Contract let for sinking to 150 level.

ANDES.—The 420 level west crosscut was extended 12 feet the past week. Face shows quartz giving low assays, with clay and porphyry.

NORTH GOULD & CURRY AND EAST BEST & BELCHER.—Usual progress made in advancing the west drift.

SAVAGE.—Shipped 455 tons of ore, showing an average value of \$24.48 by battery sample assays. Bullion on hand valued at \$9750. The February bullion yield of the mine was \$24,073.98. The 300 level south drift is advanced 84 feet from the top of the raise above the 400 level.

HALE & NORCROSS.—Shipped during the week 540 tons of ore showing an average value of \$19.50 per ton by battery sample assays. Extracting ore

from the raise above the 800 level north drift. The 1250 level east crosscut is showing fair-grade ore. The February bullion yield of the mine aggregated \$31,108.56. Bullion on hand valued at \$7333.

CHOLLAR.—The 750 level east crosscut continues in porphyry and the 850 level crosscut in clay and quartz. During the week extracted and crushed at Nevada mill 447 tons of ore, battery sample assays showing an average value of \$24 per ton.

ALPHA.—The 500 level west crosscut continues in porphyry, and the 600 level north drift in the same formation.

EXCHEQUER.—The 500 level north line crosscut is in 135 feet, porphyry showing in face.

CON. NEW YORK.—Top of raise above 800 level is in ore assaying from \$20 to \$25 per ton. The 700 level north drift from raise above 800 level is in fair-grade quartz.

SCORPION.—Advancing a southwest drift from the 630 level shaft station.

POTOSI.—The raise above the 930 level continues showing ore in the top assaying from \$30 to \$35 per ton. The 850 level east crosscut is in porphyry and quartz.

IMPERIAL.—The 300 level west crosscut No. 2 is in porphyry. The 500 level west crosscut is in porphyry. The lateral drift on that level is in quartz.

YELLOW JACKET.—During the week shipped 508 tons of ore, battery sample assays showing an average value of \$20.80 per ton.

CROWN POINT.—Shipped during the week 859 tons of ore, showing an average value of \$17.23 per ton by pulp assays. Are raising above the 160 level to connect with the Kentucky workings.

CONFIDENCE & CHALLENGE.—The 300 level joint west crosscut from the north drift has entered porphyry. The joint Imperial 800 level north drift is being reopened.

BELCHER.—The 850 level east crosscut is in porphyry and clay showing seams of quartz. The 850 level joint east crosscut is in porphyry, clay and quartz. Drifting south on the 200 level for the vein.

SILVER HILL.—The 260 level northeast crosscut from the northwest drift continues in porphyry. Repairs to the 160 level south drift are in progress.

SEG. BELCHER.—The 1000 level east crosscut is in soft porphyry and quartz. The south drift from crosscut No. 2 is in quartz assaying from \$10 to \$20 per ton.

JUSTICE.—During the week crushed 216 tons of ore, battery sample assays averaging \$27.50 per ton.

ALTA.—Crushed 315 tons of ore during the week, battery samples showing an average assay value of \$20 per ton.

OVERMAN.—Shipped 156 tons of ore during the week, showing an average value of \$19.76 per ton by battery sample assays, of which \$10.08 was gold. The raise above the northwest drift is in good ore.

UTAH.—On the 600 level the southeast drift from the shaft station is extended 1031 feet. Formation, hard porphyry.

OCCIDENTAL CON.—Continue to extract ore of good quality from the slopes on the 400 and 450 levels. The raise 100 feet south of No. 3 raise is up 64 feet, and the top is in quartz showing value.

NORTH OCCIDENTAL.—The 550 level joint east crosscut is extended 125 feet. The north drift from the line west crosscut is extended 29 feet and continues in hard quartz showing value.

Flowers District.

LITIGATION.—*Virginia Chronicle*, March 15: The owners of mining locations in Flowers district would have a prosperous year were it not for the suspension of operations through the injunction suit of the Lady Bryan company.

Jefferson District.

DEVELOPING.—*Belmont Courier*, March 12: Notwithstanding the inclement weather, the miners in Jefferson district are still developing their mines and some good ore is being taken out.

Morsy District.

LOOKING WELL.—*Belmont Courier*, March 12: The mines at Morey, Nye county, continue to look tiptop, and the indications are that a great deal of work will be performed on them this year. The ore is high grade and pays handsomely.

Tuscarora District.

NEVADA QUEEN.—*Times-Review*, March 14: North gangway from 600-foot level station has been extended 30 feet.

NORTH BELLE ISLE.—North gangway from the shaft, 600-foot level, has been extended 30 feet.

GRAND PRIZE.—500-foot level. The following extensions have been made: East drift from north crosscut 10 feet; north crosscut from the west north lateral drift, 17 feet; north crosscut from the east front vein, 15 feet without change.

NAVAJO.—South drift from the top of the winze from the 150-foot level extended 17 feet; the vein in the face has divided.

BELLE ISLE.—The crosscut from the 250-foot level, near the Navajo line, has been extended 23 feet. The face is getting harder and is showing faces of ore. The crosscut from the 350-foot level has been extended 19 feet, cutting into a vein in giving low assays. Face still in the vein.

DEL MONTE.—1st level: In north drift from No. 2 crosscut an upraise has been made a distance of 20 feet, showing good ore. North drift from joint crosscut advanced 15 feet, face of drift in low-grade ore. 2d level: Joint crosscut has been extended 6 feet, 3d level: Crosscut from north drift advanced 13 feet, looking favorable.

NORTH COMMONWEALTH.—1st level: South drift from joint crosscut extended 13 feet, exposing good ore, some of which is very rich. South drift from No. 1 upraise advanced 6 feet; face is showing chloride ore. No. 2 north drift from No. 1 east crosscut, advanced 19 feet; some little ore in the face. 2d joint crosscut advanced 6 feet, still cutting through seams of low-grade ore.

COMMONWEALTH.—1st level: East drift from No. 1 north drift extended 13 feet; total from turntable, 109 feet. Face of drift has 2 feet of ore. Stopes are being opened over this drift, and extended 350 feet, from which ore is now being extracted. 4th level: East crosscut from north gangway extended 11 feet; no material change. North drift from south gangway extended 24 feet, and started to crosscut the vein at this point. There are seams of high-grade ore mixed through the rock. Stopes on different levels are looking as well as at any time. Have yielded for the week 829 cars of ore; 525 tons worked at concentrating plant; assay, \$18 per ton. Bullion shipped, \$15.

40.14; bullion on hand, \$15,000. Mill and mine are running nicely.

ARIZONA.

THE OWL HEADS.—Tucson *Star*, March 12: Mr. Ham Light came in from the Owl Heads district yesterday. From him the *Star* learns: The new steam hoist has been completed and is now working. The new shaft is down 100 feet. After 100 feet more is reached a level will be run to connect with the winze now being sunk from the old workings. At the depth of 135 feet in the old workings a rich vein of ore has been struck which has been uncovered 250 feet in length. The ore will mill 80 ounces in silver. Three shifts are working in the shaft and three shifts in the winze. The mill is running steadily, new pans have been put in, and five more stamps will be added soon. The Owl Heads group consists of about 10 mining properties, all with good showings. The Owl Heads district is about 35 miles north of Tucson, and in its successful development Tucson will be the beneficiary from a mercantile standpoint.

COLORADO.

THE COWENHOVEN TUNNEL.—Aspen *Times*, March 11: The great Cowenhoven tunnel that is being driven through Smuggler mountain is making wonderful progress and last week the men came within a foot of breaking the record, making 74 feet. The record spoken of was made in January, when the tunnel was driven 75 feet in one week. The tunnel was then in a hard lime rock and is now in shale that is, perhaps, more difficult to work, as it is filled with arsenical pyrites that grind down the bits and change the gauge. While the shale is very hard, it is so brittle that the shots shatter it and make close timbering necessary. In driving the tunnel it is necessary to break a face of rock that averages about 10 feet square. It was thus necessary to break and move 7400 cubic feet of ground, or more than 500 tons, in making the week's run. The cost of this work was just about \$10 per foot. The company has the very best machinery obtainable and secures the most expert workmen that can be found. The name of the company that is prosecuting this great enterprise is The Cowenhoven M. Transportation and Drainage Tunnel Co., Mr. H. P. Cowenhoven is the president, and the work is under the supervision of D. W. Brunton.

MATCHLESS DEVELOPMENT.—Leadville *Herald-Democrat*, March 12: The development of the Matchless goes on each month without much change, as the vast bodies of ore which they have disclosed in that mine enable them to ship about what they please, and while the greater proportion of the ore mined and shipped from the mine at present is an argentiferous iron, there is a fair percentage of dry silicious ore being shipped, and the mine is being worked at a more than average profit. The entire shipments will probably amount to 35 tons per day, which could be made much greater did the management so desire. A great deal of development work is going forward, particularly in the lower levels.

GUSTON.—Denver *Republican*, March 15: The new Guston mine, of which but little is said, is one of the valuable Leadville properties and makes the following showing: Owing to a snow blockade on the railway, part of December's output of ore has not been shipped to the smelters, but the quantity shipped is 160 tons, and in stock 288 tons, together 440 tons. The estimated value of the ore is \$60,000, while the mine expenses amount to about \$10,000.

IDAHO.

PLACERS.—Elmore *Bulletin*, March 8: A few weeks ago George Wise and G. H. Gergecko sold to a Massachusetts man named S. J. Gordon 160 acres of placer ground for the round sum of \$30,000 cash down. These placers are located in Deadwood basin, about 90 miles northwest of Rocky Bar. There are numerous parties here who know Wise & Gergecko, and who also have often trodden the same ground in past days when they thought it worthless for mining purposes. Just as good placer diggings abound in Rocky Bar district, and the coming spring, with abundance of water, will be a propitious time for miners to pay them attention. Carl von Summerlatt, Wm. Richan, Tim Lynch and Gus Exner are making extensive preparations for working their placer claims in Red Warrior gulch. From present weather indications they will soon have abundance of water for ground-sluicing, and these gentlemen propose to have everything in readiness to take advantage of the limited water supply.

TO HYDRAULIC.—Boise *Statesman*, March 12: Negotiations have at last been completed and the contract has been let for the building of the longest and largest steel flume in this country. It will be built by a company of Spokane capitalists which has been incorporated under the name of Spokane Hydraulic M. Co., of which Mr. John W. Chapman is the president. The flume will be an immense steel pipe 4½ miles long, carrying water from the old California ditch at the head of Pritchard creek, in the Coeur d'Alene mining district above Murray, to the old wash gold diggings. The flume will be made of heavy steel pipe 22 inches in diameter, and will be about 4½ miles in length. This will give tremendous pressure, and reopen some of the old placer mines which are the richest in the Coeur d'Alenes. The work is to be done by little giants. The line of the flume will be down Pritchard creek from above Murray, by the old Dream gulch claims, once noted as the richest gold diggings in the district, to the old site of Eagle City, another deserted gold camp. All of these old wash diggings are on the line of the California ditch, an open box flume that follows all the windings of Pritchard creek and is over 12 miles long, but there is not sufficient pressure to do any heavy mining. Jesse Coulter, an old mining man, has tried for years to interest capitalists in some scheme to pipe the water down so that these diggings, which are known to be very rich, might be worked. It is due to his indefatigable efforts and to the enterprising spirit of some of Spokane's capitalists that the scheme has been carried to completion. After getting figures from all over the country, the contract was finally let to Holley, Mason, Marks & Co. of this city to furnish the steel and build the flume. It has been estimated that 700,000 pounds of steel pipe

will be used, and it will take 40 cars to bring it here. **THE RED ELEPHANT GROUP.**—Wood River *Times*, March 12: What seems to be an entirely separate and distinct vein was struck in the Red Elephant group of mines last Saturday, and the work since done upon it shows it to carry a width of 45 inches of solid galena ore. This new vein appears to run about 20 feet laterally from all other workings. The ore is of the usual high grade found in the group. While in Salt Lake City two weeks ago, Col. Bryan, the superintendent, selected a pumping and hoisting rig for his mines, which will be shipped with the concentrating mill as soon as the snow melts sufficiently to admit of the hauling of heavy loads up Red Elephant canyon. The hoist is of sufficient capacity to sink to a depth of 600 feet, and the mill will have a capacity of 40 tons per day. The capacity of the hoisting, pumping and concentrating machinery can, however, be nearly doubled at any time at comparatively slight expense.

MONTANA.

THE THRUSH.—Butte *Miner*, March 12: This property is situated southwest of the Pollock, and is a very promising prospect. It is owned by Butte parties and is now under lease to J. McNabb and others. So far the mine is only developed by a roof shaft, which was sunk some time ago. The present lessees have not yet cleared the shaft of the 35 feet of water that it contained when they took the lease, but it will be finished to-day.

THE POLLOCK.—The larger portion of the ground belonging to the Pollock company is being worked under lease to various persons, among whom are West Crowell and Chapman, who are working in the tunnel. A short distance farther west two other men are taking out free-milling ore that will average about 25 ounces in silver per ton. The lessees say they are only making wages now, but expect to do better in future.

THE EASTERN.—On the Eastern mine, northwest of the Jersey Blue, three shifts of men are engaged. The shaft is 200 feet deep and levels have been run from the 100 and 150-foot stations. Drifting went on the 200 is now in progress. Indications are now that a body of good ore will soon be encountered in this latter drift. The work is being done by the Eastern Mining Co., composed of six persons.

PICK AND DRILL.—The Hope mill near Phillipsburg is still idle and no one knows when it will resume operations. The amount of development work that will be done this spring and summer on the claims surrounding Butte will startle the oldest inhabitant. The bullion output of the Granite Mountain for the week ending Thursday was 47 bars containing 70,000 ounces of fine silver and 170 ounces of fine gold. The ore in the Cable mine is changing from gold to copper. The ore now runs about 40 per cent copper, and so far 1000 tons have been shipped for reduction. John Berry and M. Gerberg are figuring on building a mill for reducing the ore of the Simpson mine, a rich body which was struck by them a short time ago. The Simpson is located near Rumsey. Rumors of changes in the management of the Granite Mountain are flying thick and fast in and around Phillipsburg. One of the rumors is to the effect that Thomas Wier, superintendent, will soon resign, and that J. B. Risque of the Bi-Metallic will succeed him. The directors of the company, however, have not as yet verified this rumor.

NEW MEXICO.

FREIGHT IN ADVANCE.—Western *Liberal*, March 14: Several carloads of ore which the Standard Mutual Co. loaded for shipment this week were unloaded because the heartless railroad company demanded freight payment in advance or a responsible guarantee that it would be paid at the destination. Wm. B. Henry, a prominent New York journalist, arrived in town Sunday night. Mr. Henry is interested in the Johnny Bull mine at Stein's pass. He expects to do a large amount of development work on the property and probably will soon begin shipping ore from it. Fred W. Beardslee arrived in town this week from San Francisco, and has taken lease and bond on the Ocean Wave, a lead property owned by Bob Williams and situated between town and Pyramid. Mr. Beardslee will put on a pump and hoisting works and soon will be shipping ore from here. This is a fine property and has lain idle only because Bob did not have the capital to put on the necessary machinery to work it to advantage.

AT HILLSBORO.—Kingston *Shaft*, March 15: The mill of Thompson & Gales at Hillsboro runs steadily, and is dropping 20 stamps on ore. The force at the mines is kept recruited to the regular standard. The value of the ore is better than heretofore, and the owners are well satisfied with the production. The yellow bars of gold that are being turned out is the great index to the prosperity of Hillsboro, and invigorate the mining industry throughout that section. The recent discovery in the Brilliant gulch made by Mr. S. S. Call, is supposed to be the vein from which the rich ore found on the Solitaire came from. The vein at present is six feet wide between walls, and is well defined, all the gangue showing more or less mineral. The claim is known as the Sulphide, and was located by Messrs. Call & Marble on the 1st of January, and adjoins the Blackie claim.

OREGON.

BIG ALECK.—Bedrock *Democrat*, March 15: The Big Aleck mine will start up this morning after a stop of 10 days for repairs and the placing of new rolls, which will greatly increase the crushing capacity. The Groux amalgamator has been placed on the property and upward of 300 tons of ore will be run through every 24 hours.

UTAH.

PARK NOTES.—Record, March 15: The indications of greater activity in mining circles the coming summer are growing thick and fast. Many mining claim owners, prospectors and company concerns are already planning operations on large scale and as soon as the weather permits, mining matters will assume a livelier air than ever. Active development work will soon be resumed by Messrs. Hughes & Pogan on their promising group of claims in Woodside canyon. A tunnel has been driven

about 200 feet, and it is estimated that another 100 feet will tap the vein.

THE DRAIN TUNNELS.—The Ontario's big eastern drain tunnel is in about 3700 feet, almost a fourth of the distance. The work is progressing favorably. The Alliance Co.'s drain tunnel is in almost 5000 feet, two-thirds of the way. The formation of the country through which the tunnel runs is very encouraging, and it is different in character to that through which the Anchor tunnel ran. The mine is in splendid condition.

CAMP CROSSCUTS.—The Nevada-Northland leasers are ready to make another big shipment of ore as soon as they can get teams to do the hauling. In the last issue of the *Record* it was erroneously stated that a lot of Bolivia ore had been received at the Ontario mill to be tested by the Russell process, etc. The fact of the matter is that the test is to be made with a view of ascertaining which method of roasting, whether by the Stetefeldt furnace, the Howell or others, is best adapted to this South American ore, and the test has no connection with the Russell leaching process. The Stetefeldt furnace at the Ontario mill was selected in preference to mills in other places, while tests will be made at other furnaces elsewhere. After it is decided which furnace is the best, work will commence on a 100-stamp mill, to be erected by the Bolivia Mining Co., and this will be in addition to the 80-stamp already running. In other respects the item on this subject published last week was substantially correct.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MARCH 11, 1890.

- 432,106.—MACHINE FOR APPLYING HOSE COUPLINGS.—J. A. Angwin, Oakland, Cal.
423,130.—PNEUMATIC RAILWAY.—M. A. Clennam, S. F.
423,144.—BUTTER CRATE.—W. H. Ferguson, Seattle, Wash.
422,953.—SASH FASTENER.—D. O. Livermore, Los Gatos, Cal.
423,070.—DEVICE FOR LOADING SHIPS.—W. F. Mills, S. F.
421,066.—MUSIC STAND AND PORTFOLIO.—Viola Moore, S. F.
422,971.—BOOK INDEX AND CASING.—G. A. Pratt, Brownsville, Cal.
423,190.—ANT TRAP.—J. L. Stillman, Fresno, Cal.
423,001.—SASH FASTENER.—J. S. Turner, San Fernando, Cal.
423,197.—TORACCO PIPE.—C. D. Weldon, Mica, Wash.

The following brief list by telegraph, for March 18, will appear more complete on receipt of mail advice:

California.—James H. Cullen, Oakland, device for tapping sheet-metal vessels; Artemas A. Kent, assignor of one-half to J. J. Cherrie, San Jose, lawn sprinkler; Francis L. Matthews and D. J. Quinlan, Oakland, adjustable grooving head; Percy W. Rose, Los Angeles, metal railway tie; William C. Stile, deceased, S. F., ore-crushing mill.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DEVICE FOR LOADING SHIPS.—Warren F. Mills, S. F. No. 423,070. Dated March 11, 1890. This patent covers a novel construction of elevator and means for adjusting and driving it. The object of the invention is to provide a simple and effective elevator for the purpose of carrying goods up a ship's side, and of such a character as to be readily portable from one ship to another, adapted to be easily placed in position, to adjust itself to the rise and fall of the tide and the constant movement of the ship, and to be, as a whole, well adapted for the purpose intended.

PNEUMATIC RAILWAY.—Milton A. Clennam, S. F., assignor of one half to Chas. M. Prevear. No. 423,130. Dated March 11, 1890. This invention relates to certain improvements in pneumatic railways, and it consists essentially of a continuous tube and a novel continuous valve whereby communication may be continuously made and cut off between the tube and the connecting device which conveys the air from the tube to the car and the motor thereon.

MACHINE FOR APPLYING HOSE COUPLINGS.—James A. Angwin, Oakland. No. 423,100. Dated March 11, 1890. The object of this invention is to provide a simple and easily operated power-machine for applying the couplings to hose and securing them in their places. The machine, though applicable to any couplings, is especially intended for the coupling heads and nipples of the hose of railway air-brakes.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

Working Gold Ores Dry.

In later years there has been more or less interest manifested in the idea of working gold ores dry, and this is now beginning to have a good many advocates. There are two facts which give plausibility to the idea that better results can be obtained by dry than wet working; one, that the larger value of all gold quartz is in fine gold, and very fine at that; the other is, that water, moving down an inclined table, has an irresistible power over this fine gold, and it is quite reasonable to suppose more or less is carried off. Mr. A. B. Paul, who is a close investigator and has spent many years in practically testing this point, asserts that the loss will average over 50 per cent of the free gold product.

We are not prepared to dispute or affirm this declaration; we can only say that Mr. Paul has had a great many years experience in gold mining. There is another fact which presents itself to our mind, and this is, there is a general acknowledgment by our gold miners—even those working improved mills—that they do not get the returns they should from the ores. The same complaint comes from Australia and every other country where gold is mined. Dry working is considered by all odds to be better for the majority of silver ores, and very many mills are in operation reducing their ore dry. So if there are any better results, and enough extra to make dry working more profitable, why, greater profit will likely lead the work into that channel. Mr. Paul branches off and makes a very radical change by not only reducing the ore dry, but he amalgamates it dry, using mercury instead of water. As to his full system, we are not familiar; we only know it is a dry way.

In working gold ores dry, the question comes, Is not dry more expensive than wet working? Then how much more, and will the extra yield of gold give a profit over the extra expense? Then again comes the question of quantity that can be worked, cost of machinery, etc. There are a good many questions to be considered as between wet and dry working. As far as machinery goes for accomplishing a given quantity of work, if we have it not already, the mechanical skill of the time is equal to it. The question all rests on the difference in returns of the precious metals. The subject is an interesting one to our gold miners, and we will be pleased to have their views, pro and con.

A PROSPECTOR'S QUARTZ MILL.—James Day of Chico, Butte Co., Cal., makes a little mill with a patent "vacuum cylinder," a cut of which is shown in our advertising column. The machine can be operated by hand and will amalgamate both in the battery and on the plates. In its mechanical construction, it is like an ordinary California quartz battery. It is not a toy, but a small machine by which a miner can crush his own selected rock, and is calculated to crush 500 pounds per day of 12 hours. The mill weighs 225 pounds and costs \$75. With its accurate tests of rock can be made with less trouble than in an ordinary battery. It is adapted to be run by steam-power or by hand, and will be useful to assayers and samplers as well as miners.

ACADEMY OF SCIENCES.—At the last meeting of the California Academy of Sciences, 350 specimens of fish (100 species) were donated by C. H. Ohm. Dr. Harkness read a paper on the nomenclature of organic life. A branch of madrona from Mount Tamalpais was shown. The leaves, instead of being a deep green, were russet brown, due to the presence of a peculiar fungus growth known as *Rhytisma Arbuticola*. Three years ago this same growth made its appearance. A. Ehrlich presented some curious specimens of sclerotia found in Tulare county 3000 or 4000 feet above the sea level. Dr. Harkness said this vegetable is a puzzle, and exhibits under the microscope nothing but amorphous granules.

REWARDING AN INVENTOR.—By authority of an Act of Congress the Secretary of the Treasury has had prepared a gold medal, to be presented to Joseph Francois, the celebrated inventor of the life-oor. The medal has been struck and is now in the keeping of the Secretary of the Treasury. It possesses greater intrinsic value than either the medal voted to Cyrus W. Field for laying the Atlantic cable, or to General U. S. Grant for his services during the Civil War.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

GOVERNOR WATERMAN has refused to make a legal holiday of May 1st when the Eight-Hour League is to parade. He advises the league to donate the amount the parade would cost to the unemployed of San Francisco.

A BIO strike of excellent ore has just been made in the Little Nellie mine on Iron mountain, Shasta county.

MECHANICAL PROGRESS.

The Rapidly Growing Uses of Wire.

It is a circumstance which cannot have escaped notice that within the past few years the application of wire to different purposes has been widely extended, and there is now a large variety of uses for which it is successfully employed. So general, in fact, has its adoption become that the present has been characterized as the wire age—a term expressive enough to make comment almost unnecessary. This has, in a measure, arisen from the fact that makers of wire have been compelled to look carefully over wide areas for new outlets for the product of their mills. The advance in the efficiency of these mills, including especially the trains for rolling wire rods, within five or six years past, has been something surprising; in fact, it is a clear case of the adaptation of a high speed class of machinery to a line of work which has previously been done at considerably lower speed and at far greater cost for repairs of fixtures than later mills have yet required.

Disregarding some of the more common and well-known uses of wire, as, for example, in the field of applied electricity and the manufacture of wire rope, we find that a large and growing demand for it has sprung up in turning out barbed wire fencing, the manufacture of which, in a comparatively short space of time, has assumed commanding proportions. It is not difficult to realize that in this industry alone enormous quantities of wire are consumed. Wire door mats also have become generally popular, and have been the forerunners of woven wire matting for covering the floors of railroad passenger cars, and for various other purposes which will readily suggest themselves. Cleanliness, durability and economy are points which have been claimed for such matting with good reason, practical test having in every case given highly satisfactory results.

A somewhat unusual application of wire has been made in the construction of ordnance, of which the Longridge wire gun, in England, and the Woodbridge gun, in this country, are interesting examples. While the results of actual firing tests of guns of this type have not been in every way encouraging, the principle of their design has some things to commend it, and the idea may yet be carried out in a thoroughly successful manner. In the Woodbridge gun, a steel cylinder was surrounded by battered steel bars reaching the entire length, and around these was wrapped the wire while under tension.

Another use to which steel wire, in a braided or woven form has been applied, is its adaptation to helting for driving machinery. Some things may be said both for and against this use of the material. Metallic plates or bands have been used more or less for helting for many years, but however perfect their working may have proved in some cases, they are almost beyond hope of repair when trifling weakness begins to show itself. Braided or woven helts of wire could be more easily repaired, and if made of a comparatively firm wire they would in all probability hug a pulley over its entire width more perfectly than any band could when made of plates or sheets. It seems almost unnecessary to remark that the absolutely unyielding nature of the material of which the wire is made at the points of actual contact is wholly different from that of the slightly compressible leather or rubber covered canvas generally used. Hence, it could hardly be expected that equally favorable results should attend the use of the wire fabric until, as has been proposed, the yielding material is supplied in the shape of an elastic cover fitted to the pulley. This, however, introduces in an important manner the element of wear, and the pulley covering would, no doubt, be rapidly destroyed. The question of joint in such helts also has suggested difficulties, all of which, however, would seem to have been in the main overcome. At any rate, wire helts, we understand, are in successful use at Beaver Falls, Pa., driving machinery of various kinds.

As a means of turning out fire-proof stage scenery for theatrical use, wire has found another interesting application. The fire-proofing solutions and paints, hitherto employed in connection with the scenery in current use, have been found insufficient from the fact that they are unreliable, and further, are frequently objectionable because of their destructive action on the materials to which they are applied. As a substitute for these latter, therefore, the fabric employed for the familiar wire window screen suggested itself, being thin and flexible, almost like canvas, and admitting, when closely woven, of being decorated by scene painters in the ordinary way. The only objection which appears to have presented itself was in the circumstance that the wire gauze may be easily seen through. To overcome this, however, a special paste has been prepared, which is of light weight, and, when applied to the gauze, effectually closes up all the small openings. It, moreover, does not detract from the flexibility of the fabric, nor does it injuriously affect its fireproof character. Besides all this, we are told, the paste, when once applied, does not crack. Wire gauze scenery prepared in this way will, according to German report, shortly be used in an experimental way in the court theater at Munich.—*Railroad Gazette.*

THE WELDING OF IRON AND NICKEL.—Iron is now plated with nickel by pressure between rolls at a welding heat. The nickel is recovered from the clippings and shavings of the plates by the action of dilute sulphuric acid at a temperature of 55° C. The iron is dissolved and the nickel is obtained in the form of thin sheets as it was welded upon the iron. The operation is complete when the evolution of hydrogen ceases. Even fresh acid, at the same temperature, has practically no further effect. The separation of the two metals is apparently perfectly made; but a curious fact is noted. When the residual nickel is examined chemically, it is found to differ from its original composition, the amount of iron present being notably increased. For example, in a nickel containing originally only 0.9 per cent of iron, two per cent more was found when it was recovered from the plate cuttings; and even by a long-continued treatment with dilute acid, the iron could not be sensibly reduced. This peculiar behavior pointed to the possibility of actual chemical combination taking place between the metals, and that alloys of iron and nickel were produced in the welding, as it is well known that iron, with even a small proportion of nickel, resists the action of acids better than the pure metal.

WEAR OF TIRES.—Experiments which have been made recently on the Austrian state railroads, with wheel tires of Krupp's crucible cast-steel and Martin steel, have yielded interesting results. For the purpose of the trials, three wheels on one side of a locomotive were furnished with tires of one kind of steel, and those on the other side with tires of the second kind. The profiles, to start with, were, of course, exactly alike. After two years' running, measurements of the profiles showed that the Krupp steel tires had worn down on an average 10 millimetres (about 0.4 in.) while the Martin steel tires had worn down 14 millimetres (about 0.56 in.). Including the weight of the metal removed in again turning down the tires the normal profile, the weight lost, due to wear, was 40.4 kilograms (88.85 lb.) in the case of Krupp tires, and 56.4 kilograms (124.08 lb.) in the case of those of Martin steel.—*Toronto Hardware.*

A NEW MACHINE FOR CUTTING IRON.—A machine for cutting up round or flat iron and steel, and much needed in mill work, has been invented, says the *Rockville, Conn., Journal*. It cuts round iron or steel from one-quarter to one-half inch and flat up to quarter inch, as easy as one cuts a piece of card with pocket scissors. There is an opening for each size of round, while a drawing shear cuts the flat. There are several unique movements and points in connection with the machine which must be seen to be appreciated, especially the return of the blade after a cut has been made, and which is made without any springs to offer any resistance to the cutting motion. A great advantage and saving of time results from the finished manner in which the work is left after the cutting.

COMPOUND LOCOMOTIVES.—The Chicago, Burlington & Quincy mechanical department have designed a new compound locomotive which they expect to build soon. The high-pressure cylinder will be 19 inches and the low-pressure cylinder 29 inches diameter. They intend using a cast-steel piston in the low-pressure cylinder to keep down the weight. The valves will have a travel of six inches. The high-pressure valve will have 1-16 inch outside lap and the low-pressure valve 15-16 inch. Both valves will have 3/4-inch inside lap. In full gear the lead of the high-pressure valve will be 3/4-inch and that of the low-pressure 3-16 inch.—*National Car Builder.*

COOLING STEEL TO SOFTEN IT.—To beat a piece of steel to a low red heat, and lay it away to cool for a day or two, may be all well enough when it is to be made soft by the operation, provided it has been allowed to cool gradually all the while, but the chances are that it has cooled more in the first five minutes than all the rest of the time combined. Get a good non-conducting material for this purpose and be sure and have it dry and hot.—*Ec.*

CHROMIUM STEEL FOR ARMOR PLATES.—Great interest has been excited in both English and French naval circles by a new invention in armor plates. The new armor is said to be an alloy of steel with chromium and an unknown substance, and has a tenacity equal to wrought iron combined with the hardness of best tempered steel.

NEW PROCESS FOR WORKING STEEL.—Negotiations are in progress for the formation of a company to work a new process of seamless pressed steel, invented by Messrs. Heelingham and Bywater, engineers in the employ of Mr. Samson Fox of Leeds, Eng.

GERMAN MAKERS assert that their steel engraving tools possess the hardness of a diamond. The method employed is said to be to heat the tools to a white heat, plunge repeatedly into sealing wax until cold, and then just touch with oil of turpentine.

The courts decide that the original Lick trustees must build and put into operation the Lick School of Mechanic Arts, for which \$540,000 was left by James Lick.

SCIENTIFIC PROGRESS.

Extraction of Oxygen from the Atmosphere.

One of the industries now followed in London, and certainly a novel and remarkable one, even for this age, is that of separating and storing oxygen from the atmosphere. This interesting process has a unique application in the maturing of spirits and improving the quality of beer, and, though this is far from being the only application which is made of pure oxygen, it is one which, for various reasons, has excited most attention, especially in that department of trade, on account of its financial bearings. It is claimed that the oxygen, in its contact with spirits, actually accomplishes in a few days what, if left to the natural and usual process, requires a period of from three to five years. The oxygen, it is said, gets rid of the fuel oil quickly, thus relieving the liquid of its most injurious property, and not only this, but a maturer effect is also produced on beer by admixture with oxygen.

About thirty years ago Boussingault discovered that the monoxide of barium, at a temperature of 1000 deg. F., would readily absorb oxygen from the atmosphere, forming a dioxide, and that at the higher temperature of 1700 deg. it would be given off again. The only obstacle to the use of barium as an economical means of obtaining oxygen arose from the fact that the barium took soon lost its power of recovery. To the brothers Brin the world is indebted for the ability to overcome this difficulty, and within the last two years the Brin Oxygen Co., of London, has become a reliable and commercial success. Barium oxide is a mineral substance closely resembling lime in its properties, and occurs most commonly in lead districts, as a sulphate or carbonate. A lump of barium monoxide might readily be taken for pumice stone, but in action it is very different. When placed in water it slacks with greater rapidity than lime, and gives off much more heat.

Extermination of American Animals.

We gave last week an article under the above head, showing that a large number of American animals are rapidly disappearing before "the man with the gun," and from inhuman fashions that now prevail for dress ornamentation. A writer in a late number of the *Chautauquan* tells us how this work of destruction may be curtailed. He suggests that a tax be levied upon all persons found with fresh skins in their possession; which we suggest be carried further, and that the humane societies excite popular interest in favor of instituting a law prohibiting skin or fur dealing; also the dealing in and wearing of millinery birds, to which may be added the innumerable uses to which portions of animals and birds are put for decorative purposes, and sold so cheaply as to still further show the low estimate placed on life and blood.

The influence for evil increases with the cheapening of animal wares, as we readily see, for they are then brought within the reach of all, carrying with them the demoralizing and benumbing influence associated with the killing of these—God's creatures.

When we look through our wardrobes we are bewildered as to what will take the place of the portions of animals with which we have bepatched ourselves; but more appalled are we in solving the dizzy problem of home decorations, where the evidences of wholesale slaughter of the unoffending creatures stare us in the face at every turn. Even the bible is clothed in the skin of an animal. Verily, we can not judge of contents by exteriors; and I doubt not that if the bible could speak it would tell us how hateful and uncomfortable it feels in other's clothes. Do I startle you into discomfort? Well, misery likes company.

"There is no royal road to knowledge." While getting our eyes open has enabled us to see this mire of carnage through which we wade, it also enables us to see the lighted path beyond and the upward direction of our intelligence to devising means for supplying substitutes for the great variety of birds and animals which have been forced to find a final resting place piecemeal among the civilized. (?)

ABOUT FISH AS FOOD.—Fish, especially salmon in tins, are something colored with annatto. As the eye and the palate have a very intimate relation, it is frequently the case that vegetable or other harmless coloring matter can be advantageously used in food preparations, just as it is in the manufacture of confectionery. It is better, however, to eat our food with the color which nature gives it. There is a very interesting fact connected with the drum-fish, which was recently reported to the Philadelphia Academy of Sciences by Dr. Leidy, of that city. He said that "during a visit to Charleston, S. C., before the late war, there were served at an evening entertainment, among other viands, some nicely browned slices of the drum fish, *pogonias chromis*. A friend, informing him that some proportions were more gelatinous and delicate than others, had helped him to what he supposed was one of such. On cutting into it he had observed embedded in the flesh a soft mass, which appeared of enigmatical character. The following day he procured

from the market a drum-fish, on dissection of which he found embedded in the tail several egg-shaped masses, about three inches long and less than an inch thick, which proved to be a large coiled worm an *acanthorhynchus reptans*. This it was that gave delicacy to the dainty, and in this instance the parasite seemed to enhance the excellence of the food."

THE CLOUDS AT NIGHT.—The observations made during night ascensions, or those which were continued into the night, in temperatures at different heights, gave results different from the theories previously held on the subject. An increase of the temperature with the night was noticed after sunset. The rate of decline of temperature with elevation, when near the earth, was subject to variation as the sky was clear or cloudy. From an elevation of three miles cirrus clouds were seen apparently as far above the observers as they seem when viewed from the earth, and that under such conditions that it was hard to believe their presence was due to moisture. The audibility of sounds from the earth depended considerably on the amount of moisture in the atmosphere. The noise of a railway train could be heard in clouds at four miles high, but not when the clouds were far below. The discharge of a gun was heard 10,000 feet; the barking of a dog at two miles, but the shouting of a multitude at not more than 400 feet. Many differences in the results of observations were supposed to depend upon atmospheric conditions, while these vary with the time of day and the season of the year, so that a great many observations would be required to determine the true laws. Having followed up one of the observations recorded above with a captive balloon, and by other means, Mr. Glaisher declared to the Meteorological Society in 1870 that the theory that the temperature is always lower at higher elevations is not true.

A SUBSTITUTE FOR OAK BARK IN TANNING.—In a recent United States consular report, Mr. Merry describes "a vegetable product which will become a ready and perfect substitute for the rapidly vanishing oak of our own country." This is the Australian wattle, which belongs to the widespread family of acacias, and which is cultivated extensively in New South Wales and Victoria, where it lends a charm to the scenery both by its fragrant blossoms and its exquisite foliage. The two varieties most cultivated are the black and the broad-leaved wattle, and both can be grown in an exceedingly dry climate and a poor soil. The black wattle produces a large amount of tannic acid. Its value for tanning will be understood when it is mentioned that hides can be readily tanned in a bath of liquor made from the black wattle in 47 days, whereas, in liquor made from the bark of the Santa Cruz oak, the best known in the Pacific States, the time required is 75 to 80 days. The black wattle contains 30 to 35 per cent of tannic acid, the broad-leaved wattle 26 to 28, Santa Cruz 16 to 18, and other kinds of oak less still. Although the broad-leaved wattle has less acid, it has certain advantages over the black variety. It is a larger and handsomer tree, and can withstand a greater amount of frost.

THE CAUSE OF SUBWAY EXPLOSIONS.—Numerous explosions from underground electric wires all over the world have generally been attributed to gas in the mains or the decaying of organic or vegetable matter, and in either case explosions being effected by the arcs formed in conduits by imperfect insulation and the water surrounding the electric wires. It is well known that the detonation of explosives in many instances depends on the means used in igniting; an explosion caused by a spark produced by gunpowder or a flame. Prof. George Forbes, F. R. S., has made some pertinent suggestions as to whether these explosions have not been due to oxygen and hydrogen formed by the decomposition of water which is generally around the wires, giving opportunity for arcs to be formed. Hydrogen and oxygen, in the gaseous state, form one of the highest explosives known.

INGENIOUS CLOCK.—Aside from being a regular timepiece and daily calendar, it is also provided with a system of keys making a double circuit around the outside of the clock, the first one to denote the hour and minute, and the other the day of the month. The object is to furnish thereby a regulator for business appointments. For instance, if a man had an appointment at 9:10 o'clock in the morning, he would turn the indicator to that time as well as another to Dec. 1. At the minute exactly that morning an alarm would be turned in, and would continue to ring until stopped. The clock is the first of its kind in America, and has been viewed with considerable interest by the jewelry trade.

THE PHONOGRAPH AS A TEACHER.—The phonograph is expected to prove a valuable aid in the study of languages. The pupil can take home a piece of tin-foil on which is recorded his teacher's correct accent, and practice with it in his own room as much as he pleases.

PROF. ORTON concludes that the natural gas supply of Ohio and Indiana is not only not inexhaustible, but that it will probably be exhausted in nine years.

GOOD HEALTH.

Health of the State.

The report of the State Board of Health for February gives encouragement of an improved condition of the general state of health throughout the State since the January report. Returns have been received from 103 localities having an estimated population of 822,950, showing a decadence at the rate of 17.28 per annum, while the returns for January gave an annual death rate of 20.64. Diseases of the respiratory organs, however, still occupy the most prominent place among the causes of death.

Consumption heads the list with 249 deaths, a decrease of 21 from January.

Pneumonia also presents the large mortality of 160 deaths. Nevertheless it is a decrease of 68 from last report.

Bronchitis is credited with 33 decedents. This is also a reduction of 19 from last report, although it is much in excess of the usual mortality recorded from this disease. Congestion of the lungs was fatal to 12 persons, about half the mortality of previous month. Whooping-cough caused six deaths, which indicates an increase in the disease. Diphtheria and croup, collectively, were fatal in 18 instances, a marked decrease from fatality in January, when 40 deaths were registered from these diseases. Diarrhea and dysentery caused but five deaths, an unusually small rate. Cancer, as usual, has caused a large proportion of deaths, 22.

The reports from localities generally throughout the State indicated very well marked subside in the frequency and fatality of diseases of respiratory organs. The notes of a number of correspondents convey the impression that in a majority of the districts heard from, the condition of the public health was much more satisfactory than was to be expected, considering the extremely inclement weather that prevailed throughout the month. The decrease in the prevalence of disorders of the bowels was quite noticeable, especially cholera infantum, which is hardly mentioned.

The absence from our reports of typhoid fever as a prevailing disease is remarkable, and in some degree confirmatory of the observations of authorities upon this subject, that a copious and continuous rainfall so flushes and washes out the impurities of the soil and the receptacles of filth that typhoid fever becomes perceptibly lessened in its frequency, if not entirely absent, from localities in which it before was prevalent.

Care is being taken to prevent the smallpox from crossing the border from Las Vegas, Mexico, where it has been for some time prevalent. Recommendation is made that care should be taken in the way of general vaccination, especially in the schools, to prevent the possibility of its again becoming prevalent in this State.

Influenza is rapidly abating; although mentioned in nearly all of our reports as still present in the State, it is characterized by its mild form and general absence of fatality. Probably the next report will convey the intelligence of its total disappearance.

The Adulteration of Confectionery.

Much has been said of late in regard to the adulteration of confectionery. One of our city dailies recently said: "The adulteration of candy is a topic which should be taken up by the State governments and by Congress. Statistics show that every year witnesses a spread of the practice which cannot but result in serious injury to the health of children. Terra alba, or white earth, is used exclusively for adulterating candies, yet no less than 6000 tons of this substance were recently imported through New York. Lozenges made entirely of this earth are dipped in syrups flavored with peppermint and other essences and then sold as genuine sugar lozenges. When it is known that terra alba is a mineral insoluble by the gastric juices, the extent of the evil of this adulteration may be understood. It means grave danger of incurable disease to thousands of young children."

A correspondent of the *Scientific American*, in allusion to the above, which also appeared in that journal, says that the importation of the 6000 tons of terra alba occurred some five or six years ago, before the organization of the National Confectioners' Association. It seems to be admitted that terra alba and perhaps other adulterations were used to some extent previous to the organization of that association; but it is denied that adulterations have been used since. One of the leading objects of the association is to prevent such frauds. As an evidence of this, the correspondent above alluded to says that the association "offers a reward of \$100 for evidence that will enable it to convict any person of adulterating confectionery with poisonous or injurious substances, the association assuming all the cost of prosecuting."

In addition to the above, the correspondent, who is the editor of the *New York Confectioner*, offers to duplicate the reward himself. The above assurance that such adulterations have practically ceased, through the efforts of the leading manufacturers themselves, should be very gratifying to all.

MADE IT PAY.—It is said that Dr. Knorr of Germany, the discoverer of antipyrine, the

great grip remedy, has made considerably over a million of dollars by the winter's epidemic. The medicine sells at \$1.40 an ounce, and Dr. Knorr gets a royalty of about 60 cents on every ounce sold.

DANDRUFF.—The application of chloral hydrate in solution of five grains to the ounce of water is said to clear the head of dandruff and prevent falling of the hair from the latter cause.

USEFUL INFORMATION.

A NEW AND CHEAP BINDING TWINE.—The need always brings the inventor. The high cost of binding twine, brought about by the corner made by speculators in twine, has resulted in the invention of a practical and cheap substitute, which is practically out of reach of speculators. An Iowa inventor has come to the front with this much needed substitute. The new twine is made of dried grass. He has also invented a machine for making it. When in Chicago a few days since he exhibited a large bundle of such twine, the thread of which is about one-eighth inch diameter, and as flexible and as easily handled as the same size of hemp twine. It will sustain 200 pounds of tension. This twine may be made of upland prairie grass, though the best is of coarse marsh grass. The machine for making it is simple, and can be constructed so as to be within the reach of every farmer. A boy can make about 800 yards of twine an hour. As compared with the present twines used for binding it costs much less to make and from 5 to 7 cents an acre will be the cost of its use. The twine consists of this dried grass or hay twisted tightly and firmly held together by cotton thread. It has also been woven into bagging for shipping cotton. For this purpose it has proved admirable, being strong and very durable. It is about one-third the cost of jute, and is said to be much more serviceable.

FAILURE OF "SMOKELESS POWDER."—The French have succeeded in making a powder that is nearly smokeless. The manufacture is a secret owned by the Government. It is considered of great value in war, and other European nations have produced something of a similar nature which is even more smokeless than the French article. Italy built a factory to manufacture it in the interest of the Triple Alliance of Germany, England and Italy. On trial it has proven a success so long as the powder is kept warm; but recently when the cartridges were tried in cold weather they most unexpectedly failed to explode. Repeated trials have shown that the powder has no value except in summer weather. Hence, it is claimed that the invention is a failure. Great efforts have been made to secure a cartridge of the French make for analysis, but hitherto without success. Every cartridge is more carefully guarded than a mint of gold. Two French soldiers are now serving life sentences in prison for trying to steal a single cartridge to sell to Germany. A cartridge is a little thing and doesn't cost much, but the secret those cartridges contain may mean victory for France some day, and the French Government will go to almost any extreme to keep rival nations from knowing it.

JAPANESE CLOCKS.—The Dublin Science and Art Department has recently purchased several Japanese clocks, which differ in many respects, but all record time without the usual hand rotating about an axis. The scale of time is arranged as on a thermometer, and a pointer attached to a weight projects from a slit in the scale, and, travelling down it, thus points out the time. We understand that such clocks were seen in Japan 30 years ago, but that they are now generally superseded by clocks of European pattern.

A SILKEN FIBER FROM THE BANANA PLANT.—Attention is being again directed to the utilizing of the banana. From the stalk and leaf of this plant, it is stated, a beautiful silken fiber can be obtained, which, when manufactured into dress goods, closely resembles Irish poplin. When suitable machinery for decorating it is found, it is thought this fiber will command large commercial attention for the manufacture of textile goods, as well as for paper and other purposes.

PETROLEUM BRICKS.—The French professor of chemistry, De Millefleurs, recently exhibited before a meeting of Parisian scientists several bricks of petroleum, which he has discovered how to solidify by an original process. The petroleum bricks were hard enough to be handled without inconvenience, yet soft enough to be cut with a stout knife. They burned slowly when touched with a match. Millefleurs says they are non-explosive and inexpensive.

THE GOOSE QUILL VS. THE STEEL PEN.—In the English Patent Office, where of all places in the world some knowledge of inventions should exist, the steel pen is unknown. The old goose quill is the most recent writing implement in existence, so far as can be gathered by a visit to the official library, and as many a quill is as useful for legible writing as the end of a burnt match, some of the notes taken there much resemble the track of a snail.

ELECTRICITY.

Progress of Electrical Industry.

The great advance in the application of electricity to useful purposes during the last decade is one of the marvels of modern industrial progress. Until quite recently very little attention was paid to mechanical engineering as applied to electricity. The construction of electrical instruments and machines and their erection and use were in the hands of persons who knew but little about electricity. At present, however, the best dynamos and other electrical appliances are made by experienced electrical and mechanical engineers. Observation shows that the electrical industries of to-day are more and more demanding the services of both skillful mechanical engineers and well educated electricians.

Twenty, even 15 years ago, very little was known about exact mechanical calculations concerning electrical phenomena. It was scarcely thought that there was a science of electricity apart from its mere natural history. Even up to ten years ago, aside from the electric telegraph, very little was known in regard to electricity except what may be called the production of electric tricks. The researches of Cavendish, Faraday and Joule and the valuable papers of Sir William Thompson were simply buried in scientific journals, and but little attempt had been made to apply them to mechanical progress or the useful arts of life.

It is only within the decade just passed that the electrician has become also a mechanical engineer and sought useful appliances for this wonderful and mysterious agent. Now the hand of the electrical engineer may be seen everywhere. He has wandered away from his telegraph poles and may be seen in the shop, in the factory, on the railroad, on the farm, in the mine, in the dwelling and in many of the useful arts, where he is applying his genius to modify the handiwork of man and in devising improved means to useful ends in almost every industrial operation.

To-day the electrical engineer can design a thing with an exact knowledge of what it will do. His calculations are as close and reliable as those of the mechanical engineer. The world has entered upon a new and most important engineering science, the possibilities of which are almost inconceivable. This new mechanical science has made greater progress within the last ten or twelve years than was reached by steam in any 100 years of its advance. It is just now, in this country especially, the all-absorbing study of an increasing number of mechanics and electricians, which has already become a vast multitude, who are constantly employing their inventive powers in contriving new devices and studying with all their energy to acquire a still clearer knowledge of the science and application of electricity. Our people, our government, and even the proudest European diplomats and potentates, are giving honor and applause to the experimenters and inventors who lead in this great work of modern progress. While we would not take a single leaf from the well earned wreaths of the distinguished scientists whose investigations have made this work possible, we would give the highest honor to the eminent mechanicians who have made a practical application to the use of man of the scientific facts which have been placed before the world by the men of science.

We would say, with a late writer on "The Future of Electricity," that "We who are unfortunate enough to have less than half of our probable time of life to look ahead to, are greatly pleased with the rapidity of electrical development, as it assures us the probability of seeing many wonderful advances to be made in the growth of this science, both pure and applied. But we realize that the inventions and discoveries of the near future are likely to be closely allied to the accomplishments of the present."

"The development of new fields is to be left to succeeding generations. We can hardly hope within the present generation to see the successful production of electricity in large quantities for commercial use direct from the crude material instead of the present expensive method of passing the energy through the boiler and steam engine. The full understanding of the production of light by the fire-fly and the applications in that direction are certainly too far ahead to afford us, for the present, more than a mere ray of hope of anything more than an imaginary picture of what in time will surely come to pass."

ELECTRIC SHOOTING.—The French minister of war is making some experiments in electric shooting, and intends to arrange so that he can discharge his guns upon the enemy from unexpected places by means of an electric current. By placing a battery on a hill, in a fort, or at the entrance of a defile, it would be possible to shoot from a distance or automatically discharge the artillery at any precise point of the line of defense.

A NOVEL APPLICATION OF ELECTRICITY.—An enterprising restaurant proprietor has made a novel application of electricity, namely, to the lighting of cigars. On the top of the case in which the cigars are kept stands a little oblong machine. It has the usual sockets containing methylated spirits and torches, and on its sum-

mit is a little square projection. To light his cigar the smoker takes one of these torches, sees that it is well soaked in the spirits, and touches it sharply against the projection, which instantly emits a volley of sparks and sets the end of the torch ablaze. The current comes from electric wires up above, from which a couple of light wires run down to the quaint little instrument.

CONGRESSIONAL INVESTIGATION.—Mr. A. J. De Camp of Philadelphia has circulated a petition asking Congress to appropriate the small sum of \$50,000 for the purpose of investigating electric lighting, not only with a view of ascertaining the figures that represent its growth, but specially with the object of inquiring into the casualties that have resulted from the use of electric currents, and as compared with casualties from other agents employed for similar purposes. This is a timely appeal.

THE BUILDER.

A FIRST PRINCIPLE OF BRIDGE BUILDING.—If one plank would hold up 100 pounds on the center, then the two planks, placed side by side, would hold up 200 pounds, while placing the planks one on top of the other end nailing them firmly together they would hold up 400 pounds. In this way we see that, in order to increase the strength of the bridge, or beam, faster than we increase the amount of material, the increased amount of material should go into the depth of the beam and not into the width of it. This is one of the first principles in the resistance of material, that the strength of a beam varies directly as the width—that is, if we make the beam twice as wide, it will hold twice as much; and that the strength varies as the square of the depth—that is, if we make it twice as deep it will hold up four times as much. If we make it three times as deep, it will hold up nine times as much of a load. So it can readily be understood that in order to increase the strength of the bridge or beam without increasing the material in the same proportion, the increased amount of material should be put into the depth and not into the width.—*Ex.*

FRENCH PROCESS FOR HARDENING PLASTER.—The following process comes from France for hardening plaster, so that it may be used for flooring, as wood and tile are at present: About six parts of good quality plaster are intimately mixed with one part of freshly-slacked white lime finely sifted. This mixture is then laid down as quickly as possible, care being taken that the trowel is not used on it for too long a time. The floor should then be allowed to become very dry, and afterward be thoroughly saturated with sulphate of iron or zinc—the iron giving the strongest surface, the resistance to breaking being 20 times the strength of ordinary plaster. With sulphate of zinc the floor remains white, but when iron is used it becomes the color of rusted iron; but if linseed oil, boiled with litharge, be applied to the surface, it becomes of a beautiful mahogany color. Especially is this the case if a coat of copal varnish be added.

STEEL HOUSES NEXT.—A very favorable account is given in the French papers of the system of building houses of steel plates, introduced some time ago by M. Danly, manager of the Societe des Forges de Chatellain, and who has set forth its various advantages in an interesting and plausible manner, attracting considerable attention. M. Danly has satisfactorily ascertained that corrugated sheets of no more than a millimeter in thickness, are sufficiently strong for building houses several stories high, and the material used allows of quite a variety of architectural ornamentation. The plates thus employed are of the finest quality, and, as they are galvanized after they have been cut to the sizes and shapes required, no portion is left exposed to the atmosphere. It is asserted that houses constructed in this manner are very sanitary, and that the necessary ventilating and heating arrangements can be readily carried out.

A SPANISH FIREPROOF FLOOR.—A new system of fireproof floor construction has recently been introduced into this country from Spain, where it has been in use a number of years. Its general features are the use to form the arches of a hard, well burned clay tile laid flat with the several courses breaking joints. The composition of the mortar is a secret, but it adheres so closely to the tile itself, and is so firm and solid when it has fully hardened, that its strength is about equal to that of the tile. The arches are either cylindrical or domed, and in either case weigh but little more than half the weight of brick arches as ordinarily constructed. The principal saving, however, is the reduced number of beams used, owing to the considerably greater span which may be made with the tile arch.

A GOOD IDEA.—The Boston *Transcript* concludes that it would be a good thing if the names of architects were conspicuously displayed on buildings they had planned, as "it would save so much time to persons who purpose building, in making up a list of architects to be avoided." It isn't a bad idea.

Passing Events.

The trouble between the foundrymen and the molders in San Francisco still continues. The men brought from the East joined the strikers soon after their arrival, but others are on the way. The foundrymen are convinced by experience that they cannot continue to operate their shops under the conditions demanded by the molders. The strike may last for months to come.

Many of the mines in this State have all they can do at present to handle the seepage water and are doing little toward ore extraction. The ground is soaked full of water which flows into the mines, entailing great expense for pumping.

The storm of this week was felt all over the central and northern portions of the State, and more snow has fallen in the Sierras, materially adding to an already great accumulation.

The developments in the suit concerning the Mulatos mine, referred to elsewhere, will be looked for with interest by mining men, as the "operators" are well known throughout the State.

The Mulatos Mine.

In September last the Mulatos mine in Sonora, Mexico, was sold to a syndicate of London and San Francisco capitalists by the Agnayo Bros., the Mexican owners, Alvinza Hayward of this city acting for the purchasers, he being one of them. The price paid was \$1,575,000, of which \$875,000 was in cash. This week an action was commenced by the Oro Grande Co. (the incorporated name) for a rescission of the contract of sale, the plaintiffs desiring to return the property and regain their money. The plaintiffs allege in their complaint that the samples of ore given by the owners or their agents to the purchasers had been tampered with, or, in the familiar phrase of the miner, had been "salted," and that they had in consequence been swindled. The complaint also prays for an injunction restraining the defendants from disposing of any of the money or securities turned over to them.

It is stated that Alexis Janin and D. B. Gillette reported on the mine, but the samples were "salted" on them. Mr. Janin, in a card, explains that he examined the mine for other parties two years ago and reported the average yield as \$5 per ton, and advised sampling by millrun and not assays. Mr. Janin's report was to Smith and De Crano and not to Hayward and Hobart, and his principals declined to purchase, since which time he has had nothing to do with the matter.

Mr. Gillette was well equipped to sample and assay, and it is hardly probable that any "salting" would have deceived him, either.

It seems the Agnayo Bros. left a good deal of their money here with their agent, W. Loiza, which seems strange if they had perpetrated a swindle. In fact there have been several attempts to sell this Mulatos mine, and there are several expert reports extant, so its value ought to be as well known as any mine in Mexico. That Messrs. Hayward and Hobart, two of the most experienced mine operators here, should have been swindled on a mining proposition, is very remarkable. Their man Montgomery, who is at the mine now, did not go before they purchased, neither did either of the gentlemen named visit the mine in person, as is their custom when making such a purchase.

The prominence of the purchasers and the experts, the sums paid and the notoriety of the mine, make this a very interesting case, and the legal developments will be awaited with interest. Without knowing any of the details, the opinion is expressed by some that perhaps the purchasers expected to make a "London deal," in which they failed, and now want to drop a bad bargain.

Iron Abroad and at the East.

Since the commencement of the year there has been quite a fall in the price of iron in England and also at the East. To those who had closely watched the advance, the decline has been no surprise; the only surprise was that prices abroad went as high as they did. The causes which led to advance were largely reduced stocks, many furnaces out of blast, and an enlarged demand for iron ships. This naturally brought into the field speculators, who ran up Scotch warrants to unwarrantable figures, which had a direct bearing on pig iron, for large consumers rushed into the market to anticipate their wants, and this buying precipitated the advances. The decline of the market is from natural causes, and briefly stated are a close money market, consumers holding off and shipowners not placing any further orders, preferring to await a lower range of values for iron, which they thought inevitable owing to more furnaces having gone into blast. With more furnaces in blast the stock of iron would soon gain on the consumption.

In the Eastern States the market moved up in sympathy with the advance abroad, but with better prices more furnaces went into blast. On June 1, 1889, there were 283 furnaces in blast, with a weekly capacity of 137,119 tons, and on March 1, 1890, there were 343 furnaces in blast, having a weekly capacity of 180,991 tons. The furnaces in blast have not only increased in numbers but more are to follow. In the number of new furnaces blown in, the Southern States are largely represented, particularly West Virginia, Alabama, and Tennessee.

With an enlarged output, lower prices are a

natural result, yet this will be offset by an enlarged demand, for present advices indicate that the consumption in this country this year will be larger than for any preceding year. This is based on the growing requirements for more railroads in the Southern and Southwestern States, the building of war vessels and also extensive improvements in many sections, which will require large quantities of iron.

The Roney Mechanical Stoker.

The Roney mechanical stoker (shown in the cut as applied to a Babcock and Wilcox boiler) is a simple apparatus, which, when attached to steam boilers, receives the fuel in bulk, and thereafter, without further handling, feeds it continuously and at any desired rate to the furnace; burns the combustible portion and deposits the ash and cinder in the ash-pit ready for removal.

The fuel to be burned is dumped into the hopper on the boiler-front. In small plants, it may be shoveled in by hand. In large plants, it is usually handled direct from the car to the hopper by elevators and conveyors. Set in the lower part of the hopper is a pusher to which is attached by a flexible connection the feed-plate forming the bottom of the hopper. The pusher, by a vibratory motion, carrying with it the feed-plate, gradually forces the fuel on to the grates over the dead plate. These grates consist of horizontal flat-surfaced bars running from side to side of the furnace, carried on inclined side-bearers extending from the throat of the hopper to the rear and bottom of the ash-pit. The grates, therefore, in their normal condition form a series of steps, on to the top step of which coal is fed from the dead plate. These steps at the inclination given would, however, prevent the free descent of the coal. But each bar rests in a concave seat in the bearer and is capable of a rocking motion through an adjustable angle. All the grate-bars are coupled together by a rocker-bar, the notches of which engage with a lug on the lower rib of each grate-bar, pin connections being made with two of the grate-bars only, for the purpose of holding the rocker-bar in position. A variable back-and-forth motion being given to the rocker-bar, through a connecting rod by a device to be hereafter described, the grate-bars necessarily rock in unison, now forming a series of steps and now approximating to an inclined plane with the grates partly overlapping like the shingles on a roof.

Assuming the grates to be covered by a bed of coal, and fresh fuel being fed in at the top, it is obvious that when the grates rock forward the fire will tend to work down in a body. But before the coal can move too far, the bars rock back to the stepped position, checking the downward motion, breaking up the cake thoroughly over the whole surface and admitting a free volume of air through the fire. The rocking motion is slow, being from seven to ten strokes per minute, according to the grade of the coal. This alternate starting and checking motion being continuous, keeps the fire constantly stirred and broken up from underneath, and finally lands the cinder and ash on the dumping-grate below. By releasing the dumping-rod, the dumping-grate tilts forward, throwing the cinder into the ash-pit, after which it is again closed ready for further operation. The dumping-grate is made in two parts, so that each half can be dumped separately. The operation of the stoker, therefore, consists of a slow but continuous feed, a constant stirring of the fire, and an automatic rejection of the cinder, all performed without opening the fire doors.

The actuating mechanism is simple. All motion is taken from one driving shaft. In a single stoker this shaft may either be driven through a worm gear from a small engine attached to the boiler front and consuming a hardly measurable fraction of a horse-power, or it may be driven by a link belt from any convenient point of the nearest shaft. In large batteries of boilers the driving shaft is extended across all the boiler fronts, delivering power to each stoker, and with the elevators and conveyors is driven by a small independent engine. The largest stoker can easily be turned over by hand, indicating the nominal power consumed. The worm gear shaft carries a disc and wrist pin from which a link couples to the agitator. Through the eye of the agi-

tator passes a stud screwed into the pusher, on which stud is a feed-wheel by which the stroke of the pusher and consequently the amount of feed is regulated. The agitator having a fixed stroke, it is apparent that if the feed-wheel is run down against it the pusher will be given its full traverse and the greatest feed. If run back to clear the travel of the agitator, the pusher will of course have no motion and the feed will stop. Between these extremes any desired rate of feed can be given.

In like manner the rock of the grate-bars can be adjusted between any limiting angles, and over a range of motion from no movement to full throw, by means of the sheath nut and jam nuts on the connecting rod. By these two simple adjustments within the comprehension of the ordinary helper, the whole action of the stoker is controlled and the fires forced, checked or banked at will. There are poker doors in the front on each side of the hopper, through which the whole grate can be seen and the condition of the cinder on the dumping-grate determined. A gate controlled by a couple of band-wheels shuts off the hopper from the furnace altogether when desired.

This is a very simple device for so important a purpose. The motion is very slow, and any bar can be picked and replaced easier than in the ordinary flat grate. Although the cut shows the mechanical stoker applied to a Babcock and Wilcox boiler, it can be applied to those of any kind. A number of these devices have been put in use here in San Francisco of late by the California Engineering Co. of room 103 Pbelan building.

The Foundry Strike.

The main features of the foundry strike this week have been the arrival of a special train with molders from the East, and the subsequent desertion of most of them from the foundries where they were placed. Fifty-four men started from Philadelphia, but some deserted on the way and 46 arrived and were taken to the foundries where they were to work. Arrangements had been made for the men to eat and sleep at the works, so they should not be intimidated by the striking molders. Policemen and guards have been on duty at the foundries to prevent any disorder, but no violence has been attempted. Only six of the imported men are now at work, the others having violated their contracts and joined the strikers. A number more men are on the way, however, being brought here by the Foundrymen's Association, who had anticipated that many would desert. If they keep on bringing men, they will flood the town with molders that the Molders' Union must support, send back or permit to work. A number of molding machines have also been sent for with which a certain class of work may be done.

Contracts have been let East for about \$200,000 worth of castings, which will be finished here to fill standing contracts. All this is a direct loss to San Francisco mechanics.

The manufacturers seem a unit in insisting that they must win this contest if they intend to continue business; otherwise Eastern competition will close them out. If they cannot secure molders here or in the East who are willing to work, they must discharge the pattern-makers, boiler-makers, machinists, helpers and apprentices, and go out of business. The Molders' Union is a powerful organization and has practically dictated terms for years. The manufacturers have chafed over the situation, seeing business go away from their doors to cheaper centers of labor, but have been unable to prevent it. When it came to a limitation of work in addition to high wages, the foundrymen could stand it no longer. Now that the men have struck, the long-expected fight has commenced and may last for months. Two or three more of the smaller foundries have closed down and discharged their men. The large shops are all working under difficulties, but are all united in their action, and fully expect to win in the end.

The Giroux Amalgamator Co. ask from Baker City, Oregon, a subsidy of \$25,000 for the erection of sampling works and machine shops at that place. The sum of \$17,000 has been subscribed, and the whole amount assured. Baker City is a very lively mining center in these days, and bids fair to be a much livelier one as the rich mines which surround it are developed.

Artesian Wells.

As mentioned in last week's PRESS, the people of Oakland, dissatisfied with the water furnished by the local company, are considering the question of artesian supply for domestic purposes. For as large a city as Oakland, this is an important engineering problem, and one requiring careful investigation. It will not do to bore wells at haphazard wherever is most convenient, nor must any specified area or section be overtaxed for supply. Competent engineers should study up the whole question in detail and report before any active steps toward general work are taken.

It is, however, by no means unreasonable to suppose that a domestic supply can be obtained. There are already many such wells in Oakland and other parts of Alameda county. They are not flowing wells, but the water comes up very close to the surface. Pipe connections under ground below the water level in the wells would cause a steady flow to any given point, whence the water could be lifted to a suitable elevation for necessary progress in the dwellings. In the city of Memphis tunnels connect the wells with common snmps or cisterns, so that the water flows to these points and is there pumped to required heights.

By thus tapping the wells below the height of natural rise, the well becomes a flowing one, the amount depending, of course, on the location and richness of the artesian bed.

Riverside, in this State, has its water supply for domestic purposes entirely from artesian wells, a separate supply being brought in for irrigation. There, the wells flow above the surface and the water is conducted to an aerating

the PRESS we had occasion to refer to this subject and here reproduce some sketches bearing on this point.

Where there must be several wells, then distribution is a matter of consequence. The normal direction of flow, when once it is set up, by virtue of the opening of an avenue of discharge, is along a line drawn from the outcropping edge of the bed down its slope to the wells. Now it is clear that if several wells are

FIGS. 1 AND 2.—Tabular Sections of Strata, Showing Disadvantageous Arrangements of Wells.

FIGS. 3 AND 4.—Tabular Sections of Strata, Showing Advantageous Arrangements of Wells.

arranged along this line, the first one will be better placed than those which stand below it. These will be, indeed, measurably supplied by lateral flow under the law of equal pressure, but less direct and freely. If the wells are disposed in a cluster, those on the exterior will partially cut off the supply of the interior wells. A more fortunate disposition than either of these would be an arrangement in a line at right angles to the direction of flow.

A still more advantageous arrangement, enh-

tical considerations limit their dispersion.

Figs. 1 and 2 exhibit tabular sections of strata, showing disadvantageous arrangement of wells. Figs. 3 and 4 are tabular sections, showing proper and advantageous arrangement of wells.

In the MINING AND SCIENTIFIC PRESS of Jan. 26th and Feb. 9th, 1889, were published articles on "The Requisite and Qualifying Conditions of Artesian Wells." Nov. 9th, 16th and 23rd,

we presented articles by C. E. Grunsky, C. E., on "Artesian Wells in California." In 1878 and 1879 we also published a series of articles referring in detail to artesian wells in various parts of this State. In all of these are very many interesting and practical facts which will be found useful to those considering the subject of artesian wells.

THE Kansas City smelting men are arguing with the Congressional Committee in favor of

The Colorado Canyon.

(Continued from page 197.)

tudes which had added enormity to coarseness, now become replete with strength and majesty.

The observer who visits the commanding point with the expectation of experiencing forthwith a rapturous ecstasy will be disappointed, for he will be simply bewildered.

But those who have long and carefully studied this grand canyon of the Colorado river pronounce it by far the most sublime of all earthly spectacles. If its sublimity consisted only in its dimensions, it would be sufficiently set forth in a single sentence. It is more than 200 miles long, from 5 to 12 miles wide, and from 5000 to 6000 feet deep. The common notion of a canyon is a deep, narrow gash in the earth with nearly vertical walls. There are hundreds of chasms in the Colorado-river country which answer this description. Many are frightfully deep and 50 to 100 miles long. Some are exceedingly narrow where the overhanging walls shut out the sky. Yet the chasm of the Colorado and the trenches in its rocks, which answer to the ordinary description of a canyon, are in marked contrast.

The engraving on the first page, which is a reproduction on a smaller scale, of one of the plates in Dutton's U. S. Geological Survey monograph on the Grand Canyon, shows a panorama from Point Sublime. From the end of this point the distance across the chasm to the nearest point on the summit on the opposite wall is about seven miles. This does not, however, fairly express the width of the chasm, for both walls are recessed by wide amphitheaters setting far back into the platform of the country, and the promontories are comparatively narrow strips between them. A more correct statement of the general width would be from 11 to 12 miles. This must dispose at once of the idea that the chasm is a narrow gorge of immense depth and simple form.

The length of the canyon revealed clearly and in detail at Point Sublime is about 25 miles in each direction. The space under immediate view from our standpoint, 50 miles long and 10 to 12 wide, is thronged with a great multitude of objects, vast in size, majestic in form, and infinite in detail. The cut only conveys a faint impression of the magnitude of the surroundings.

In a Drift Mine.

We give on this page a view in the Red Point drift mine, Placer county. The photograph was taken by W. C. Ralston, of the Hogback mine, with a flash light. The view is at the gravel-breast, about 3000 feet from the mouth of the tunnel, and shows the height of the auriferous gravel at that point. The gravel varies from three to seven feet in height. It is rather difficult to get photographs of this sort underground, but Mr. Ralston succeeded pretty well in this instance. It is the first time we have been able to obtain underground pictures in the drift mines, though many have been made in the quartz mines. We shall shortly reproduce other photographs of the drift-mining section of Placer county.

THE ECLIPSE MINE.—The Eclipse mine at Ophir, Placer county, is an old location but has laid idle some years for lack of capital for machinery. Recently J. B. Patterson, a prominent resident of Placer county, obtained an option on the property, and succeeded in placing it with a strong Eastern company and securing the necessary capital for its development. We are told that the main ledge is 20 feet wide, the ore running \$18 in free gold, exclusive of sulphurets. There is ample water-power, and there is now in course of erection a 20-stamp mill, the machinery for which has been completed in this city. It would now be in operation but for the obstructions to transportation caused by bad weather. The property is under the management of Mr. Patterson.

THE Reno reduction works were just overcoming the many difficulties and becoming fairly prosperous, when destruction by fire entailed a direct loss of \$50,000, and an indirect loss of many more thousands to Reno and the State of Nevada generally.

THE Koreans have some good silver, gold and copper mines, but do not like foreigners to become interested in them.

AT THE BREAST OF THE RED POINT DRIFT MINE.

basin and thence to the city. The pipes deliver 3,600,000 gallons a day for domestic service. The two systems, domestic and irrigation, are entirely separate.

In the boring of wells on a large area such as may be considered at Oakland, great care must be taken as to taxing the available supply of water in the artesian strata. All the way from Berkeley to San Jose wells are found, so there is no fear of failure. The only thing is to do the boring systematically and properly, having only a certain number of wells in a given area, and boring them with proper relation to each other. There is a proper and an improper way of locating the wells. In a former number of

ject to local modification, would be to dispose the wells in a curved line, convex toward the collecting tract, for when the draft of the wells has made itself felt upon the sheet of water flowing most directly from the collecting belt to them, the higher pressure which the flanking portions still suffer will cause a lateral inflow, and the curved disposal of the wells will be more favorable for receiving the ingathering current than a rectilinear arrangement, being more nearly normal to the resultant pressure and flowage.

In respect to the degree of separation the farther they are apart the better, for they will affect each other less; but, of course, prac-

letting Mexican lead ores in free. The lead-miners of this country are violently opposed to this idea, for the custom is ruining the lead mining industry, whatever it may be doing for the smelters.

MR E. K. STEVENOT says the mining business about Angels Camp, Carson Hill and Chaparral Hill, Calaveras Co., is very prosperous, as they are mining on business principles and handling ore which a few years ago was impossible. There will be a good deal of wealth taken out of the mines situated between the Stanislaus river and Angels Camp, and new properties are being developed right along.

The Pittsburgh Boiler Scale Resolvent.

This Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.

CARNEGIE BROTHERS & CO., PROPRIETORS OF EDGAR THOMSON STEEL WORKS, }
PITTSBURGH, PA. WORKS AT BRADDOCK. } Oct. 4, 1887.

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have tested nearly all Compounds presented to us, and this one is the only good thing we have ever used. Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as sulphate of lime, carbonate of lime, mud, and everything that is bad. Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Alleghany Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern, Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT }
{ PROVES ENTIRELY SATISFACTORY. }

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal. J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,
And will furnish descriptive Catalogues and quote prices upon application.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery. Adapted to heads running from 20 up to 2,000 feet. From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, March 20, 1890.

General trade the past week was active, with a decided increase in the volume of goods going out on orders. The iron-molders' strike continues to be a drawback among foundrymen and machine factories. It now looks as if the disagreement will not be settled soon. So far as we can learn, the feeling in the community is against the strikers, for with labor and raw material cheap at the East, and overland freights to this coast considerably lower than a few years ago, foundrymen and machine factories must either get cheaper labor or cheaper raw material, or "shut up shop." Cheap raw material with the import duties so high is out of the question.

The money market continues to gain in ease under free remittances for the time of the year; while the demand for funds is only fair, not up to what usually obtains in this month.

QUICKSILVER—Receipts the past week aggregated 549 flasks. The exports by overland railroad in last month aggregated 27,000 pounds. The market continues to rule very strong. Both the European and Eastern markets are reported strong.

The exports hence by sea the past week aggregated as follows: 28 flasks to Central America and 215 flasks to Mexico.

SILVER—The market abroad and at the East strengthened and then set back again. The quick moves indicate that silver is under speculative influences. Political affairs in Germany, with their influences on other European countries, may possibly have considerable bearing on the market. The resignation of Prince Bismarck, as Chancellor of Germany, is taken by some as favorable to silver. This opinion is grounded on the fact that through Bismarck's influence Germany demonetized silver, and that the new Chancellor may hold to different views on the metal. In Congress no further action has been taken to remonetize silver, but in usually well-informed circles the opinion is gaining ground that at this session a free coinage bill will be passed. Judging from the petitions favorable to free coinage, sent in from all sections of the country to Congress, a large majority of Americans favor it.

The Mint paid 95½ cts. for silver bullion up to Tuesday, when the price was reduced to 95¼ cts. The offerings were very small. Exporters are out of the market, not being able to compete against the Mint, while sterling exchanges are weak and no present prospects of their going higher but rather lower, owing to the heavy exports of breadstuffs, provisions, etc.

BORAX—Exports the past week aggregated 658 lbs. to Mexico, and in last month 637,740 lbs. overland. The market continues to hold to full figures, with a free call from the East.

LIME—Receipts the past week aggregated 3288 bbls. The market shows a freer call, but prices remain steady. The impression prevails that the consumption this year will be larger than it was in 1889.

LEAD—The local market holds to steady prices. At the East the market has fluctuated, closing fairly strong. The holding interests are very confident of the future, and consequently offer sparingly, which helps in maintaining the strong market. English advances report an easy market.

ANTIMONY—The market is beginning to show signs of easing off, in sympathy with lower prices at the East.

TIN—Imports aggregated 2241 ingots from Australia. The market is fairly steady for pig, but for plate it is still flat. It is difficult to give correct quotations on plate. Several of the largest makers expect still lower figures. Late cablegrams to the Iron Age report as follows: "The Tin Plate Workers' Union have held further meetings, at which owners of 45 works, in addition to those who previously agreed, signified their intention to stop. Thirty others agreed to the proposal to stop during the last ten days of the month. Ten firms refuse to join the movement. The Union is determined not to be thwarted and will exhaust all resources to bring opposing masters to comply with their mandate. The Morewoods are the greatest obstacles. The Treforest will not stop for any great length of time. Stocks continue to accumulate at the shipping ports and amount now to 537,000 boxes against 336,000 boxes a year ago. The February exports to the United States were only 18,000 tons against 28,000 tons during the corresponding month last year. A larger business has been done during the week at inside prices."

COPPER—There is absolutely nothing new to report. The consumption in this country is steadily increasing, while the output does not show any material increase. From England late advices report as follows: "Copper bars are being gradually absorbed in the place of furnace material by consumers, but merchant warrants remain flat, speculation being affected by the depression on the Continental Bourses. A large business was done, chiefly for consumption, at £46 10s early in the week, since when prices have improved slightly."

IRON—Imports the past week aggregated 1000 tons. The market continues unsettled. Although no lower quotations are given, yet it is reported that concessions are obtainable. Probably this is due to a growing impression that the iron-molders' strike will result in fewer contracts entered into for new work, which will seriously curtail the consumption of iron. The stock here shows a large increase in the hands of both consumers and importers. From the East our advices indicate that consumers are holding off in the hope of still lower prices; when they do enter the market, it looks as if the market will improve. From England late cable advices report as follows: In pig-iron warrants there has been little business, but stocks in store are steadily decreasing, and that fact steadies the market somewhat. Hematites are improving in price. Makers have blown out six furnaces and agreed to further restrict production if necessary. Exports of pig iron to the United States last month 8000 tons, against 7000 tons in February, 1889. Makers' quotations for all descriptions of pig have been marked down, and are now nearly on a level with warrants.

COKE—Imports the past week aggregated 650 tons. While we do not reduce quotations, yet it is generally understood that concessions can be obtained.

COAL—Imports the past week aggregated as follows: Departure hay, 4406 tons; Coos hay, 1950; Seattle, 3849; Nanaimo, 2005. Total, 9210 tons. Australian coals are strongly held for spot, to arrive and for loading. All cargoes to arrive have been placed. Ships on spot and to arrive in Australian waters are showing more strength. This is reflected by a ship now loading lumber on Puget Sound for Australia, refusing a return cargo of coal to this port at the rate of 15s. In household coals the market shows no material change. The tone appears to be strong, due to the small stock on hand and to arrive of Australian. The expected advance in Wellington has not materialized.

Eastern Metal Markets.

By Telegraph.

NEW YORK, March 20, 1890.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday.....	43½	94½	\$14 25	\$3 97½	\$20 55
Friday.....	43 13-16	95	14 25	3 97½	20 60
Saturday.....	43½	95½	14 50	3 97½	20 60
Sunday.....	43½	95½	14 50	3 95	20 35
Tuesday.....	43½	94½	14 50	3 92½	20 30
Wednesday.....	43½	95	14 50	3 95	20 40

NEW YORK, March 18.—Borax steady. Quicksilver is firm in sympathy with the European markets. Copper is in moderate demand at 14½¢ @ 14¾¢; Lake, 12½¢ @ 13¢; Casting Lake reported well sold up. Pig lead is quiet and firm at \$3.97½.

Mining Share Market.

The mining share market the past week was generally dull, although at times there were small short-lived spurts, evidently made to frighten shorts into filling so as to allow the pool to better concentrate the stocks they mostly desired. The news from the Comstocks is uniformly favorable—too good, if anything, to let the public have much of the stocks, and the public never buy on such a market as we now have. The outside stocks have not done much; hardly any transactions have taken place in either the Bodies or Quiltoas, while the Tuscaroras were only fairly traded in. The points are out for lower prices in the Tuscaroras, Bodies and Comstocks, although the latter might first go higher before going much lower. The Bodies are, it is said, to have a break when they are a "big buy."

News from the Comstocks is of the very best, particularly in the Gold Hill and the Middle mines. Private advices also report an improvement in Ophir. Advices from Con. Virginia still continue favorable. Official letters received to-day (Thursday) from Crown Point, Belcher, Confidence and Hale and Norcross report as follows: In Crown Point, the 300-foot stopes are improving as the work goes south. They are crushing on an average, about 850 tons of ore a week, which assays higher than that crushed in February. In Belcher a new south drift has been started which was in quartz assaying from \$5 to \$25 a ton. In Hale and Norcross the drift on the 1250 foot level was in fine ore six feet wide (fine ore, it is said, assays from \$40 to \$60 a ton.) In Confidence a west crosscut was started the past week on the 300-foot level and another on the 800-foot level. The first mentioned was, at last advices, in low-grade ore. The starting of these two crosscuts will be followed by others in some of the other mines through which the north drifts run from the Yellow Jacket shaft. This new work shows that the north drifts have either been completed or are nearing completion. These drifts were run to afford the best of ventilation in the mines, so that prospecting work could be successfully carried out.

One of the best signs of the times is the confirmed reports that the Comstock mines have bought more quicksilver so far this year than for the like time for several years past.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Bullion Shipments.

We quote shipments since our last and shall be pleased to receive further reports:

Cons, California and Virginia, March 15, \$14,297; Savage (for February), \$24,073; Hale and Norcross (for February), \$31,198; Commonwealth, \$15,450; Justice, 20, \$4574; Commonwealth, 20, \$17,000.

A LANDSLIDE near Juneau, Alaska, buried one of the quartz-mills out of sight. No one was injured.

Attention, Southern California Miners.

WORKS FOR SALE.

The Works are situated at Daggett, Cal., in the Calico Mining District, and on the side-track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power Engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to GILLISPY & CHILDS, 123 California St., San Francisco.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$900, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and farther information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)
Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, Jr.,
[Signed] Supt North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

Quarrying Sandstone.

We give herewith an engraving showing the method of quarrying triassic sandstone at Portland, Conn., taken from Geo. P. Merrill's Smithsonian monograph on "Building Stones." As now worked, the quarries descend with absolutely perpendicular walls on three sides for a depth of 150 feet, the fourth side being sloping to allow for the passage of teams and workmen. In quarrying, channeling machines are used to some extent, though in many cases large blocks are first loosened by powder and these then split up by wedges. The blocks are then slightly trimmed up and shipped, scarcely any of the material being dressed at the quarries. Some of these blocks have been shipped to this city. Little quarrying is done in cold weather, as care must be taken against freezing while the stone is full of quarry water, a temperature of 22° being enough to freeze and burst five blocks of freshly quarried material. About a week or ten days of good drying weather is considered sufficient to season a stone as to place it beyond danger from frost.

EDISON, the inventor, is experimenting with sulphuret ores from North Carolina, and is reported to have perfected a process for working them. It is to be hoped that he has a cheap method, in which case there is plenty of room for him to introduce his process in California.

The Stewart Mining Bill.

A Defective Measure Criticised.

EDITORS PRESS:—In the spring of 1888, Senator Wm. M. Stewart intimated publicly that he wished miners and mining writers to criticize a mining bill he had introduced in Congress. This naturally led to the belief that he was willing to receive and would make use of sound, practical suggestions in perfecting the measure. Several correspondents of the PRESS offered excellent advice, and stated their objections to some of the changes proposed in the existing law. On March 10, 1888, there appeared in the PRESS a copy of a letter I had addressed to the Senator on that subject. In privately replying to my letter, he wrote on March 16th as follows:

"Yours of the 22d ult. came duly to hand. I have carefully considered the various objections suggested by you, and hope that when the bill is finally perfected, it will meet with your approval. I am not hurrying the matter at all, in order that everybody may have time to consider the measure and offer such suggestions as they see fit."

Last summer Mr. Stewart sent me a printed copy of his "amended" bill which, on January 10, 1889, had been ordered to be reported in the House of Representatives. Along with it was a lithographed letter, similar, as I afterward learned, to letters he had widely addressed to the editors of mining and local journals, again soliciting suggestions and criticisms in regard to it. In reply to his, I wrote him to say that it was useless to suggest amendments when it was plain they would be disregarded. I also informed him that unless his bill was improved, I should endeavor to defeat it by calling the attention of miners to its dangerous features.

Up to that time I believe Mr. Stewart was sincere in his repeated calls for practical hints, but on discovering the fact that he had not adopted a single suggestion made by PRESS correspondents, I changed my mind, and concluded that he required to be closely watched.

The editors of the PRESS, however, still had confidence in his sincerity, and besides printing the amended bill, they gave correspondents the privilege of publicly criticizing it. For a number of months there appeared at short intervals in its pages sound practical letters from distant points, in which the defects of the proposed measure were plainly stated. The criticisms in these letters were well fitted either to aid its author in improving it or to warn him that if no improvement was effected, he would have to face a dissatisfied mining public.

On December 4, 1889, Senator Stewart introduced a new mining bill in the Senate, which being twice read, was referred to the Committee on Mines and Mining. Through the kindness of Delegate M. A. Smith of Arizona, I have obtained a copy of the "perfected" bill. It is fortunate for the mining interests of the country that Mr. Smith is on the above committee. He is able, alert and enterprising, and if convinced that the proposed legislation is unnecessary, or deserving of condemnation, he will fight against it to good purpose. If the PRESS will on public grounds grant me space to criticize the new bill, I shall, in compliance with Mr. Stewart's repeated requests in past years, try to expose its true "inwardness" in the sight of practical mining men.

In place of this being a new bill, it is merely the old one of last year, and not one of the second set of suggestions toward improving it which appeared in the PRESS has been adopted any more than the published hints in its pages two years ago. The date and one unimportant word have been changed, that is all. This fact seems to indicate that Mr. Stewart must either regard the many objections—without any commendations—offered to the product of his mind as unworthy of consideration or he has been guilty of obtaining newspaper notoriety by means of representations that are very far from being creditable to him as a public man.

The First Change Proposed

In the Act of Congress approved May 10, 1872, under the Stewart bill, is by the addition to Section 2319 of the following: "But no person shall acquire by location more than fifteen hundred feet in length on the same vein, nor shall any person relocate a claim which he has previously located."

If there was a pressing demand by capitalists for mines to be explored in deep works, and our wide mineral domain was so well prospected and fully occupied that it was necessary to curtail the space each operator should control, so as to afford room for all, it might be wise to restrict a locator to a single claim on a given lode; but as there are hundreds of mining claims on the market for every cash buyer who appears, that time has not arrived.

Lodes in Groups.

The purchasers of mines in coming years will want lodes in groups, both to economize in work and prevent legal contests. They will not purchase from 20 claim-owners, some of whom will be sure to demand ten times the value of their property, but if they find one or two men controlling a series of promising claims which they can buy and test under a moderate outlay, they may be tempted to invest. The

time is past when a single undeveloped lode in an unproved belt can be sold at any price. In proposing this one-lode system Mr. Stewart seems to think that the locator is obtaining a \$20,000 gift from the Government, and to give him two or three times that sum is altogether too generous. If he knew or considered, however, that, except in rare instances, the claimant of mining ground may have to wait six, eight or even a dozen years before realizing anything from it, he would be more reasonable. Mr. Stewart ought to know that the prizes drawn by claim-owners do not exceed one to the hundred of blanks which amid great privations, disappointments and unrequited toil, are silently accepted as one of the contingencies of life. It is to the exploring skill and persevering work of trained and educated prospectors that we must look in the future for additions being made to the producing mines of the country. It is no longer possible for a "lucky tenderfoot" to stumble on a body of rich ore spread out on the surface for him to claim, and perhaps within a month to sell for a fortune. Since the days of speculation are over, prospecting for mineral lodes has become a legitimate business, in which the dissipated adventurer of early times can scarcely hope to succeed. The skilled prospector, like the inventor, creates something out of nothing. To hinder a locator from grasping his claims is simply putting a barrier in the way of future investors. To put him in subjection to a law which practically declares that when by years of persevering effort he has found a promising lode, he must be careful to give several loafers, who have been watching his operations, an opportunity to step forward at the right moment and claim extensions to his discovery, is neither wise nor just. The man who in a worthless mountain discovers a lode that in coming years will yield millions of dollars in bullion, is a benefactor to the world, and he deserves to be encouraged in making explorations by the right to locate all the claims he can work or utilize. Not one claim in a dozen proves of sufficient value, under the work that a prospector is able to do, to warrant him in holding it, unless he has the prospect of making a sale. As he is well aware of this fact at the outset, he wants to locate several claims, from which to select, after tests are made, the ones he will continue to hold.

The One-Lode Proviso.

But the Stewart one-lode proviso cannot be enforced. A discoverer will use the names of friends and locate as many claims as he desires. Is it wise to make laws that can be easily evaded? If adopted, it would in "faulted" or "dislocated" mining ground prove the cause of costly litigation. In such cases, and especially where the lodes do not appear boldly on the surface, it is very difficult to determine their true courses.

Suppose, then, a locator finds a vein seemingly running north and south and stakes it off, and later on finds another higher on the mountain which he also locates. He sells the first location for a small price so that he may be able to work on the other, which at a later date is bought by a second investor.

After years of outlay by two companies it is proved that the former is on a "slide," and both locations are on the same vein. Then will come a conflict in the courts, and experts will testify as to the "apex" of the lode lying within one set of surface lines, while its main body is elsewhere, but if a vein connection can be made from the first location, the owners of the second may lose everything. But why in the name of common sense should statutes be framed that can by any possibility bring about such contests? If Senator Stewart is disposed to argue that the contemplated change in the law would not have the effect described, he will in that fact prove that he does not possess sufficient practical knowledge on the subject to enable him to deal with it legislatively.

If his real object is to promote litigation, one can easily perceive how consistently he is striving to attain his end and understand also why he has disregarded every suggestion and warning he has received.

Relocating Forbidden.

The quotation already given from the Stewart bill forbids, as will be seen, the relocating of mining ground by any person who formerly owned it. In a mining camp which has been dead for years, it seems unreasonable to decree that an abandoned lode may be claimed by a prospector who never saw it before, while its original discoverer shall not be allowed to touch it. In such a case the lode had probably years before returned to the mineral domain, and having become free to all, why should the man who by reason of adversity or local depression was forced to let it go be excluded, when better times have come, from resuming possession?

If the Stewart law were in force it would be the cause of much mine-jumping and serious loss to the owners of imperfectly located lodes. It is often the case that uneducated men fail to describe their claims according to the law. Usually this defect is corrected when a survey for patent is made, but under the Stewart measure such a correction could not be effected. If it were enacted, steps would be taken to find flaws in the record notices of every mining claim of promise. Surely no equitable interest can be injured by giving the owners of each ground the right as they have at present to amend their location notices by re-recording.

The constant relocating of mining claims at the end of every year is an evil which ought to be stopped, but that can be readily done by

making it imperative that before a relocation could be recorded, an affidavit must be produced showing that a specified amount of work had been done. By doing such work beforehand, a defective location could be amended. If the owners of old locations found that relocating was nearly as expensive as holding them by work, it would soon be given up. This was one of the changes in the present law suggested by a PRESS correspondent to Mr. Stewart, but it did not suit his views. The enactment he suggests would leave matters just as they were before—the new law, if adopted, would be evaded by using the names of friends in relocations.

A Bad Change.

Section 2324 of the Revised Statutes is changed by the Stewart bill to read as follows: "All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location, and such a description of the claim or claims located as will identify the claim." In the mining law of 1872, the words "by reference to some natural object or permanent monument" are found after "claims located" in the above extract. It will thus be seen that Mr. Stewart seeks to do away with that clause in our present law which has made it impossible to perpetrate frauds by means of "floating" locations. Under the indefinite requirements of the law of 1866 as to locating mining grounds, it was an easy matter for rascals to assert and prove that some new and valuable discovery belonged to them.

On turning to the records, a claim in their names would be found, but its position not being stated, it would be used whenever its owners might declare the location was originally made. Prior to 1872, the locator of a promising lode was almost certain to find his title disputed by men who had never seen it before, and in one well-known case in Eureka, Nevada, a location was "floated" several miles, and in a costly suit the legitimate owners lost their property. What, then, can Senator Stewart's object be in proposing so to change the law that there will be no necessity for anchoring a claim down to some particular hill, as many feet or yards approximately from a peak, iron tower, spring or fork in a well-known ravine? Does he not here once more show that he wishes to promote litigation?

The vague language he substitutes for the present clear and entirely satisfactory requirement in locating a lode will not only admit of frauds being commenced again, but will seem to encourage them. Would not fraudulent locators always be ready to "identify" their claims? The great trouble 20 years ago was that "identification" was altogether too easy, and if Stewart's "amendment" is adopted it will become very easy once more.

The requirement in the Stewart measure that surface lines of a claim should be shown by posts or monuments would not remedy the evil, for false testimony as to these would always be available. Those of us who knew Attorney William M. Stewart contesting mining cases on the Comstock lode, nearly 30 years ago, are aware that he is fully alive to the importance of monuments when questions of identity come before judges and juries. Has not he heard of cases in those early days when men who had not been in the county more than three months could confidently testify that three years before they had seen certain disputed posts securely placed? In that part of his bill which describes how patents are to be obtained, Mr. Stewart makes it imperative that a lode should be described "with such reference to natural objects or permanent monuments as shall identify the claim and furnish an accurate description to be incorporated in the patent." He is willing, then, it appears, to let down the hare for unprincipled locators, but knowing that the hare must be up before a patent can be obtained, he lays the burden of descriptive accuracy on the mineral surveyor.

Senator Stewart's English.

It may seem ungrateful in a Western miner, for whose interest the Senator assumes he is legislatively doing so much, to take exception to the language used in his "finally perfected" mining bill. For purely philological purposes this time I copy again one of his cherished utterances: "All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location, and such a description of the claim or claims located as will identify the claim." The critical reader will not fail to notice how strangely these 36 words are flung together. They seem to suggest the idea that when they were lannohed into being they came in such a crowding, rampant way that it was impossible to marshal them in presentable files or to coax them into the places where they rightfully belonged.

A common writer not given to the building of wordy structures would probably have said: "Every record of a mining claim hereafter made shall give its date, the name of each locator, and such a description as shall identify it." The Senator, of course, would scorn to accept these 25 words as an improvement on his own flowing language, just as he spurned the mining suggestions which came to him from widely separated regions.

Very Vague Language.

Here is another proposed change in Section 2324 of the Revised Statutes: "Where several adjoining claims, not exceeding five, whether the same be lode or placer claims, are owned or held by the same person, association, or corporation, and the sum of \$1000 or more is expended

in any one year in good faith for the development of all of the claims so owned, or held, not exceeding five, there shall be no requirement for separate labor or improvements to be performed or made on the several claims so owned or held during such year." The above seems to be intended for the benefit of rich men. By expending \$200 for each claim in place of the \$100 required of common miners, the necessity for doing work on any of them is set aside. It is not said that a thousand dollars must be expended on the claims in actual work. If it is paid out "for" their development, that would suffice. Under this proviso a man owning five placer claims each of 160 acres might expend \$1000 a year on a dam ten miles away, from which in coming years he intended to bring water to develop them and would not be required to do local work, or if a person owned four lode claims on a mountain slope and had a placer location below them, \$800 of his outlay in extracting gold from the latter would count as the assessment for the former. At first it looks as if the measure related to a central tunnel, the opening of which would benefit all of the claims, but that cannot be what was intended, as there is a separate tunnel requirement in another part of the bill. Perhaps Mr. Stewart knows what he meant to say, but he certainly has failed to make his meaning plain to ordinary people.

But why should lode and placer claims be mixed up in this way for assessment purposes? There is nothing in common between them either as to the kind or value of the work to be done. And why should an outlay of \$200 on lode claims exempt their rich owners from surface work, while the poor miner who cannot expend \$1000 on his five claims must dig a \$100 hole on each of them? If this is not an attempt at special legislation, under what other name can it be designated? In his last year's bill our great law-giver named \$5000 as the sum that the owners of five claims were to disburse, but this year he reduced it to \$1000—being the only change effected in the measure.

It is a great advantage to the poor claim-owner that he is enabled now to concentrate his labor on several lodes on one or upon a central tunnel. Surface work done on lodes merely to comply with the law is in a great measure thrown away. It develops nothing, whereas the same labor applied to one lode may produce a paying property. It will be observed that whether Senator Stewart intended it or not, his contemplated change in the law, if success attends his efforts, will be a misfortune to the poor claim-holder. Is the liberality of our Government in mining laws to be suddenly withdrawn? And are the miners of the nation supple enough to allow the Nevada Senator to dictate and pass any kind of unreasonable or unjust law he may choose to frame, without a protest or an effort to frustrate his schemes? I believe they are capable of protecting their own interests as soon as they find that these are in peril.

JOHN DARE EMERLEY.

(Concluded next week.)

The Comstock Lode.

EDITORS PRESS:—The MINING AND SCIENTIFIC PRESS has been the only paper to give an intelligent description of the recent favorable prospect of the Comstock mines.

From personal observation and a careful study of the work in the different mines, I am not only able to verify what you have published, but also give the following additional information which will unquestionably prove of interest at this time:

The west wall of the ledge found in the Hale and Norcross mine, and the continuation of which is now being opened up in the Potosi, takes a sharp bend to the west (about 200 feet south of the first-named mine), in the Chollar mine's ground. For the past 15 years, all the Gold Hill mines south of that bend have been prospecting to the east and far away from this particular location. The practical demonstration of a sharp bend in the west ledge is found in the Alpha-Exchequer west drift, 500 foot level, where the west ledge, 60 feet in width, has been exposed. The Alpha Mining Co.'s shaft is several hundred feet west of the Bullion and Con. Imperial Mining Companies' shafts; therefore from the east workings of these mines in Gold Hill to the west ledge, it must be all of from 1000 to 1500 feet. In the Belcher mine, still farther south and 500 feet west of their former workings, they report the finding of this ledge, wherein 40 or more feet of fine mineral-bearing quartz is exposed.

In the face of these facts, a majority of the California press is devoting its columns to attract the attention of stockholders from the truth by holding the Con. Virginia mine up as an object-lesson, and at the same time showing the impossibility of the mine paying many more dividends. There are other mines on the Comstock that will be proven rich in mineral ore as prospecting work is prosecuted in the great basin lying west of the Gold Hill mines, extending from the bend in the Chollar mine to the Overman mine south. The ore in this ledge ranges from 60 to 90 per cent in gold. This by practical mining men is considered the most important discovery that has been made since 1871, when Senator James G. Fair ran his prospecting drift through the Gould and Curry mine and discovered the ore body or bonanza in the Consolidated Virgins.

MINING ENGINEER.

Virginia, Nev., March 23d.

Trusts and Futures.

The Hon. B. A. Eoloe, of Tennessee, has kindly sent us a copy of his timely and excellent speech in the House of Representatives, on the resolution proposing an amendment of the Constitution for the suppression of trusts and gambling contracts in agricultural and other productions. The measure has so largely attracted the attention of the farmers and laboring classes, that Congress ordered the printing of a large amount of extra copies, to supply the demand. A bill was introduced during the first session of the Fiftyeth Congress, for the suppression of option dealing, and was referred to the Committee on Agriculture. It was found on investigation that Congress could not interfere in such cases without disturbing the stability of contracts. The only clause in the Constitution that permitted an approach to this sort of legislation was the clause under which the Interstate Commerce law was enacted, and that was thought to be too vague and shadowy for Congress to enter this domain of contracts. Hence the bill was reported adversely. The pending resolution proposes to reach and cure this evil by an amendment to the Constitution. Mr. Eoloe says:

"My reason for embracing trusts and other similar combinations in the same amendment will be found in the fact that the two evils have their origin in contracts of the same general character. Combinations to limit the production and to fix the prices of commodities, combinations to arbitrarily fix the supply and the prices of labor, and combinations to control markets, all rest on the same footing and have a common origin with option dealing. They all originate from contracts which are illegal and contrary to public policy, contracts which give birth to great and powerful enemies to the public interests."

It would seem that the safest, enrest, and most direct channel for public opinion to take in suppressing the enormous evils of trusts and option dealing is along the line of Constitutional Amendment. Other remedies are doubtful and may lead to interminable litigation. This lays the axe at the root of the tree. The demand for this kind of radical remedy is emphasized by the platform of both parties. It is voiced by public speakers of all shades of political opinion. The press is practically a unit on the subject. "For Congress to refuse to take any action in this matter," says Mr. Eoloe, "would be to plead guilty to a degree of political hypocrisy and demagoguery which would go far to destroy the confidence of the people in the good faith and integrity of their representatives."

The demand for relief from the destructive influences of gambling contracts in agricultural products is most emphatic. It comes from the farmers and laborers. It comes from the producers; from the bone and sinew of the country. It comes from those who contribute most largely to the support of the Government. Organized labor, in the shape of the State and National Grange and in the great convention recently held in St. Louis by the farmers of the West and South, have emphatically demanded that Congress shall take immediate steps to suppress dealing in futures.

While all admit this evil and the urgency of some sort of remedy, there may be a few who fear that a constitutional amendment may tend to the centralization of power in the Federal Government. The ghost of Thomas Jefferson rises before them; but this country has grown immensely since his day. This great statesman in the wildest flights of his imagination never dreamed of such a thing as an Interstate commission coming in to regulate the vast commerce of 60,000,000 of people, over 150,000 miles of railroad traversing every State in the Union and welding them together with bands of steel. It never occurred to him that a time would come when through the agency of electricity the people in Washington and New York would hold a conversation in less time than he could ride from the White House to the Capitol. Had he caught a politician talking to a phonograph, he would have thought him a fit subject for the lunatic asylum. It never occurred to his fertile brain that there would come a time when men in New York and Chicago would become millionaires dealing in crops before they were planted, selling property they never owned, selling the property of other people without their consent, selling millions of dollars worth of property more than the whole country annually produced. It never occurred to him that a time would come when favoritism would control legislation in the interests of capitalist classes to such an extent that transportation, the manufactures, the sale of agricultural products, would be concentrated in trusts, combines and other monopolies, and the prices of labor and products arbitrarily fixed by the caprice of a greedy, selfish syndicate.

Men who claim to be statesmen will attempt to silence the complaints of the people by word-pictures of the unexampled prosperity of the country. In the closing words of Mr. Eoloe's speech:

"Pictures of the nation's prosperity painted in the most glowing colors will not lift the mortgage from the farm nor feed and clothe the wife and children. There is no disguising the fact that millions of American laborers stand like Tantalus surrounded by fruits and flowers of a nation's prosperity which they can neither touch nor taste, up to their necks in streams of

national prosperity from which they may not drink.

"Everything they touch turns to gold, and many of them, like Midas of old, are starving in the midst of the wealth which their magic touch has created. Long arrays of figures to prove the prosperity of the nation will not appease the pangs of hunger nor shut out the cold blasts of winter. If you would lighten the burdens of labor and smooth the wrinkled foreheads of men from the brow of labor, if you would nerve the arm of the toiler which is well-nigh paralyzed by the oft-repeated disappointment of false hopes inspired by the false promises of false teachers, if you would restore the prosperity of the masses, take the hands of the robbers, created by class legislation, out of the pockets of those who toll; make the classes who are riding the tax-payers, hooted and spurred, get down and walk; stop piling burdens on industry for the benefit of those who neither toil nor spin; blot out from the face of the earth the trusts and monopolies that grind the faces of the poor, and force the dealers in 'wind' to live on the wind or work for an honest living."

Car and Battery Assays.

The officers of the Mining Stock Association have written the following letter:

The Mining Stock Association of this city has been endeavoring for some time past to induce the various ore-producing mining corporations of the Comstock to publish a full statement of the value of the ore produced. This can easily be done by giving the car assay value as the ore comes from the mine, and the pulp assay at the battery of the mill.

As these assays are always made by each ore-producing mine, there would be no additional expense incurred, and the information so given would be a source of the greatest value and satisfaction to stockholders. There certainly can be no objection to the publishing of these facts, viz.: the car assay of the ore produced and the pulp assay. No honorable mine manager would decline to do so. That it is not already done by all the ore-producing companies is undoubtedly due to inattention, as the subject is of too much importance to be omitted intentionally by any honest mining corporation.

It is worthy of notice in this connection that the Overman Mining Company, in their report for the week ending March 8th, give both car and battery assays, and the management deserve commendation for so doing. It is true that it is a new departure, but one that all ore-producing companies should follow.

The business of dealing in mining shares has shrunk to such a point that it has become unprofitable. Any change or reform that would benefit and increase the business should be looked upon with favor by both mining-stock holders. We believe that the publishing of the facts mentioned in reference to the ore produced would tend toward regaining the confidence of the speculative public.

We would suggest that both mining-stock boards make it imperative for all mines listed to publish the two assays mentioned of all ore produced.

CON CALIFORNIA AND VIRGINIA.—The official returns of the ore crushed and bullion produced for account of the Consolidated California and Virginia mine for the month of February have been received. There was worked at the Morgan mill 3480 tons of ore, yielding bullion of the assay value of \$73,883.79, of which \$38,528.52 was gold and \$35,355.27 was silver. The average yield in bullion per ton was \$21.23, and the assay value of the ore per ton was \$21.04. There was worked at the Eureka mill 5800 tons of ore, yielding bullion of the assay value of \$128,149.42, of which \$68,380.44 was gold and \$59,768.98 was silver. The average yield per ton in bullion was \$22.09, and the average assay value of the ore per ton for battery samples was \$26.05. There was worked at both mills a total of 9280 tons of ore, yielding bullion of the assay value of \$202,033.21, of which \$106,908.06 was gold and \$95,125.15 was silver. The average yield in bullion per ton was \$21.77, and the average assay value of the ore per ton was \$26.98.

GOLD QUARTZ MINING.—More prospecting and mining is being done here this winter than for years. Spenceville and the adjoining vicinity north of it is certainly situated in a very rich mineral belt, but you will find some unscrupulous persons who are ready to swear mineral off of any section of land the railroad company may wish to acquire a patent for, and to-day they and their agents are attempting to get control of a piece of land here on which three different mines are in active operation, and others will be worked as soon as the weather will permit. It appears that it is about time for people who are interested in mines and mining to do something for themselves and prevent mineral lands from passing into hands that will forever forbid the development of the mining interests of this county. If mining men have been asleep, the Eagle Bird decision should have awakened them to the fact that this particular interest should be vigilantly watched now and attended to, and not when it is too late.—*Grass Valley Tidings.*

AFTER seven years, a number of Bodie miners have received money due them for work on the Noondays. Patrick Reddy and Wm. H. Virden have credit for pushing the claims.

Coast Industrial Notes.

WORK on the Stanford University has stopped for the present.

The contract for carrying mails on Lake Tahoe has been awarded to E. J. Baldwin of San Francisco. He has ordered a fast steamer built at Buffalo, N. Y., for this purpose, and it will also carry passengers to all points of interest.

A SURVEYING PARTY of ten men, with three carloads of material comprising camp and grading outfits, has been sent from Stockton to Oakdale to begin the work of extending the Oakdale road from Oakdale to Merced, a distance of 40 miles. It is expected that 400 laborers will be put to work in a few days.

The construction department of the Southern Pacific Co. will overhaul the snow-shed system along the mountain road this summer. Much of the present shedding will be torn down and done away with altogether, while that which remains will be strengthened and strongly braced with steel and iron rods. New snow-plows to make the total in use ten will be placed along the road.

THERE is quite a number of vessels fitting out for Alaska to engage in the salmon-fishing business. The Alaska Commercial Company's steamers Bartha, Dora and St. Paul have been brought to the city and will be overhauled and loaded, and will leave for the north in about a week. Business is comparatively brisk along the water-front, and every vessel which leaves takes away a number of men, both white and Chinese, for cannery work.

WORK is to be commenced shortly upon the plant for an extensive sulphur refinery, which is to be located in North Oakland, near Shell Monnd Park, in the building formerly occupied by the antimony works. The building is 60x100, and a new addition 30x30 feet, which it is expected will be completed within two weeks. The machinery is being manufactured at the Oakland Iron Works in this city. The process is a new one, invented by Bowen & Co. The works will be operated by Sherwood & Sherwood of San Francisco.

OUR California trade with the Pacific Islands is quite large. In February our export trade with the Hawaiian group amounted to \$302,526; Figo, \$222; Simon, \$303; Philippines, \$227; Society, \$53,250; Marquesas, \$3236. Total, \$369,495. The increase this year over last is \$128,743. For the two months of this year our imports, mainly sugar, were valued at \$1,359,039. The combined movement, sail and steam, shows a total of 33 vessels and of tonnage 20,872 employed during the past two months in the Hawaiian trade.

COLONEL WALTER S. MOORE, chairman of the State Board of Forestry, has returned from a visit to the Chico Forestry Station, the land for which was donated by General John Bidwell, and which he states is in fine condition. The board is especially interested in the Australian wattle, which is used in tanning, and which, it is thought, will in time take the place of the tan bark oak, now very nearly exterminated. A ton of wattle bark equals six tons of oak bark, and the trees are ready for stripping at four years of age. Colonel Moore thinks they will prove of incalculable advantage to California in the near future. One great peculiarity about the wattle is that stripping does not kill it, because in a short time a new bark is formed.

THE thickest and at the same time the heaviest leather ever seen in this market, or in all probability in any market in the world, has been received by S. H. Frank & Co. from their tannery in Ridwood City, and created much comment among those interested in that commodity. The hides come from cattle in the northern part of the State, and although not unusual as regards size, were remarkably thick and heavy. It required eight months to tan, and the enormous gain of 75 per cent during the process was noted, the usual gain being about 65 per cent. The sides of tanned leather are double the thickness of ordinary sole leather, and weigh from 50 to 60 pounds each. The rolls in which they are done up weigh from 448 to 504 pounds. It was the opinion of all who examined this leather that it was in all respects the most remarkable ever seen here or anywhere else in the United States, and was one of the unique productions of California.

DURING his visit East, Marsden Manson, engineer of the Harbor Commission, will visit Perth Amboy, N. J., for the purpose of thoroughly inspecting the creosote works at that place for the information of the Commissioners. The ravages of the teredo and limnoria necessitate the expenditure of large sums of money annually in repairing wharves, as the insects destroy sound piles within a very few years. A process of inserting a preparation of creosote into the piles is a preventive of the inroads of the little pests, and the Board of Harbor Commissioners look forward to a time when a wharf will stand for a very long time without having its foundation destroyed. Commissioner Alexander says the board has not yet decided to construct works here, but will, in all probability, do so, should Manson's report be favorable. "We want him to learn what the process is and whether we can put works up here with reasonable expectation of success. If we can, we will do it. It will probably cost about \$100,000, but the saving in repairing will be enormous. There is an Act of the Legislature empowering the board to proceed."

SECRETARY WINDOM has made public the exact terms of the lease to the North American

Commercial Co. for a term of 20 years from May 1, 1890, of the exclusive right to engage in the business of taking fur seals off the islands of St. George and St. Paul in the Territory of Alaska and to send a vessel or vessels to said islands for the skins of such seals. The company agrees to pay an annual rental of \$60,000, a tax of \$9 62½ on each skio taken and shipped, and 50 cents for each gallon of oil sold. The company is to deposit United States bonds of \$50,000 face value as security for the rental. It is to furnish to the natives such quantity of dried salmon, salt and salt barrels as the Secretary of the Treasury shall determine, 80 tons of coal annually, comfortable dwellings, to be kept in proper repair, schoolhouses, and competent teachers eight months in each year, a house for religious worship, physicians and medical supplies, and all the necessaries of life for widows and orphans and the aged and infirm. The company is to furnish the natives employment, and to give them just compensation therefor, and hinder itself to abide by the regulations of the Treasury Department and any limitations on the right to kill seals that the Secretary of the Treasury shall judge necessary under the law for the preservation of the seal fisheries. The number to be killed during the first year is not to exceed 60,000. The agents of the company are not to keep, sell, give or dispose of liquors to the Indians.

THIS winter has been a severe one for those loggers and wood-outfitters who have made their homes in the deep woods for the purpose of cutting sawlogs and railroad wood. The *Truckee Republican* says: The severe storms have impeded operations in the line very seriously. A man who, with eight others, has been snowed in at the Truckee Lumber Company's logging-camp, came to town this week. The camp is located in a pretty gulch about nine miles from town, or rather the spot is pretty in the summer-time but now it is filled with snow. Their cabin is completely buried. During the storms, every morning it used to take several hours to dig out. In starting a fire it would be necessary to run a pole up the stovepipe through the snow, so that the smoke could escape. The upper extension of the flue was solid snow, and was several feet long. The snow was so deep that it was very difficult to cut trees. To cut them while standing on top of the snow means a loss of a log at least 16 feet long, containing the best timber in the tree, so that it was necessary to shovel out each tree. The men have got in but ten days' work since the first of December, which is not enough to pay for grub. They will be mighty thankful to have spring come.

THE OLD FORTUNE-MAKER.—What a marvelous piece of property the old Comstock lode is, says the *Virginia City Chronicle*. The daily bullion yield of that lode is fully \$20,000, which will be somewhat increased toward summer, and the yield for the current year will not run far from \$8,000,000. It is deep mining that has made the Comstock what it is, and it has always been claimed by the old miners of Nevada that deep mining would make Colorado properties pay where surface gougering would only result in a loss to those who conducted such operations. The "big bonanza" was found in the 1700 foot level of the California and Consolidated Virginia, and in the space of a few weeks made several Californians many times millionaires. In Colorado 300 or 400 feet is considered a great depth, and the mines that have a greater depth are comparatively few. To successfully work a mine 1000 or more feet deep, requires expensive machinery and heavy capital, but there is every reason to believe deep mining would be attended with quite as much success as it has been in Nevada. It would be interesting to see what one of the great veins of the San Juan or the Aspen district would yield at a depth of 1500 feet, and the time is coming when mining men will have to determine this question.—*Denver Tribune.*

DEEP CROSSCUTS AT BUTTE.—The large silver mines and many other similar ones at Butte, Montana, are crosscutting at their deepest levels, the Alice at the 1200 and the Lexington at what is called the 1500. The East Gray Rock has also completed its shaft to the 500; and the crosscut is in a distance of 100 feet toward the ledge. Mining generally throughout the camp is just only starting on a boom, and in a few months the hills will be dotted with the many leasers and prospectors who are only waiting the coming of warm weather that they may shake off the idleness of winter and get out and rustle.

SMELTERS WANTED.—What is needed in this camp is larger smelters and more of them to dispose of the quantities of ore abounding in the district. Hardly is there a hole sunk without cutting new properties, and none but what contain mineral in paying quantities. Of course on the surface some are found that are not profitable, but give them depth, and in very few instances have they failed to materialize. Years hence this mining district will not be even prospected. Summit Valley mining district is indeed the greatest mining district in the world to-day, and it is only in its infancy.—*Butte Inter-Mountain.*

THE compromise between the Dexter and Elra Companies, at Tascara, Nev., will cause continuance of work in two claims which otherwise would probably have been suspended for several months.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR GOLD MINE.—Amador Ledger, March 22: All financial troubles with the miners at the Amador gold mine have been satisfactorily adjusted. All the men who would accept nothing less than the full amount coming to them, were paid off in full on Saturday last. Others who were paid a part, and were willing to wait a few days for the balance, were to be paid all that was due them this week. No work to speak of is being done at the mine; but there is no question it will start in good shape before long. It is the intention of the management to avoid all trouble concerning the wages of employees in future. They will always have sufficient funds in reserve to meet a month's wages. The suit between W. Doyle and the company concerning the track from the mine to the mill has been compromised. The company, we understand, pays the plaintiff \$2000 for permission to allow the track to remain where it now is, merely straightening it near the mill. By this arrangement both sides are satisfied.

DRYTOWN.—The Cosmopolitan mill is at present at a standstill. Contracts were let to run two drifts, each 200 feet in length in the mine. Fred Bochers, Walter Tibbits, Nick Vegas and Henry Dickerman were awarded the contracts. Considerable work is being done at the North Gorge, but somewhat under difficulties on account of the weather and the bad condition of the roads.

SUTTER CREEK.—The new seven-eighths wire rope has been received at the North Star and is already on the sheave. It is 1200 feet long and will permit of sinking 200 feet deeper, which is as far as the management will care to go. Sinking has not commenced as yet, as it is the intention to prospect the 800-foot level before abandoning it, and this will take a week more yet. Operations at the Lincoln, Sutter Creek and South Eureka mines are still retarded on account of the weather. The Wildman is running along in its usual style, and is said to be improving all the time. C. O. Mitchell has secured a contract to make 600 feet of 8-inch pipe to be used as air-pipe at the South Spring Hill mine.

Calaveras.

TULLOCH AND LANE.—Mountain Echo, March 19: We were down to the Tulloch & Lane mine this week, and had an opportunity of seeing for ourselves everything that was to be seen. The mine is looking remarkably well, and carries a splendid quality of sulphurets. The Tulloch Sulphurets Concentrator, invented by James Tulloch of Angels, is concentrating the material from five stamps and can yet do greater work. We unite with the opinion of experts who have examined it and pronounce it the best sulphurets concentrator extant. Its work is effective, positive and final, and its cost is much less than the Frue.

SULPHURETS.—We learn that E. W. Peet of this town has just completed the erection of a sulphurets process, at a point where the Gold Cliff sands empty into Angels creek. This process consists of a large floor covered with canvas, through which flow the water and sands. By the laws of specific gravity, the sulphurets settle in the interstices, where after considerable of a deposit the water is turned off and the concentrations collected. Mr. Peet will also construct a like process below the Tulloch mine.

GOOD MINE.—The Whittle mine, situated some three or four miles southwest of this town, is giving an excellent account of itself. Mr. Peet, the present proprietor, says that he has crushed several hundred tons of the ore with his little mill and none of it yielded less than 59 per ton. The main shaft is over 200 feet deep, and the vein at the bottom ranges from two to three feet in width.

UNION SHAFT MINE.—Prospect, March 22: Another engine has been added to the machinery now in operation at this mine. It is intended, we believe, to use one engine for hoisting purposes and the other as a pump.

LOOMING UP.—The Meteor quartz mine, near Washington ranch, is developing well. One of the owners, Mr. Byroo Swank, is hopeful of an excellent showing in the future.

SMELTING WORKS.—The smelting works at Copopolis will be completed about the first of April. Mr. Person, the Supt., expects to put on about 100 more hands in and around the mine after that time.

Humboldt.

FROM ORLEANS BAR.—Blue Lake Advocate, March 15: From Mr. Ottley, just from there, are learned some interesting facts. He says the long and severe storm has so broken up the mining that there will be but little done this season. The Orleans Bar M. Co. has discharged all the hands, and will work no more this season. Most of the other smaller mines are all broken up. A few small claims are not badly hurt. The floods and landslides have changed the whole face of the country.

Mariposa.

JOSEPHINE.—Mariposa Gazette, March 22: There are rumors of a big mill soon to be built at the Josephine mine, at Bear Valley, with a tramway to the river, and with the usual 100 stamps filling the air with the music that is so sweet to people living in a mining community. What good news it would be if that report should be verified.

DILTZ.—Capt. Diltz and George Stewart are quietly and steadily working away at the Diltz mine. They are uncovering a fine vein, which promises well for a big yield of gold. They also expect good pay from their sluices.

Nevada.

NORTH BANNER.—Grass Valley Union, March 20: Operations at the North Banner mine are going on regularly now, both in the mine and mill. The drain tunnel is running out a big head of water that comes from the surface, but below the tunnel the pump handles the water easily.

STRIKE AT THE WASHINGTON.—Transcript, March 19: Supt. Tregidgo, who is temporarily sojourning in this city, has received a letter stating that on Saturday last a large and rich body of ore had been developed in the 300-foot south drift of the Washington mine at Ormonde, and on Monday the ledge was opened up sufficiently to show it is eight feet thick and carries lots of gold.

PEABODY.—Grass Valley Union, March 22: The

intention was to start up work on the Peabody mine the first of this week, but the stormy weather prevented, but as soon as it is evident that the storms are over, operations will be commenced and carried on regularly. It is the intention of the Nevada County Development and Improvement Co., which has a hood on the property, to put down the shaft 500 feet, and open up levels for the exploitation of the mine, in order to thoroughly develop the property.

DELHI MINE.—Nevada Herald, March 21: On account of the snow, work at the Delhi mine was suspended, except in running the tunnel, some two months since. Supt. Chris Mallon visited there yesterday and says operations will soon be recommenced. Men are now engaged in putting in an air-compressor at the lower tunnel for running the same. The mouth of this tunnel is 80 feet above the river. It will be 1000 feet before the ledge will be struck, and the point reached will be 400 feet vertical depth below the present workings of the mine. It is intended to put the mill below the mouth of this tunnel, down near the banks of the Middle Yuba river. Power for running the compressor will come from the water running out of No. 3 tunnel, which will give 350 feet pressure. The Delhi has a great record, but its past achievements will be nothing as compared with the future, if the ledge is found of the same size and richness below that it has been above, where worked.

San Luis Obispo.

BITUMINOUS ROCK.—San Luis Tribune, March 22: Orders were received Tuesday at the bituminous rock mines, of which Mr. McCormack is superintendent, for 450 tons for immediate shipment, making about 1500 tons forwarded since the season opened. Prospects are good for rapidly increasing business at the mine this spring, with every indication that the statement that the Pacific Coast railway would be unequal to the demands upon it this year, will be more than justified.

Sierra.

GOLD BULLION.—Oroville Mercury, March 21: J. H. Frissell, D. Moore and W. E. Gillon arrived in Oroville from the Union Consolidated drift mine in Sierra county, with \$23,000 in gold bullion, the result of a two-months' run. Last December this mine also made a heavy shipment, and it is paying handsomely. It is worked constantly and employs from 70 to 100 men.

Siskiyou.

GRAVEL AND QUARTZ.—Yreka Journal, March 19: Jillsco & Co., at Henley, are busy uncovering the blue gravel lead, by piping day and night, with an abundance of water in their ditch for the purpose, and will soon be able to realize good pay in washing up the rich bedrock gravel. Thornton Thomas, I. G. Blessing and Mr. Yard struck an extraordinary rich pocket of quartz in Humburg Gulch, just above Yreka Flats, which paid \$200 to a half-day's work of pounding in a mortar. They expect it will pay still richer below the surface croppings and may develop into a permanent lode. We were shown specimens which contained free gold in large quantity, and about the richest we have ever seen from any ledge. Mr. J. W. Yard, one of the finders of the above ledge, called to see us again yesterday, and showed us more specimens secured about a foot beneath the surface, being almost solid gold, with but little quartz. From present indications the ledge opens like pocket seams, although the finders have great faith in its permanency. The ledge is located behind the old Joe Lang cabin, about a mile and a half west of Yreka, in Humburg Gulch, and should it prove a permanent ledge, we may anticipate the finding of several more rich ledges in the entire Humburg range of mountains along the west side of Yreka basin. The Big Ditch is now in good repair and running banks full with water, enabling the miners at Hawkinsville and on Yreka Flats to carry on mining extensively with the greatest success. The prospects of the best times in Yreka since 1855-6 is anticipated, as every paying claim can now be worked to good advantage. Cobb McManus, Royal Brown and others have cleared off considerable top ground from their claim at Spring gulch, just above town, realizing good wages from the surface, while the bedrock gravel remaining when water for ground-sluicing slacks up, will pay very richly with a small head for the sluice-boxes.

SAWYER'S BAR.—Yreka Union, March 20: Down here in a remote, mountainous region in the southern portion of Siskiyou county, there exists a mining field which in the near future is destined to attract considerable attention from the mining fraternity, as there have recently been discovered several quartz mines that deserve more than passing notice, one of which promises to rank among the leading gold producers of the State, and of which little has been learned owing to the reticence of its owners and operators. The Gold Ball Mining Co., of Canton, Ohio. This interesting piece of property is about three miles south of Sawyer's Bar, at the head of Eddy's gulch, which is a tributary of the north fork of Salmon river, and in the Klamath basin. The Gold Ball mine is probably a continuation of the old Klamath vein and its development has shown sufficient to entitle it to be classed among the bonanzas of the State. Work is carried on under the able supervision of Mr. Ball of Canton, Ohio. The Black Bear mine, famous in the early days of quartz mining in California, from the millions it then produced, is on the eve of returning to active operations, and again entering the list of paying gold mines, for which all credit is due Mr. John Daggett, in proving the existence of supposed rich ore chimneys. The Uncle Sam has been a paying property for many years under the management of Mr. Ed Sheffield; it is a large vein of soft decomposed quartz of a good grade, can be mined and milled cheaply and in large quantities, consequently it is a very profitable mine, and in the hands of parties prepared to operate it more extensively would become one of the foremost producers in the county. The Portuguese mine, as it is commonly called, is owned and operated by Rollin Fagundes and his partner; it is a little bonanza in itself, they having purchased it for a nominal sum when but a small insignificant seam of quartz was opened up, which by further development increased into a foot or more of soft decomposed quartz, thoroughly impregnated with the yellow stuff. These two energetic prospectors by their own labor last season produced \$12,000 from 250 tons of rock crushed in an arrastra; this season will show a product double that amount from about the same amount of quartz. The Little Boss mine, discovered last season, is a

parallel vein to and close by the old Klamath; it is small but very rich and promises to yield a small fortune to its owner, Ned Roberts. The Mistletoe, owned by Frank Golden and Tom Evelett, promises to develop into a mine of no small proportions. They have an ore chute of considerable length exposed, showing a width of five feet on an average, from which 40 tons of ore packed to the Black Bear mill last season, for a test, yielded \$22.50 per ton. The Sunday Morning lode, discovered last season by Probasco, Welker and Stent, has been penetrated by tunnel and shaft to a considerable depth, showing a fissure vein of soft decomposed quartz of high grade. These flattering properties, with many others that space will not at present permit of mention, are located near the old placer-mining camp of Sawyer's bar, and promise to open up an inviting field for both prospector and capitalist, especially the prospector, who, with a little muscle and energy to hack him, stands a chance unequalled anywhere in the mining regions of striking a prospect of value which he can develop without the assistance of capital, as the veins are soft and decomposed to a considerable depth, as is also the formation through which they run, with the gold perfectly free in the quartz, and the facilities in the way of wood, water, etc., all that could be desired, allowing one to work his find by the simplest methods, the most essential article being muscle, backed by pluck and energy.

ENCOURAGING.—Yreka Union, March 20: The mining industry appears to be looming up in all parts of the county, the hountiful supply of water making it practicable to work in localities where heretofore it had been impossible. Encouraging reports are being received from the Hooperville, Scott Bar and other regions where mining is the principal industry.

NEVADA.

Washos District.

ALTA.—Virginia Enterprise, March 22: Owing to break in water pipe, the mill was shut down a few days, but work has since been resumed and are crushing about 45 tons daily.

YELLOW JACKET.—Shipping about 65 tons of ore daily of the average value of about \$20 a ton to the Brunswick mill.

CON. IMPERIAL.—West crosscut No. 2 from the 300 level north drift (Yellow Jacket), which is the 500 level of the Imperial, is now out 155 feet, having been advanced 5 feet during the week. The face shows porphyry. West crosscut No. 1 from the 500 level north drift (Yellow Jacket), which is the 750 level of the Imperial, is now out 252 feet, 7 feet having been added during the week. The face is in a mixture of quartz and porphyry. West crosscut No. 2 from the same north drift is out 140 feet, 35 feet having been added during the week. The face of this crosscut is also in quartz and porphyry, and the north lateral drift No. 1 on the same level is in 45 feet, 28 feet having been added during the week. The face shows quartz and porphyry.

CONFIDENCE & CHALLENGE CON.—The joint Confidence & Challenge west crosscut from the 300 level drift has been stopped for the present.

CROWN POINT.—The 100 raise is up 20 feet above the track floor and still shows a streak of good ore in the top. The 300 south slope on the ninth floor has improved somewhat during the week in going south. Shipped to the mill during the week 846 tons of ore, the average battery samples of which were \$17.45 per ton.

BELCHER.—The 200 level south drift from the west crosscut is out 54 feet. The face is in low-grade quartz. The joint 850 crosscut is out 255 feet, and the face is in porphyry and clay. Started a southeast drift from No. 2 crosscut on the 1000 level, which is out 35 feet, or about up to the south line.

OVERMAN.—From the 1200 level have extracted and hoisted 202 tons of ore. Car sample assays average \$16.78 per ton. Of this amount \$10.50 is gold. Shipped to the Vivian mill 319 tons. Battery average \$17.60 per ton, of which \$8.50 is gold. On the 1200 level the northwest drift from the northeast drift has been extended 9 feet through good ore; total length, 52 feet. On the 54-foot level above the 1200 level have extended incline upraise 15 feet through ore of a fair grade. Total length, 49 feet.

POTOSI.—The east crosscut, 300 feet south of north line, 850 level, is out 50 feet; face in porphyry. The raise 400 feet south of the Chollar shaft, 950 level, is up 59 feet. The roof is in quartz giving assays of from \$30 to \$40 a ton.

EXCHEQUER.—The east crosscut on the north line, 500 level, is out 140 feet; face in porphyry.

ALPHA.—West crosscut, 100 feet north of shaft, 500 level, is out 510 feet; face in hard porphyry. North lateral drift, 600 level, is out 180 feet; face in porphyry streaked with quartz.

SILVER HILL.—Northeast crosscut, 260 level, from the northwest drift, 430 feet from the shaft, was driven 20 feet through porphyry; total distance, 595 feet. Repairing northeast crosscut on the 160 level.

SCORPION.—On the 630 level they have started a southwest drift from the shaft station and advanced the same 35 feet.

HALE & NORCROSS.—On the 300 level the north drift was extended 20 feet; total length, 45 feet. The north upraise, 800 level, was advanced 25 feet and connected with the 700 level north drift. This connection improves the ventilation and facilitates the working of this part of the mine. Will soon be ready to extract a great deal of ore from this raise. Have started a southeast drift on the 1300 level to explore the downward continuation of this ore. Milled 800 tons of ore during the week, the average assay of the battery samples of which was \$19 a ton. Have bullion on hand and at the mill amounting to \$17,914.80.

SAVAGE.—On the 300 level the north and south lateral drifts were advanced 8 feet and 17 feet respectively, the total length of the former being 39 feet and of the latter 101 feet. Are extracting ore from the 400, 500 and 600 levels, and from the old stopes on the 750 level. Milled 455 tons of ore during the week, the average assay value of the battery samples of which was \$20.52 per ton. Have bullion on hand and at the mill amounting to \$16,203.20.

ANDES.—During the past week drifted northeast from 10 feet west of shaft, 420 level, 15 feet. Formation, clay and porphyry, with seams of quartz.

Ely District.

NO MINERS WANTED.—White Pine News, March 15: There is yet nothing going on in this

district to warrant an influx of miners or laborers. It is true our own people are busy developing their mines, but they have not the means to employ outside help. Until some organized company starts operations there will be no work for miners or laborers from abroad.

Groom District.

ORE.—Pioche Record, March 15: Groom district is situated about 35 miles southwest of Hiko, or from Pioche about 100 miles in a direction a little south of west. The one developed ledge of Groom runs north and south, dipping east at an angle of about 80 degrees. It lies between lime and slate. A range of quartzite hills runs parallel with the ledge at a distance from it of about half a mile. The ledge croppings are large and prominent, and there were found in them occasional pockets of highly-metallic ore. A chimney containing a considerable body of similar ore was found at a depth of about 100 feet. Five or six hundred tons were taken out and remain on the dump, being too low grade—about 20 oz. per ton silver and 30 to 40 per cent lead—to work without railway facilities for transportation, either of the ore or of its product. Two shafts have been sunk on the ledge, 200 feet apart. One is about 175 feet in depth, and the other, perhaps, 100. These shafts are connected by drifts.

Jackrabbit District.

DAY MINE SOLD.—Pioche Record, March 15: It is reported on good authority that W. S. Godbe has purchased all the property in this county of the Day Silver Mining Co. This embraces the Day and Junction mines in Jackrabbit district, the Mendha and Hamburg mines in Highland district, the Hillside mine in Bristol district, and the old smelter at Bristol. The purchase price was not directly mentioned, but it is said to be \$30,000.

Jumbo District.

PANDORA.—Virginia Chronicle, March 18: The owners of mining locations in Jumbo district will resume the work of development as soon as the road is open for the delivery of supplies. The extraction of ore from the Pandora was continued through the winter months, and there is now a large amount ready for transportation to the Fisher mill in Six mile canyon.

Robinson District.

THE PURCELL MINES.—Eureka Sentinel, March 15: In view of the proposed sale of the mill plant at Seligman, we presume no further efforts will be made to develop the Purcell series of mines unless they change hands. It would be a matter of regret should the property remain idle after so much money has been spent upon it. The vein of the Purcell mines can be definitely traced for miles, and if developed in a systematic manner, the richer chutes of ore be followed and the poorer gangue be left in place to hold up the ground, there is little doubt but the mines can be made to pay. This is the opinion of the better class of miners who have worked in various places on the vein. The big tunnel at the concentrator level is already in 900 feet, and has only 1300 feet farther to run to tap the vein 1750 feet deep. There are Burleighs, compressors and all other necessary equipments on the ground, and should the capital necessary to complete the work be applied for that purpose, there are no visible reasons why the mines should not pay well. The ground in the tunnel is favorable for driving and will probably not cost to exceed \$8 per foot to run it. There is a full water supply at Seligman for all reasonable purposes, and this can no doubt be greatly increased by driving a tunnel through the porphyry under the bed of the southerly branch of the canyon, which, on account of the easy working nature of the ground, can be speedily done at a comparatively trifling cost.

THE MILLING PLANT.—We learn that negotiations are pending between the Kansas Co. with J. N. Hodges at the head and Mrs. Robinson, for the purchase of the Seligman milling plant, with the view of having it removed and put up in this district.

Southeastern District.

MINERAL.—Pioche Record, March 15: Southeastern district is about 15 miles southeast of Groom. In this district may be seen an immense amount of mineral, perhaps more on the surface than in any other portion of this great county. The ore is low grade, not over \$25 to \$30 per ton in silver and 20 per cent lead. It is much stained with green copper. There are two ledges. One of these is clearly traceable for a long distance. One may go along it for 2000 feet and pick up metal from the croppings every 50 feet. It is from 200 to 300 feet wide. There are two places on the other ledge where it widens to 10 feet of ore body, with mineral for 20 feet in width. Both ledges are undeveloped, merely enough work having been done on them to hold them. One of the surveyed railway routes would take a road within a few miles of this district, thus opening perhaps one of the greatest groups of mines ever discovered.

Tuscarora District.

NEVADA QUEEN.—Times-Review, March 20: North gangway from 600-foot station of North Belle Isle has been advanced 32 feet.

GRAND PRIZE.—500-foot level: Face of north crosscut from the west north lateral drift advanced 22 feet.

BELLE ISLE.—The crosscut from the north gangway, 350-foot level, extended 17 feet, cutting through vein matter giving low assays. Face very wet and rock getting harder.

NAVAJO.—South drift from No. 1 crosscut, 350-foot level, extended nine feet in vein giving low assays. No. 2 crosscut, same level, extended five feet, and work there suspended.

NORTH BELLE ISLE.—North gangway from the shaft, 600-foot level, extended 32 feet, showing considerable fair-grade ore in the face.

DEL MONTE.—1st level: Have started north drift, which has been extended 20 feet, cutting seams of high-grade ore. North drift from joint crosscut extended 12 feet, showing high-grade ore mixed through the face. 2d level: Joint east crosscut advanced 15 feet in very favorable looking formation.

NORTH COMMONWEALTH.—1st level: South drift from joint crosscut has been extended 13 feet, exposing high-grade ore as the drift is advanced. No. 2 north drift, from crosscut south of the shaft, has been run 14 feet. In south drift from No. 1 upraise, work has been suspended, and the ore body will be opened up on the level. Ore in the face of drift

rom upraise is looking well, fully six feet wide of first class, 2d level: Joint east crosscut extended 15 feet, through very favorable looking vein matter giving low assays.

COMMONWEALTH.—1st level: East drift from No. 1 north drift extended 14 feet, following the ore, which is opening up well. No. 2 east crosscut has advanced 13 feet, cutting spar seams, and looking favorable. No. 3 east crosscut has been driven 15 feet through the vein giving low assays. 4th level: East crosscut from north gangway extended 20 feet through porphyry, showing some mineral. Have started to crosscut the vein in north drift from south gangway: it is in 17 feet, cutting some very high-grade ore, and looking better than at any time heretofore. The stops in the different parts of the mine all look well, having yielded for the week 750 cars of ore. That crushed at the mill, battery assay \$247 per ton; concentrator \$16.90 per ton—455 tons. Bullion shipped, \$32,068.57. Owing to scarcity of mining timbers, will have to suspend the extraction of ore, temporarily, in certain parts of the mine until the roads get so teams can haul.

ARIZONA.

BIG BUG DISTRICT.—Prescott *Courier*, March 20: The shaft in the Boggs mine is about 240 feet deep; that in the Hackberry about 115. Water is troublesome. Some 40 men are employed. T. W. Boggs has a force of men washing gravel. They have taken out a great deal of gold.

MASSAYAMPA DISTRICT.—The shaft in the Senator is 275 feet deep. Rapid Transit mine is yielding rich gold ore. Harlan's mill is running. W. W. Vanderbilt has succeeded in organizing the Axtell Co. to work his mines in Maple gulch. He starts in with \$250,000 for development work. Company is made up of Iowa and Minnesota capitalists. Quartz Mountain Co. expects soon to put in new machinery. Supt. Furk is shipping gold rock that pays about \$150 to the ton. Concentrators are very much needed. W. J. Mulvenon says that several mine-owners of Turkey Creek district cannot get at the ore on account of water. The galena ledge from which John Reese brought in some ore is said to be 20 feet wide.

COLORADO.

FIELD FOR PROSPECTING.—Georgetown *Courier*, March 20: If prospectors want an easy field and a profitable field for summer prospecting, they can't find a better place than to take Alpine mountain from opposite the Colorado Central, thence across toward the summit of Griffith and thence on along Columbian and Cooper mountains toward Freeland. A few discoveries along here will be nearer market, more readily accessible and more easily brought to the attention of investors than any amount of discoveries in some far-off and almost inaccessible district. From June to January this section should have the careful attention of good prospectors.

THE CALCIUM SMELTER.—Aspen *Times*, March 20: That a smelter is to be built at Calcium this coming summer is now officially confirmed, and work has already been commenced. There is no other question of such vital importance to Aspen as the one of smelting our silver ores. Had Aspen the smelting advantages of Leadville, she would soon take her proper place as the greatest silver camp in the world. However, the rank of our city is but a question of time, for, as development goes on, the amount of low-grade ore, now unmarketable, is constantly increasing. A smelter at Calcium, though not the best location that might be wished for, is bound to afford some relief, for the freight rate on Aspen ores will be reduced from \$8 a ton to \$2. Smelter and mining men have long realized that nothing could be done in the way of building a smelter on this side of the range without the consent of the railroads. There was but one way to go about it and that was to convince the railroads that the establishment of smelters and reduction works in the valleys of the Grand and Roaring Fork would not diminish, but increase their traffic. That the Midland management has at last realized this is apparent from the favorable concessions they have made to the projectors of this new enterprise. The controlling spirit of the project is J. L. Thomas. C. C. Morgan is the manager of the new works and from him the reporter got his information. He will soon have room at work on the new plant and the smelter will be ready to receive ores by July 1st. Its cost will be \$200,000, and it will have a capacity of 100 tons a day. There is an abundance of good lime rock almost at the very door of the new works. There are thousands of tons of low-grade ore containing much iron in the Frying Pan belt. Only a few miles from Calcium, on Porphyry mountain, the Deane and Argenta groups are showing fine lead ores.

AN IMPORTANT PURCHASE.—The Continental Divide Mining Investment Co. has just closed the purchase of 25 1/2-100ths of the lease and bond on the Bushwhacker and Alpine mines from John T. Prather, Isaac Jones, L. S. Taylor, John Burdell, C. M. Sain, Mrs. J. T. Stewart, James Gould and Ed Grover. This makes that company and the Aspen Consolidated Co. the holders of over 90 per cent. On Saturday, the Continental Co. will make another payment on the bond. Forty men are employed on the property.

DAKOTA.

HYDRAULIC MINING.—Cor. Deadwood *Pioneer*, March 20: We think that the well-informed miner will corroborate the writer's statement that in the Black Hills there are acres of auriferous gravel deposits, on Rapid, Little Rapid, Castle and Battle creeks, in the southern hills. Beaver, Lower Bear and the deeper deposits of Whitewood are practically untouched yet, that will yield not less than 35 cents per yard, and that is a very low estimate with plenty of ground and water and dumping facilities. Hydraulic mining can be made profitable with less than 35 cents per yard; in very few instances has the bedrock been prospected in the water course or creek beds proper; and so far as the writer can ascertain, every instance where bedrock has been prospected, it has given results that are highly favorable. Let the reader bear in mind that on these creeks to which we refer it is 15, 20 or perhaps 30 feet to bedrock; abundance of water on the surface, and on the bedrock the seepage is

so great as to necessitate expensive pumping machinery. Men who are able to put in pumps and machinery, and hire men to do the work of drifting and timbering, generally find it unprofitable. In the hills a number of hydraulic mining companies have been formed and good conveying ditches built, and owing to the fact that the bars furnish the better dumping facilities, hydraulic mining has been almost entirely confined to the bars of the creeks. Some of them have paid handsome returns. There are many places which could be made to pay by means of the hydraulic gravel elevator so commonly in use in California.

IDAHO.

SAWTOOTH.—Ketchum *Keystone*, March 15: We are in receipt of information that the Silver King M. Co. expects to resume work on the Silver King mine as early as practicable in the spring. There is a rumor to the effect that the Silver King M. Co. has entered into a consolidation with other companies controlling mining interests at Sawtooth, but whether there is any foundation for this rumor we are unable to say. If such should be the case, however, the Columbia Co.'s quartz-mill at Sawtooth will, no doubt, be operated during the season.

THE QUEEN OF THE WEST.—Elmore *Bulletin*, March 19: By persistent work under many disadvantages Messrs. Pearson, Adams and Alexon have opened a good mine in their Queen of the West location, a short distance above the great Elmore mining property. They have run the main tunnel along the ledge for a distance of 300 feet and have struck at a depth of 110 feet from the surface, the same chimney or ore body the surface rock from which panned out so handsomely by working process at Reeser's mill last summer. The tunnel for a distance of 200 feet is in good ore, but it does not compare in richness to the big body of free-milling gold quartz they struck a few days ago. The ledge is five feet wide, with well-defined casings and walls, and it is now demonstrated beyond a doubt that it increases in size and richness as depth is attained. A streak of 30 inches of the ledge is very rich in gold and if assorted would pay immensely, but the whole vein from wall to wall could be mined and milled at a big profit.

ELKHORN.—Idaho *World*, March 18: Jess Bradford, foreman of the Elkhorn, and Ed Clark, at work in the mine, came down from there the other day. Jess says the raise, 600 feet from the mouth of the lower tunnel, is now up 256 feet, and is within about 75 feet of the old works of the mine where so much high-grade ore was turned out in the sixties. The raise has gone through some fine ore, but in carrying on this work they have not taken the time to thoroughly prospect the vein. Another raise is going up from a side drift run from the main tunnel 400 feet from the mouth, and they are also prospecting for the chute from which Hugh Turner, in a few weeks, took out \$30,000 from a level above.

AT THE RED CLOUD.—Wood River *Times*, March 20: Ten men have been put to work at the Red Cloud mine during the past few days; and as soon as the tunnel on the 500-level is sufficiently advanced to admit of another tunnel being commenced at a depth of 600 feet, ten more men will be put on. This will make about 30 men at work there, and may be the maximum number which the Co. will employ this year, as this is about as many as can be worked to advantage until more openings are made in the mine. It is the intention of the management to drive a tunnel at every 100 feet of descent, until such depth is attained that it will be cheaper to sink a vertical shaft than work through tunnels. This may not, however, be for years. As there is no particular hurry about it, no large shipments of ore will be made from the property until some time in May. Then, if the ore rates are satisfactory, the production may run up to a carload a day. The property is already opened sufficiently to admit of this; but the management is in no particular hurry about it, as all it wants is a fair return on the investment. Since the company took hold, quite an important development has been made. The face of the tunnel on the 500 level showed 22 inches of ore when the mine changed hands, but since then the ore in the header has widened to three feet. By one shot in the breast, six tons of first-class ore were knocked down.

MONTANA.

ARGENTA DISTRICT.—Cor. Butte *Inter-Mountain*, March 18: In the Argenta district a very confident feeling prevails among those best posted on the resources of the camp that the coming season will place them in a prosperous condition, and that their production and shipments of lead-silver bullion with enough gold in it to make it a matter of interest, will be of sufficient magnitude to attract capital to properly develop and show up their properties. The P. J. Kelly Co. has been merged into the Argenta Mining Co. and the new capital enlisted in this company has already paid off the indebtedness incurred by the old organization.

THE BALD MOUNTAIN DISTRICT.—On the Bull and Dillon lodes McIntosh & Co. have developed some fine gold and copper ores and their prospect is really flattering. A syndicate of Washington, D. C., capitalists have acquired some properties here and are, in a quiet way, developing them with a small force of men, and appear to be well satisfied with their purchase.

THE MAGNET GROUP.—Some Butte capitalists are interested here and work is being prosecuted on their tunnels by a full force all the time, under the management of W. R. Pearson.

THE ELKHORN DISTRICT.—The Critic M. Co. completed their mill last fall, but owing to the altitude and consequent severity of the weather, have not been operating it. The work done before closing on account of the snow was very satisfactory. They can treat nine tons in 24 hours, amalgamating by the barrel process and saving a high per cent of the ore value. They have a large supply of ore out ready to start the mill as soon as the weather will permit. The San Francisco Co. on the Storm and Simpson mines are keeping the water out and L. C. Fyhrle is down making arrangements to continue developments on the property. The principal drawback to the development of this camp is the extreme cold, as it lies over 8000 feet above the sea level.

THE GLEN DISTRICT.—Dr. J. S. Meade and Stanfield have been developing a mine called the Yellow Jacket about five miles across the Big Hole

river from Ulen station. They have two tunnels in on the vein, one 75 feet and the other 45, and have from 8 to 12 inches of a fine chloride ore carrying from 150 to over 500 ounces silver. Both gentlemen are highly elated over their new find.

NEW MEXICO.

GREAT WORK.—Southwest *Sentinel*, March 18: M. W. Neff shipped 40 tons of Little Fanny ore to Denver on Saturday. The Pacific Gold Co. is shipping two carloads of concentrates to Pueblo daily. Mr. Newcomb has resumed the shipment of iron ore to the Socorro smelter. He now employs 45 men at his mill and mine. R. L. Powell is taking out some very rich ore at his property on Walnut creek, and will soon make a shipment. Negotiations for the sale of the Maud S. mine are still pending, and it is understood that the owners have agreed to sell provided the conditions of the sale are complied with on or before the 1st of April next. Mr. Kilgour of Cooney, one of the owners of the Champion mine on Silver creek, was found dead in his cabin a few days ago. His relatives reside in Grass Valley, Cal. The Champion is considered one of the best mines in the Mogollon country.

THE ZINC MINES IN HANOVER.—John Brockman and others have bonded a group of zinc mines in Hanover, belonging to W. Z. Redding, Mrs. John Black, A. Marlin, Peter Mangal, and others. Twenty miners have been employed and a number of teams have been engaged to haul the ore to this place, whence it will be shipped to Mineral Point, Wis., for treatment. M. W. Neff is steadily operating his zinc mines in this district, and says he is making a fair profit on his shipments. He has purchased the interest of his partner, John Irwin, and is now sole owner of the mine.

UTAH.

VENUS.—Eureka *Chief*, March 20: Jas. H. Lawson and Johnnie Hunt discovered a large body of ore on their claim, the Venus, this week, in the mountains beyond Homansville, about 2 1/2 miles east of Eureka. An assay was made of the ore and Mr. Lawson informs us that it goes 15 ozs. silver, 18 per cent lead and 55 in gold. This is pretty rich for surface ore and it will doubtless grow richer as depth is attained. The boys feel sure that they have a good thing. There was quite a rush of prospectors to that vicinity, and the ground adjacent to the Venus was all taken up in short order.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MARCH 18, 1890.

- 423,429.—DEVICE FOR TAPPING SHEET-METAL VESSELS.—C. H. SPINKS, Oakland, Cal.
- 423,778.—LAWN SPRINKLER.—A. A. Kent, San Jose, Cal.
- 423,618.—ADJUSTABLE GROOVING HEAD.—Matthews & Quinlan, Oakland, Cal.
- 423,631.—OIL-CAN HOLDER.—H. Reno, Portland, Ogn.
- 423,447.—METAL RAILWAY TIE.—P. W. Ross, Los Angeles, Cal.
- 423,633.—FENCE POST.—Saxon & James, Colfax, Wash.
- 423,832.—ORE-CRUSHING MILL.—W. C. Stiles, S. F.
- 423,504.—SWINGING GATE.—M. B. Wible, Arcata, Cal.

The following brief list by telegraph, for March 25, will appear more complete on receipt of mail advices:

California.—Samuel Bauman, Santa Cruz, ticket-holder for marking goods; Henry O. Beatty, Sacramento, steam motor for pumps; John R. Brett, Oakland, feed-rod for ore-stamp mills; Walter Bullard, Chico, hallog press; Walter M. Cary, S. F., street-railway car truck; Marcus Dattlebaum, S. F., umbrella attachment; Frank A. Fox, S. F., car coupling; Frank L. Hughes, Arcata, ax head; David D. Jones, Santa Clara, fruit-grader; John Keane, S. F., wind guard; John G. Kitton, assignor of half-interest to W. T. Garratt, S. F., machine; Albert McDowell, assignor of half-interest to J. A. Stroud, Selma, Napa, Nisson, Sacramento, fender for feed-cooler; Charles H. Olm, S. F., railway switch; Neil K. Pearson, S. F., brake shoe; Albert H. Richardson, S. F., machine for sharpening cutting tools; Frederick A. Robbins, S. F., machine for crimping the heads of metal cans.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Bullion Shipments.

We quote shipments since our last and shall be pleased to receive further reports:

Cons. California and Virginia, March 26, \$64,515; total to date for March, \$78,813; Hanauer, 19, \$2650; Ontario, 19, \$21,821; Hanauer, 20, \$6150; Justice, 22, \$4574; Commonwealth, 24, \$16,000.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging efforts. We intend to send none but worthy men.

J. C. HOAG—San Francisco.
R. Q. RAILY—San Francisco.
E. B. BUCKMAN—Santa Cruz Co.
SAMUEL CLIFF—San Luis Obispo Co.
C. J. WADE—San Bernardino Co.
W. W. THORNTON—Los Angeles Co.
E. H. SCHARFF—Calaveras Co.
FRANK S. CHAPIN—Colusa Co.
ISAAC AYER—Fresno, Cal.
HERBERT CARPENTER—Fresno Co., Cal.

Mining Share Market.

The past week showed continued activity in Chollar and Potosi shares, with the latter in the lead. The movement has been sharp and decisive. So far as we can learn, the general public have no faith in the proposition, neither do experienced miners speak any too hopeful, yet they qualify their remarks by saying that it is a gamble, for present prospects may prove by work more valuable than now thought. To an outsider it looks as if the manipulators have shorts on the stock who they are determined to make fill, after which peddle out the shares. This has always been the case heretofore. The Potosi mine at to-day's (Thursday) quotations is selling at about \$500,000, which is a very good price. Yet the shares may sell higher before there is a decided break. In the other stocks there has been only a slight upward movement in sympathy with the advance in Potosi. In the Tuscaroras and other outside mining shares, trading has been light, attention being drawn to the middle group of the Comstock mines.

In another department of to-day's paper there appears a communication from an experienced practical miner on the present situation on the Comstock lode.

Several mining men are to leave to-morrow or Saturday for Virginia City to examine the Potosi and Chollar mines. In our next week's issue, we will be able to give the result of their investigation.

From the Comstock mines, while reliable private advices continue scarce, yet a few items begin to leak out, which give a fair idea on what the present movements in stocks are grounded.

The upraise in Potosi is up from the 930-foot level, 65 feet, and is in 3 feet of ore assaying from \$35 to \$45 a ton. On the same level a winze is being sunk on the same ore, which at last advices had widened to 4 feet, assaying from \$30 to \$50 a ton. A drift from the Ward Shaft is being pushed west to get beneath the ore found in Potosi. In Chollar they are preparing to start several crosscuts next week in the ledge now being opened up in Potosi. Advices from Hale and Norcross report that work was suspended owing to a flow of water, but this is about over now, and work is to be resumed. At the date of stopping work a 6-foot vein of \$40 to \$65 ore was cut on the 1200-foot level, which widened to 9 feet on the 1250-foot level. On the 1300-foot level a drift is being run to tap the downward continuation of the ore. If it widens at the same rate as it did from the 1200 to the 1250-foot level, it ought to be quite a good sized body of ore on the last named level. In Overman, on the 1200-foot level a body of good ore is being developed.

From the Tuscaroras, private information that is reliable is hard to get. Mr. Hyman, who has just returned from the district, speaks in glowing terms of the situation, yet the shares of the mines listed on the stock boards act as if they were very "sick." From the Quijotas our advices are favorable, as are they from the Mt. Diablo mine. From the Bodie district our advices are still more favorable. Stringers and streaks continue to come in in Bodie, and the more favorable are followed with the hope of finding something of value. Those in position to know are very hopeful over the present situation. Work is being done in all the levels from the 800 up to the 400 foot level.

Potosi was assessed to-day 50 cents per share.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

D'OPALE COSMETIQUE COMPAGNIE, March 21. Object, to manufacture opaline and other toilet articles. Capital stock, \$5000. Directors—A. W. Hinton, L. M. Kand, W. Blaisdell, C. J. Blaisdell and S. V. Harris.

HOME INVESTMENT ASSOCIATION, March 21. Object, to deal in real estate and loan money. Capital stock, \$1,000,000. Directors—Jeremiah F. Sullivan, Jas. H. Barry, Frank T. Shay, John C. Bateman, Wm. H. Gagan, Charles T. Stanley, John Galloway, Edward J. Casey and William F. Welch.

STAR BOWKETT LAND AND BUILDING ASSOCIATION. The Directors are John M. Days, Edward Oliver, Wm. F. Floyd, Wm. Clark, F. D. Branden, H. V. Hutton, W. H. Fuller, Peter F. Hollings and Hy G. Jackson.

MENDOCINO COUNTY REOWOOO ASSOCIATION. Capital stock, \$500,000. Directors—Franklin Heywood, Samuel Blair, J. G. Jackson, E. J. Dodge of Alameda, C. E. White, E. C. Williams and L. E. White of Oakland, and Henry Wetherbee and Robt G. Bixbee of Fruitvale.

SUMNER FANNING CO. Capital stock, \$200,000. Directors—Frank W. Sumner, Chas. Stewart, Jas. Stevenson, M. P. Brown and Wm. Baillie.

ROBERTS PRINTING CO. March 22. Capital stock, \$25,000. Directors—John W. Roberts, E. K. Roberts, W. L. Seward, Wm. H. Hyde Jr., H. L. Kear.

CINCINNATI M. Co., March 25. Location, Tombstone, A. T. Capital stock, \$10,000,000. Directors—A. F. McGrew, W. B. Reynolds, F. Tagliabue, N. B. Lazard and W. Gambis.

BELVIDERE IMPROVEMENT CO., March 26. Object, to deal in lands, railroads, vessels, water rights, buildings, franchises, etc. Capital stock, \$500,000. Directors—Fred S. Wilson, H. N. McChesney, A. G. Pratt, Henry Thompson and Frank P. Pray.

JOOOE HOGE has signed the findings in the case of Archie Borland against the Nevada Bank. The judgment is for \$71,469.54 in favor of Mr. Borland's estate. The indebtedness grew out of mining and water-right speculation in the Black Hills country several years ago.

THE franchise to the Pacific Telephone and Telegraph Co. to lay underground conduits to the city has been granted by the Supervisors, notwithstanding the Mayor's veto.

SMARTSVILLE, Yuba county, is having an old-time boom; about 150 men are employed in the mines there.

MECHANICAL PROGRESS.

Notes on the Working of Steel.

1. Good soft heat is safe to use if steel be immediately and thoroughly worked. It is a fact that good steel will endure more pounding than any iron.

2. If steel be left long in the fire it will lose its steely nature and grain and partake of the nature of cast iron.

Steel should never be kept hot any longer than is necessary for the work to be done.

3. Steel is entirely mercenary under the action of heat, and a careful study of the tables will show that there must of necessity be an injurious internal strain created whenever two or more parts of the same piece are subjected to different temperatures.

4. It follows that when steel has been subjected to heat not absolutely uniform over the whole mass, careful annealing should be resorted to.

5. As the change of volume due to a degree of heat increases directly and rapidly with the quantity of carbon present, therefore high steel is more liable to dangerous internal strain than low steel, and great care should be exercised in the use of high steel.

6. Hot steel should always be put in a perfectly dry place of even temperature while cooling. A wet place in the floor might be efficient to cause serious injury.

7. Never let any one fool you with the statement that his steel possesses a peculiar property which enables it to be "restored" after being "burned;" no more should you waste any money on nostrums for restoring burned steel.

We have shown how to restore "overheated" steel.

For "burned" steel, which is oxidized steel, there is only one way of restoration, and that is through the knobbling fire or the blast furnace.

"Overheating" and "restoring" should only be allowable for purposes of experiment. The process is one of disintegration and is always injurious.

8. Be careful not to overdo the annealing process; if carried too far it does great harm, and it is one of the commonest modes of destruction which the steel-maker meets in his daily troubles.

It is hard to induce the average worker in steel to believe that very little annealing is necessary, and that a very little is really more efficacious than a great deal.—*Exchange.*

Steel Ties Successfully Tested.

Some of the "Standard" steel ties have been in service on a quarter of a mile of the Chicago & Western Indiana railroad about four months. The ties are of channel section, with a block of compressed, preserved wood (on end grain) under each rail. Concerning the results thus far reached, Mr. J. W. Clark, roadmaster of the Chicago & Western Indiana railroad and the B. & O. railway of Chicago, says: "These ties were laid October 1, 1889. They were put in at the above location on south-bound track, for the reason that at this point the ballast is very light gravel, which would make the test much more severe than if they had been put in at another location of the road. The traffic on this section is 80 regular trains in one direction every 24 hours. The heaviest engine weighs 98,000 pounds, with 15,000 pounds on each pair of drivers. So far the ties have given perfect satisfaction, requiring but slight attention, and that only when first laid. There are no loose bolts, clips or nuts. It would be impossible for me to estimate correctly, at the present time, the saving in maintenance, as the only thing to need attention is the bolts and clips, and so far they have shown no indication of weakness in any particular. There has been no upheaval of the ties where the ground is frozen, and from present indications I hardly believe that such will occur. The ties are in good line and surface, and hold the rails in an upright, rigid position, so that the wear on the rail-head seems to be more uniform and even than where wooden ties are used. I am free to say that the ties have so far surpassed all my expectations. There seems to be no possibility of spreading of the rails. Should a rail break, there would be less liability to accident, for the reason that the fastenings hold the rail absolutely firm and rigid. I believe that the saving in maintenance that will eventually be shown, and the absolutely safe, permanent way which these ties make, to say nothing of their greater life, will show greatly in their favor."

To BUILD STEEL CARS.—The fact that this is the age of steel, says an exchange, is emphasized by the announcement of the birth of another town, the purchase of half a million dollars worth of acre property, and the perfection of a practical idea that will revolutionize railroad travel. The project is the manufacture of steel railway cars, which, although not a new thing by any means, has not yet been largely entered upon. The site of the new town is within the corporate limits of Chicago, embraces 700 acres, and in point of manufacturing importance promises to become a second Pullman. Plans are already drawn up for works covering ten acres, near the intersection of Grand Trunk and Illinois Central railroads. The main purpose of the company is the construction of an absolutely fire-proof steel car,

These cars will not have any wood in their composition, and will be wholly of steel or other non-combustible material. The steel used, known as Kalamein, is impervious to rust, susceptible to the highest polish, and not liable to contraction or expansion under varying degrees of temperature. The new car has received the indorsement of experts in car-building, the model now in use being a first-class postoffice car, built on plans approved by the Postoffice Department, and fitted up with all the latest improvements. We presume that the works above described are for putting into practical use the invention of a well-known resident of San Francisco.

MANUFACTURE OF RED GLASS.—The secret of the manufacture of red glass for church windows—12th and 13th centuries—was, according to a paper by C. E. Guignet and L. Magne, only recovered by Bouteims in 1826, who showed that the red color was due to the presence of cuprous oxide. The modern manufacture, however, is not equal to that of early times. The author—*Journal of the Society of Chemical Industry*—shows that the glass of the 12th and 13th centuries may be divided into three main classes: (1) Glass veined on the surface. These markings are only on the one surface, and have been produced during the blowing by the spreading out and flattening of the glass, due to centrifugal force, at the end of the blowpipe. (2) Glass colored in the middle. This was obtained by fusing a very thin layer of red glass between two colorless surfaces. The effect is much finer than that obtained by the present method of flashing, i. e., having the colored glass outside and the colorless within. (3) Glass marbled in its substance. This was of two kinds. In one case the markings were bent, twisted and turned back on themselves in no sort of order, while in the other the colors occurred in exceedingly thin layers always parallel to one another, and the whole way in outline. The color is made up of different shades of red, and the veining is only red on the surface. They have been produced by glass of a yellowish tint arising from the presence of protoxide of iron coming in contact with the greenish-blue glass, due to cuprio oxide.

STEEL TRUSSES FOR MASTS.—There is no problem of greater interest to shipbuilders and owners along the Atlantic Coast just now than that of devising a safe and otherwise satisfactory rig for the big four-masted schooners that have become so fashionable within the past three or four years. Instead of the long, thick, heavy spar rising from the midship line, it is proposed to substitute two neat, substantial steel trusses. The trusses are to be built of three or four pieces of flat steel set edgewise to the side of the ship, and united by angle irons riveted between them and by tie rods, which would make the truss at once light, stiff and symmetrical. Where the trusses meet at the cross-trees, they would be riveted to a stiff steel cylinder, in which the topmast would be stepped. From the heel of this topmast, or from the steel cylinder in which it was stepped, would be stretched a steel rope, the lower end of which would be set up in a stout eye-bolt set into a deck beam. The sail could be secured to this perpendicular stay by clips, just as the yacht jibs are secured to a j-bstay. The boom and gaff would swing on metal collars put around the rope. The sail would swing to and fro as readily as it now does. The steel rope on which it swung, if of proper size, would stand a much greater strain than any wooden mast. Further, to strengthen the trusses that at once replace masts and shrouds, cross-plates and tie-rods could be run from truss to truss, but if the truss-plates were made of suitable size, and the size could be easily calculated, these long tie-rods would not be necessary.

SOMETHING NEW IN STEAM-ENGINE FOUNDATIONS.—Among the remarkable examples of bold engineering in the great sugar refinery of Claus Spreckels, of Philadelphia, Pa., one of the most unique is the hanging or aerial steam-engine foundations. The engines used in this establishment are distributed practically all over the buildings, a large proportion of them being on upper floors. Some of these engines are bolted to iron beams or girders on second and third stories of the building, and are consequently innocent of all foundation. Some of these engines run noiselessly and satisfactorily, while others produced more or less vibration and rattle. To correct the latter, the engineers simply suspended foundations from the bottoms of the engines, so that, in looking at them from the lower floors, they were literally hanging in the air. A foundation does service to an engine, or any machinery, it seems, by its weight alone; hence it makes little difference whether the foundation be firmly imbedded in mother earth or in the air.

CEMENTING AS A SUBSTITUTE FOR WELDING.—By a new method of cementing iron, the parts cemented are so effectually joined as to resist the blow even of a sledge-hammer. The cement is composed of equal parts of sulphur and white lead, with a proportion of about one-sixth of borax. When the composition is to be applied, it is wet with strong sulphuric acid, and a thin layer of it is placed between the two pieces of iron, which are at once pressed together. In five days it will be perfectly dry, all traces of the cement having vanished, and the work having every appearance of welding.

SCIENTIFIC PROGRESS.

THE TONGUE OF A SNAIL.—The month of the snail is armed with a very formidable instrument in the shape of a remarkable saw-like tongue which slices off leaves like a knife. Probably you have, at some time or another, noticed how cleanly cut are the edges of a leaf upon which a snail has been regaling himself. It is difficult to imagine how such a soft and flabby-looking animal can have made such clean incisions. But with an examination of the cutting instrument concealed in his month, wonder on this score vanishes. It resembles a long, narrow ribbon, coiled in snob a manner that only a small portion of it is called into use at once. Thickly distributed over the entire surface of this ribbon are an immense number of excessively sharp little teeth, designed in a manner which admirably adapts them to the purpose for which they are intended. The number of these teeth is incredible—one species, for instance, has been indisputably proved to possess as many as 30,000 of them. The reason for their disposition on a coiled, ribbon-like surface lies in the fact that by use they become worn away. As this happens, the ribbon is uncoiled, and the teeth, which before were wrapped up in it at the back of the snail's mouth, come forward to take the place of those which have served their turn. The upper part of the mouth consists of a horny surface against which the sharp-toothed tongue works. A leaf which is to be operated upon is caught between the two and subjected to a regular file-like rasping on the part of the tongue. So effective an instrument does this form that the tough leaves of the lily may often be found to be entirely rasped off by it.—*Longman's Magazine.*

STANDARD OF LENGTH.—In the United States and England, the standard of length is the yard; and the question arises, How long is a yard? It may be said in answer that a yard is simply an arbitrary standard which tradition says is based upon the length of the arm of Henry VIII. At present the yard is the distance between the two marks upon a certain bar, kept in the Tower of London, and if it should be destroyed, the exact standard could never be replaced. To avoid this uncertainty, and obtain a fixed and unvarying standard, the French, in the last century, made an accurate measurement of a quadrant of the earth's circumference, and taking the ten-millionth part of this distance, gave it the name of meter, and adopted it as the standard of length. The length, which is equal to about 39.37 inches, is now in universal use on the continent of Europe, and is authorized as a legal standard in nearly all countries. Considerable discussion has arisen as to whether the original measurement was perfectly accurate, and it seems probable that there was a small error, so that if the standard meter now kept in Paris should be destroyed, a remeasurement of the quadrant of the earth would not give us exactly the same meter. However, the error in any case is a very minute one, and the chances are very small that the original standard will ever be destroyed, to say nothing of the fact that the numerous copies distributed among the various nations of the world do not appreciably differ from it.—*Popular Science News.*

AN OXYGEN EXPLOSION.—An accident which occurred in Lexington, Ill., gives sad emphasis to the necessity for care in conducting chemical experiments. Professor J. Jess, of the high school, started to make oxygen for his chemical class. He used as a retort a piece of gas pipe eight inches long and two inches in diameter. On applying heat for a short time an explosion occurred and the retort blew up like a bomb-shell. The room was wrecked, Professor Jess and several others were terribly injured, while about twenty were included in the list of wounded. The probabilities are that the chemicals were impure. About twenty years ago a similar accident happened at the School of Mines, Columbia College. The experimenter had by mistake mixed sulphide of antimony, instead of binoxide of manganese, with chlorate of potash. On applying heat the mixture in the retort exploded and the experimenter's sight was permanently destroyed. Oxygen can with perfect safety be generated in a glass retort, flask, or test tube, but the mixture of chemicals should always be tested by heating a small quantity in the bottom of a test tube. If it evolves oxygen quietly, the oxygen mixture may be considered correctly made. Sulphide of antimony and binoxide of manganese are so similar in appearance that the mistake described above is one always liable to happen, and the result is practically gunpowder or worse. Organic matter or sulphur may bring about a similar result.

SOLVENT POWER OF A LIQUID.—A very simple experiment may be performed to show the solvent power of a liquid, namely, by taking a small vial of camphor water or a quantity of alcohol with as much camphor dissolved as it will hold, and then adding to this a drop of water; it is as clear as water itself until the drop is added, when the solution is weakened so much that it cannot hold the camphor longer in solution and begins to give it up in a white cloud, allowing it to rain down to the bottom of a glass. About the same process as this is effective when a specimen of drinking water is to be examined for a test of organic matter which it

may contain in solution. The solvent power for this impurity is reduced by giving the liquid something better to dissolve, or something to dissolve for which it has a greater liking, sugar being one of the best known substances in this respect; thus when a spoonful is added to a flask and corked up tight in the sunlight, the water drops the organic matter and adopts the ingredient it has a greater affinity for—all that is required being to watch for the minute black specks which will be seen floating in every portion of the liquid when water for drinking purposes is to be tested for purity.—*Ec.*

GUNS FOR FOG SIGNALING.—Guns have for some years been used with satisfactory results for fog-signaling on the Swedish coast. Their signals have been heard as far as 12 nautical miles. A new gun has just been manufactured and stationed at Hohné Gadd in Sweden, made of best wrought Sandviken Bessemer steel by the Stafsjo Engineering Company. It is ten feet long and the caliber is 60 millimeters. The breech-loading mechanism allows of firing from 20 to 30 shots per minute. It will thus be possible to fire letters according to the Morse alphabet, one shot being a dot, and two shots close together a dash. Of this system of signaling more may be heard by and by. The breech-loading mechanism can be taken out and to pieces in less than a minute, and without the use of any tools, and also put together without any. The cartridges can be used from 100 to 300 times. The gun rests on a gun carriage of wood, and is placed in a small wooden shed, the barrel projecting through a hole in the wall. The shed or house is very conveniently arranged for the men, with accommodation for refilling the cartridges, etc. The gun, with 130 brass cartridges, spare parts and ammunition for 10,000 shots, has only cost \$1375. The gun can probably stand some 40,000 shots; so the cost for a shot, exclusive of power, will be only about two cents.

DISCOVERY OF PLATINUM AND NICKEL.—A discovery that may be truly described as wonderful in its probable results, says the Canadian correspondent of a contemporary, has been made at Sudbury, Ontario. Copper mines have been worked there for a good while and platinum is found in the same mines, but the metal nickel is also found there in an enormous quantity, so great that it is said one month's output would supply a year's demand from all parts of the world. But this is not all; in preparation of the alloys it is found that certain proportions of nickel and steel produce a compound with characteristics that will in all probability revolutionize the steel interest. Nickel is not an expensive metal, and this compound of nickel and steel can be produced at a far less cost than best Bessemer steel, while it is not only suitable for every use to which that metal is applied, but is very superior to it.

THE IMPORTANCE OF MINUTES.—Boston people seem to have a somewhat exaggerated value of the importance of minutes in traveling. They want shorter time for the run between that city and New York, and the subject has been brought before a legislative committee. It was claimed by one of the representatives that the railways could if they were disposed shorten the present time of six hours between the two cities by from 27 to 35 minutes, which, while it may be true, would hardly seem to justify legislative action. The power of legislatures to fix the rates which railway companies may charge for their service is established, but their right to compel the running of trains at a faster speed than the managers consider prudent or advisable may still be open to question.

IMPORTANT DISCOVERY.—An important discovery has been made by Col. Richmond Hibbard of Camden, it being a manganese mineral pigment. He has been making practical tests for several months. Inexhaustible quantities of the mineral are found in various parts of the country. In this locality it runs in seams of six feet in thickness. The cap and base of the seam of manganese block is an isoprey, which, mixed with the manganese, makes the finest of fire-proofing.

THE FAST FISHES, according to Prof. G. B. Goode, are of pointed build with close-lying fins, and are frequently predaceous. Food fishes, on the other hand, are often slow, and easily caught, but are correspondingly prolific. The actual speed of fishes is not as yet well known; but as dolphins have been observed to swim round and round a steamer going at full speed, their speed is estimated at 20 miles an hour or more.

LACK OF SYMMETRY IN THE EYES.—When the average man or woman comes to be fitted with the first pair of glasses, some curious discoveries are made. Seven out of ten have stronger sight in one eye than the other. In two cases out of five one eye is out of line. Nearly one-half the people are color-blind to some extent, and only one pair of eyes out of every 15 are all right in all respects.

A PETRIED TREE was found recently in a coal mine at Osnabruck, Germany. The trunk is almost four feet through, and the roots cover a surface about 15 feet square. The tree has been set up in a special room in the Berlin School of Mines.

GOOD HEALTH.

MORTALITY AMONG RAILWAY EMPLOYEES.—During the past year, by the report of the New York Railroad Commission, 119 employees were killed and 712 were injured. The commission advises that a law be made requiring railings around the roofs of freight cars over which brakemen are often obliged to walk. In icy weather many slip off, and frequent fatal accidents thus occur which a little forethought would have prevented. Another recommendation is that no new railroad be built without the consent of the commission. This is to prevent the duplicating of railroads that would unnecessarily compete with each other. But who shall decide when such competition is unnecessary? At present this decision is left with the State Legislature, which must charter the new road before it can begin to do business. If railroads were not run to make extortionate profits, there would be less likelihood of competing lines. A law of New York authorizes the State to take possession of railroads that earn more than ten per cent on their capital stock. To avoid this, most of the roads are capitalized for much more than their cost. If they pay large profits on this watered stock, there is constant temptation to capital to invest in new roads built more cheaply and capitalized for much smaller amounts. When men in other business act thus foolishly, they are left to suffer, and the public reaps the benefit of their competition. The State should retain sufficient control over these corporations to prevent their consolidation, when their continued competition would prove beneficial to public interest.

EXERCISE FOR CHEST DEVELOPMENT.—Exercises of strength, writes Dr. Fernand Lagrange in the *Popular Science Monthly* for February, lead rapidly to an increase in the size of the thorax. It is the same with exercises of speed when they need very energetic movements. No exercise develops the chest as rapidly as does running, unless it be wrestling. Mountaineers all have large chests, and the Indians who live on the high plateaus of the Cordillera in the Andes have been noted for the extraordinary size of their chests. This great development in mountaineers is due to two causes which act in the same direction—frequent ascent of steep inclines and constant residence at great heights at which the air is rarefied. The climbing of these slopes needs a great quantity of work, which causes increase of the respiratory speed; respiration in a rarefied atmosphere obliges a man to take deeper breaths in order to supplement, by the quantity of air breathed, the insufficiency of its vivifying properties. Singers, with no other exercise but singing, acquire great respiratory power and a remarkable increase in the dimensions of their chests. Numerous observations prove that it is enough voluntarily to take a certain number of deep breaths every day to produce, in a short time, an increase in the circumference of the chest which may amount to two or three centimeters.

THERE IS NO HARMLESS HYPNOTIC.—Dr. Hutchinson says: "I have recently met with several cases of insomnia due to overtaxation of the American nervous system, and have been requested to prescribe some drug that would be effective to procure sleep and be at the same time harmless. No such drug exists. There is no medicine capable of quieting to sleep voluntary life that has been working ten hours at high pressure, except it be more or less poisonous. Consumption of chloral, bromide in some form, or opium, has increased in this country to an incredible extent, is still growing, and a large number of Americans go to bed every night more or less under the influence of poison. Sleep thus obtained is not restful or restorative, and nature eternally exacts her penalties for violated law more severely in these cases than in most others. Digestion suffers first; one is rarely hungry for breakfast, and loss of morning appetite is a certain sign of ill-health. Increasing nervousness follows until days become burdensome, and poisoned nights the only comfortable parts of life."—*American Magazine*.

CHILLS AND FEVER.—"Uncle Dan Perkins" has given the *Monroe Tidings* the following recipe, which he avers has cured hundreds of cases of chills and fever in Tulare county and elsewhere, without failing in a single instance. Here is the prescription: Put the yolk of one fresh-laid egg into four to five (according to age of patient) spoonfuls of older or wine vinegar; beat well together and take a dose like this three times a day for three consecutive days, half an hour before each mealtime, and do not stop short of the nine doses, even if the chills have ceased.

INFLUENCE OF LIGHT ON THE HUMAN SYSTEM.—Italian physiologists have shown that change of tissue in animal organism is promoted by light. It is further found that the change is so slow in darkness that the ordinary reserve of nutriment stored in the body is sufficient to preserve from starvation for a very long time.

CHOLERA IN ASIA.—A correspondent of the *Bulletin Medical*, writing from Teheran, says that cholera in a virulent form exists throughout the valley of the Euphrates, and it is feared that it will become epidemic in Persia.

USEFUL INFORMATION.

CONTINENTAL DESERTS.—The most recent explorations appear to show that the popular idea that the great African continental desert of Sahara and our own great American desert are not as desolate as they have been represented to be. According to the *American Field*, cargoes of bones are being collected on the desert of Sahara and shipped to New York, just as buffalo bones have been gathered on our Western prairies for many years. They are ground up and used as fertilizers. The interesting query at once presents itself as to what particular time, more or less remote, those localities on the great African desert where these bones were found were covered with verdure sufficiently luxuriant to produce the food which gave sustenance to the animals whose bones are now being gathered. In Africa the caravans have followed the same old trail for centuries, and until the military campaigns of the last few years disclosed fertile spots and oases which were previously unknown, the whole vast region was supposed to be an arid waste of shifting sand. Explorations may yet discover that as large a portion of the African desert is arable as of the civilized American desert. Assuredly it must at one time have been well clothed with verdure to have harbored the immense number of animals represented by these numerous collections of bones.

ORNAMENTAL HOSE.—It was a coil of rubber hose to hang in the hall of an infirmary, to be used in case of fire. One day they took it down in order to sprinkle the lawn, but as soon as the water was turned on it burst in half a dozen places. The infirmary directors were raging. They took the hose back to the rubber store and demanded an explanation. The proprietor of the store said that he had sold it in good faith, supposing it to be a good article. In order to satisfy himself, he wrote to the manufacturer, who replied that the hose was simply an ornamental article, made to hang up in factories "to satisfy insurance requirements." So there is a hose made that is to be looked at, not used! Here is a big factory, and its owner, supposing that in case of fire he can turn on twenty lines of hose at once, is putting his trust in a rotten, good-for-nothing pipe. Better inspect all these emergency hose lines at once.—*Cincinnati Times Star*.

SOOT OUTSIDE OF CHIMNEYS.—Soot is very often seen to gather on the outside of chimneys. A correspondent of the *Boston Journal of Commerce* says he has a chimney 150 feet high covered with soot from bottom to top, and asks the cause. That journal answers as follows: "One of the products of combustion is water formed by the union of hydrogen and oxygen in the fuel when present in the proper proportion. This water escapes in the form of vapor and some of it is condensed on the inside of the chimney. The brick being porous absorb the water, which works its way through to the outside, carrying soot with it by capillary attraction, and, in time, enough appears to be observable on the outside. Where wood is used for fuel this should show more plainly, owing to the considerable amount of water appearing about the furnace and connections when wood is burned."

"SMOKELESS POWDER" was the subject of a recent lecture by Sir Frederick Abel at the British Royal Institution. After dealing with the history of the manufacture of gunpowder and the difficulties attending the production of the higher explosives—gun-cotton, dynamite, melinite and blasting gelatine—Sir Frederick observed that the smokeless powder of Europe which was now being manufactured was a gelatinous substance shaped into threads and strips under pressure. It was made by dissolving gun-cotton or some similar material with camphor or other solvent, and forcing the compound, when properly prepared, through perforated dies. The lecture, illustrated with experiments, was heard with deep attention by a large and fashionable audience.

NEW ROSES INTRODUCED THE PAST YEAR.—Of the 108 new roses produced during the year just passed, 73 are credited by a Vienna journal to France and but five to the United States. Of this latter number San Francisco is down for one, to which very high praise is given—the "Rainbow," which has attracted much attention at the meetings of our Floral Society. It was produced by Mr. J. H. Sievers of San Francisco and is a sport from Papa Gontier. Two new varieties—the Rosalie and the Marshall P. Wilder—are credited to Messrs. Ellwanger & Barry; the Dinmore to Peter Henderson, and the White Pearl simply to America.

STOPPING FIRE ON WATER.—An arrangement to prevent the spreading of oil burning on the surface of the water in harbors is described in a French paper, and is in use in several French harbors. It consists of a floating dam built up of galvanized sheet-iron boxes with flexible connections. By means of this a section of a harbor may be cut off from the rest, and burning material confined where it will do least damage.

AMMONINE is the name of a new prepared chemical, intended as a substitute for caustic soda in the purifying of rags, old papers, etc. It is of German origin. The makers of this

new chemical compound claim for it advantages as a "cleaner," entirely saving the use of caustic in preparing certain "white" stock, besides in no way injuring the strength of the fiber.

PRESERVING ORANGES.—It is said that oranges are now preserved in silos made in the sand, being first wrapped in tissue paper.

ELECTRICITY.

THE STORAGE BATTERY FOR ELECTRIC LIGHTS. The use of the storage battery for lighting purposes is attracting increased attention, especially among the manufacturing corporations to whom the efficient lighting of mill plants in winter-time is of the first importance. The storage battery as a practical means of supplying both electric light and power is now fully recognized and thoroughly appreciated by those who have given it a practical application. Evidence has demonstrated that electric lighting can be done with as much ease, safety and economy from a storage battery as gas lighting can be done by a gas company. This has been done without antagonizing either the interests of the gas or electric-light companies. The introduction of the electric light has increased the consumption of gas, having brought its price low enough to be used as a fuel. On the dynamo of the electric-light companies the storage batteries must depend in a great measure for their source of supply, and this fact must necessarily benefit the electric companies. The Sorley Storage Battery Co. of Lowell, Mass., claims that the problem of the economical commercial use of storage batteries has been solved and that batteries will soon be made that will be capable of supplying a mill with 2000 incandescent lights. Several mills have water privilege which can be used 15 hours a day but now are used but 10 hours, and it is suggested that the power which is now unused could be advantageously used to light the mills during the night. Several owners of large blocks in Lowell are also considering the feasibility of using their elevator engines during the day to run a dynamo and indirectly charge storage batteries to light their mills. The electric current used from the batteries will be measured by meters.

SAFETY OF ELECTRIC LIGHT.—The experiments made by the Paris Society of Electricians as to the danger of fire from electric lighting, appear to have been very thorough. An experiment was made with a bare wire, placed on a small board, and in part with a second board—a wire which should normally contact a current of about four amperes—and the current was carried up to 40 amperes without the wood commencing to carbonize. For a current much more intense the wood took fire at the part where the wire is uncovered before burning the other part, where the want of air made inflammation slower. It is known that these accidents are avoided in a very efficacious manner in practice by the use of fusible plugs. In order to determine to what extent the lamps themselves were capable of setting fire to strips and combustible bodies placed in their vicinity, the globe of an ordinary arc lamp of the Cane system was enveloped in several thicknesses of green tulle; a 32 candle incandescent lamp was enveloped in the same way, the folds of the material being joined under the lamp by an india-rubber band; a lamp of 33 candles was covered with a cotton cap of double thickness; another was covered with a sort of black silk, which was in its turn covered with another of black velvet; two lamps were covered with two layers of gummed wadding, white in one case and black in the other; a lamp of 32 candles was placed in vertical fold formed by an old theatrical decoration; and, lastly, a lamp of 300 candles was applied against an old decoration. It was found that neither carbonization nor exaggerated heating took place in 20 minutes in the first, second, fifth or seventh experiment.

WHAT ELECTRICITY WILL DO IN THE NEAR FUTURE.—Prof. R. H. Threlton, in a recent article, gives a graphic description of what electricity will do in the near future. He says it will break up the present factory system and enable the home worker once more to compete on living terms with great aggregations of capital in unscrupulous hands. Great steam engines will undoubtedly become generally the source of power in large cities and will send out the electric wire in every corner of the town, helping the sewing woman at her machine, the weaver at his pattern loom, the mechanic at his engine lathe, giving every house the mechanical aids needed in the kitchen, the laundry, the elevator, and at the same time giving light, and possibly heat, in liberal quantity and intensity.

ANOTHER ELECTRIC DANGER PREVENTIVE.—Inventors are rapidly coming to the front with devices to avoid danger from electric currents. We clip the following from an Eastern exchange: Anything which tends to decrease the danger at present attending electric wires is of interest in all cities and villages where electric light or other high tension currents are used, and experts are hard at work to invent something practical to overcome this danger. One of these inventions now being tested in New York appears to fill the bill pretty well. It is a small contrivance and resembles an ordinary telegraph instrument. It consists of

a coil of wire, through which is run a metal rod, on the upper end of which is a rubber button. The lower end of the rod comes in contact with the brass bar swaging in the center like a see-saw. At the opposite end of the little bar is a lever like a switch, which connects with the dynamo and cuts off and turns on the current. The little swinging bar rests with a catch on top of this lever. The instant the charged wire is severed at any point along the circuit, the safety device is so constructed that the swinging bar drops from the metal rod in the coil, thus releasing the switch lever at its other extremity, and the lever thus released automatically cuts off the current from the dynamo. Ernest P. Clark, the inventor of this appliance, cut a wire running overhead which supplied a circuit of 30 lights in his laboratory. The little automatic safety device clicked, the lights were immediately extinguished and the electrician picked up the severed ends of the wire and handled them with impunity.

THE BUILDER.

Flooring.

In order to have a first-class house, it is necessary that the floors should receive a great deal more attention than is usually given to that part of the work, especially when the floor is to be laid in a store, office, hall, or other similar uncovered condition.

In the first place, the material should be of the best. Select those boards having a straight, or "comb" grain, as it will wear longer and better than those which are "quartered" grain, and which in time "split" and break out in layers, causing great holes in the floor, and not infrequently holes in the shoes and feet of those walking on them. As all woods shrink more or less, it is best to have the flooring narrow, as the shrinkage is more evenly distributed than where wide stuff is used; besides, it looks better. Of the hard woods, oak, ash, maple and walnut are used a great deal; but it is safe to say that 80 per cent of the floors laid are yellow pine, which, if properly done, will give better satisfaction than if some of the higher-priced woods are used.

Before "laying" the floor, it is necessary to have the floor beams even on the top edge, and as it is almost impossible to find a lot of beams of the same width, they should be taken to a "size" on the ends and over girders, after which they should be "bridged" at least two rows for every 25 feet of width, the beams being placed from 12 to 16 inches to centers.

Having got everything in readiness for laying, see that the first "streak" is straightened thoroughly its entire length, then commence and lay each board, milling it through the tongue edge to each beam, not skipping three or four beams, as many do, or, as is often done, laying several streaks at once and packing them up, nailing the outside one only. Moreover, see that the "butts" are cut square and not "under," as is the common practice, which, when it is worn down, causes the butts to gap.

Bruising the edges or tongues should be avoided, which is best accomplished by using a piece of the same flooring to ram against, or, what is better, using one of the many good patent flooring jacks.

This method, if faithfully carried out, will insure as perfect a floor as it is possible to make, leaving a surface smooth and free from cracks and nail-holes.

For floors which are to be carpeted, or otherwise covered, narrow white pine will give the best results, which can be laid several streaks at a time and nailed through. Moreover, it will be easier to tack the covering to, and remove the same at the usual house-cleaning period, than if a hardwood floor is used.

ENGLISH DWELLINGS.—The characteristic English dwelling is described as a two-story brick house, walled in, and with the best part of the house at the back; there are the drawing and dining rooms, while the kitchen and pantries are in front. In suburban and country houses the rooms are large, and are arranged around a hall; but the windows and doors are small. The outside is almost uniformly without architectural decorations, and the dullness of the climate is seen in the somberness of the furniture and the adornments of the house. The interior is dull and uncheery. There is little "sweetness and light" in the colors, forms and expressions, except in the dwellings of more recent building and furnishing. Up to within a few years, the inside finish was all of dark wood, and the furniture was mahogany, of very heavy and ungainly construction. But if you can dissociate the idea of comfort from that of art, the English home has a very marked spirit of comfort. The sofa is easy and big, and the chairs were made to use. The walls are papered—never painted—the papers being dark and of large pattern. The dining-room is the living-room of the middle-class families. Such of the family as remain at home, sit there in the forenoon and until after the noon meal. Were the color of the English house less somber and the furniture less cumbersome, were the rooms more open and less separated from each other, it would be the center of the most perfect exterior comfort known to the domestic life of this world. As it is, the English home is the home of sweet love, of thoughtful civility, and of unforgetting and undying loyalty.

TABLE OF CONTENTS.

ILLUSTRATIONS.—View in a Quarry of Triassic Sandstone; Grand Canyon of the Colorado, 213. View of the Valley of the River San Juan, 221.

EDITORIALS.—Quarrying Sandstone, 213. Passing Events; Magnetic Iron Sands; Quartz Boulders; The Colorado Canyon; The Foundry Strike, 220. The Nicaragua Canal, 221.

CORRESPONDENCE.—The Stewart Mining Bill; The Comstock Lode, 214.

MISCELLANEOUS.—Trusts and Futures; Car and Battery Assays; Coast Industrial Notes; Con California and Virginia; Gold Quartz Mining; The Old Fortuna-Maker; Deep Crosscuts at Butte, 215.

MECHANICAL PROGRESS.—Notes on the Working of Steel; Steel Ties Successfully Tested; To Build Steel Cars; Manufacture of Red Glass; Steel Trusses for Master; Something New in Steam-Engine Foundations; Cementing as a Substitute for Welding, 218.

SCIENTIFIC PROGRESS.—The Tongue of a Snail; Standard of Length; An Oxygen Explosion; Solvent Power of a Liquid; Guns for Fog Signal; Discovery of Platinum and Nickel; The Importance of Minutes; Important Discovery; Lack of Symmetry in the Eyes; Miscellaneous, 219.

GOOD HEALTH.—Mortality Among Railway Employees; Exercise for Chest Development; There is No Harmless Hypnotic; Chills and Fever; Influence of Light on the Human System; Cholera in Asia, 219.

USEFUL INFORMATION.—Continental Deserts; Ornamental Hoses; Soot Outside of Chimneys; Smokeless Powder; New Roses Introduced this Past Year; Ammonia; Preserving Oranges, 219.

ELECTRICITY.—The Storage Battery for Electric Light; Safety of Electric Light; What Electricity Will Do in the Near Future; Another Electric Danger Preventive, 219.

THE BUILDER.—Flooring; English Dwellings, 219.

MINING SUMMARY.—From one various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 215-218.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 224.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, 224.

Passing Events.

In another column will be found a statement of the foundrymen's side of the issues involved in the prevailing strike in the iron business in this city. A great deal of money is being lost by both parties to the contest, but at present there are no signs of any settlement being made for some time to come.

Advices from Washington indicate that there is probability of an appropriation in the River and Harbor bill of \$500,000 for the Sacramento and Feather rivers, and \$250,000 for the San Joaquin river. It looks, however, as if there would be no special Commission to take charge of the improvement of these streams, since the Chief of Engineers wishes his own assistants to do the work.

The commencement of work in hydraulic mining on the Masac concession, Lower California, by Chinese, marks an epoch in Mexican mining matters. This is the first time that placer mining on a large scale has been attempted there, and the first time a big company of Chinese miners has commenced operations.

The rains of this week have still further put off the time for active work in quartz development in California. There is so much water in the ground that the miners have as much as they want to do in pumping out their mines. Just at present very little else is being done in most of the quartz-mining sections. The mountain roads are still in very bad condition, preventing the hauling of ore or supplies.

Magnetic Iron Sands.

EDITORS PRESS:—Inclosed you will find a sample of magnetic iron sand. Is there any place where it is being utilized? Has it any value for being worked into iron and steel? Any information concerning it will be gratefully appreciated.

Santa Cruz, March 22,

JESSE COPE.

The sample referred to is the ordinary black sand or magnetite found on the sea beaches of this coast and in the ancient-river beds. Sand of the same character has been used for making iron in New Zealand and in the South of France, but not with any marked success. A few years ago a large sum of money was spent fruitlessly at Old Sancelito, on the bay shore, by parties who were trying to make iron from the Gold Bluff sands. Oil was used for fuel and quite an extensive plant was built. The enterprise was not a success. The iron made from these sands is of a superior character, but it seems impossible here to make the iron to compete with that made from ore.

The fine sea sand on the shores of Long Island Sound contains goodly quantities of this magnetite. A magnetic separator called the Buchanan (Illustrated in the PRESS Feb. 8, 1890), is used for separating these magnetites from the sea sands. A large plant on the same principle has been sent to New Zealand. Other forms of magnetic separators are utilized for separating the magnetites from crushed ores. At the Croton magnetite mines near Brewsters, N. Y., a magnetic separator is used. The noted inventor, Thos. A. Edison, has devised a machine of this kind which can treat 300 tons a day. The only attempt, on any large scale, made on this coast to utilize these black sands for their iron was at Sancelito. There has always been more or less talk about the possibilities of the industry, but the failure in the instance alluded to has deterred others from making any attempt to utilize the sands. John Birkinbine, 152 South Fourth street, Philadelphia, and Thomas A. Edison, Menlo Park, N. J., are familiar with the means adopted in the East to utilize these sands. The article in the PRESS of Feb. 8th last shows the various forms of magnetic separators.

Quartz Boulders.

A curious strike of quartz boulders has been made ten miles west of Castle Crag siding, Shasta county, on the California & Oregon railroad. It consists of quartz boulders in size from 250 pounds up to large ones weighing tons. The boulders cover an area of 20 to 30 acres altogether. When broken they show more or less gold. Castle Crag siding is between Sims and Lower Soda.

The find was made last fall, just as the severe winter set in, so that little has been done upon it to determine the extent of the boulders. The region is mountainous, and it is supposed that these large pieces of quartz are from a ledge near by, which, however, has not yet been found. We are told by one who has seen pieces of the quartz that some of it is quite rich in gold. There is a great deal of snow in the vicinity still, so that very little work can be done, but the men who have made locations will begin a vigorous search for the ledge as soon as the weather permits. Many of the boulders are very large, indicating that they came from a ledge of magnificent proportions. The adjacent region will be very thoroughly prospected during the next few weeks.

ARIZONA LOW GRADE ORES.—James M. Dawley, formerly of Bodie, is now at Kingman, Mohave county, Arizona, and has started up the mill of the Atlantic Mining Co., a Los Angeles corporation. He is using a Dodge crusher and pulverizer, and writes that the machinery works splendidly, pulverizing from 12 to 16 tons of hard quartz in 12 hours. The pulverizer is one of small size. Everything in and about the mill runs to perfect satisfaction. A Dodge jig and trommel will be added soon to concentrate the tailings from the leach-tub. The ore is leached without roasting, and the natural chlorides leached out; then the tailings from the tub are concentrated, admitting of working to a close percentage. In this way the leaching process gets what the concentrators might lose, and the concentrators get what the leaching might lose. This is the second Dodge mill in Arizona, the other one being at the Grand Prize mine and working successfully.

The yield of the Comstock mines last week was \$133,036, from 6137 tons of ore.

The Colorado Canyon.

NUMBER II.

The observer who, unfamiliar with plateau scenery, stands for the first time on the brink of one of these gorges, is perhaps disappointed, for it does not seem as grand as expected. But when we make comparisons, we realize its proportions. Looking across an abyss to the opposite crest-line, we get our first notion of the reality. Every time the eye ranges up and down the face of the cliff its face appears more distant and more vast.

From the lower end of the Toroweap valley, the scenery becomes colossal. Its magnitude is by no means its most impressive feature, but the precision of its forms. The dominant idea before the mind is the architecture displayed in the profiles. It is hard to realize that this is the work of the blind forces of nature. At the foot of the valley, the western wall is nearly 1500 feet high, the eastern about 2000, and the interval separating them about three miles. Suddenly they turn at right angles to right and left and become the upper wall of the Grand Canyon of the Colorado. The Toroweap valley now opens the main passage-way of the great chasm.

Climbing among the rocky ledge which lie at the base of the escarpment, we at length obtain a standpoint which enables us to gain a preliminary view of the mighty evenness. To the eastward, it stretches in vanishing perspective 40 miles or more. Between symmetric walls 2000 feet high and five miles apart is a plain, which, in comparison with its limiting cliffs, might be regarded as smooth, but which in reality is diversified by rocky hummocks and basins, and hillocks where patches of soil give life to scattered cedars. Of the inner chasm, nothing is yet to be seen. Moving onward on this platform, we find its surface to be mostly bare rock, with broad, shallow basins etched on it, which hold water after the showers. There are thousands of these pools, and they gleam and glitter in the sun like innumerable mirrors. As we move onward toward the center of the grand avenue, the immensity and beautiful proportions of the walls develop. The vista toward the east (see engraving) lengthens out and vanishes against the blue range of the Kaibab, which lies as a cloud upon the horizon.

At a distance of two miles from the base of the northern walls, we come suddenly upon the inner chasm. We are not conscious of its proximity until within a few yards of it. In less than a minute after, we recognize the crest of the farther wall of this abyss, and crane over its terrible brink and gaze upon the water of the river full 3000 feet below. The scene is a type of the Grand Canyon throughout those portions which extend through the Kanab, Uinkaret and Shivwits plateaus.

EXPLOSIVES IGNITED BY LIGHTNING.—During a severe electric storm that swept over the mining pueblo of Hauchaca, in Peru, recently, the lightning struck a magazine, exploding 200 cases of dynamite. The entire works were wrecked. Five persons were killed outright, and 40 more or less seriously injured.

SCHOOL OF MECHANICAL ARTS.—The Board of Lick Trustees have held a meeting with reference to that portion of the Lick trust connected with the School of Mechanical Arts, and will proceed at once to take action with reference to carrying out the decree of the Superior Court.

WATER has been turned into the new flume of the hydraulic mining enterprise of the Lower California Mining Co., working under the Masac concession. The flume, which is five miles long, carries 600 miners' inches of water. Chinese have a contract to work the ground.

MILL BURNED.—The ten-stamp mill of the Standard Mining and Reduction Co., located eight miles south of Prescott, Arizona, was destroyed by fire last Tuesday. The mill was erected about two years ago at a cost of \$30,000, but of late has been in litigation.

BLACK SULPHURET ORE.—A strike of very rich black sulphuret of silver has been made in the Arizona mine at Unionville, Humboldt county. The new strike was made in a hill opposite to one from which several millions of dollars were taken out in the early days.

The Foundry Strike.

A Plain Statement of the Case.

There is very little change in the situation of the molders' strike. The attempt to get one of the men from the East out of the Risdon Works on a writ of habeas corpus was a failure. The allegation that he was restrained of his liberty was denied by the man himself, who had authorized no one to make such a statement for him. The molders have sent back East some of the men who came out, and applied to Senator Stanford for a reduction of fare for others; but he referred them to the railroad officials here. More men are expected from the East, and some of the local molders are going to leave for New York and Chicago. Steps have been taken by the owners of foundries to protect their men and property in case of further trouble, though there have been no overt acts. One of the shops—the Risdon—has now more molders than before the strike, and is turning out work for some of the other foundries. While the molders profess confidence in ultimate victory over their employers, the foundrymen are organized and prepared for a long-continued contest, feeling that the former condition of affairs can no longer be tolerated.

The Engineers and Iron Founders' Association makes a statement concerning the matter which we print in full as follows:

The Foundrymen's Statement.

To all genuine friends of labor.—A true statement of the real cause of the present Iron-Molders' strike:

A statement addressed to the friends of organized labor has been issued by I. F. Valentine, as President of the Iron-Molders' Union. This letter professes to be a true statement of the real cause of the iron-molders' strike. As it is, however, incomplete and misleading in many respects, the employers in question have considered it proper to make known to the public, and also to the iron-workers of this city, what effort has been made to avoid this struggle on the part of their association and also on the part of the proprietors of the Occidental Foundry, where the Molders' Union struck its first blow.

At the beginning, we would contradict the assertion that the association is opposed to labor organizations. On the contrary, the Molders' Union was built up without any opposition on our part, some of the employers, in fact, approving and encouraging its growth and subscribing to its funds.

We will not here state the change in the policy of the Union which has forced us to take a stand in our own defense of our rights. That change will be understood by a careful reading of the preamble to the resolutions which close this article.

Mr. Valentine opens his letter with this statement, that "the signal for trouble was the receipt of a letter from the Iron-Founders' Association on the 13th of December, 1889, setting aside the mutual agreement of August 30, 1887."

Had Mr. Valentine stated the action of the Union which called forth that letter from the Employers' Association, the public and many of the iron-molders themselves would have been in a better position to judge of the real cause of the strike. We will therefore supplement his statement. On Sept. 16, 1889, the Molders' Union sent notice to the foremen of foundries that "They would not be allowed to work on the floor unless they first became members of the Union."

Now, if a foreman, working on the floor, did any injury to the men, was that injury removed if the foreman joined the Union and still continued to work?

No! The movement was simply an effort on the part of the Union to get under its control the last semblance of authority which had been left to the employers in the management of their affairs. The notice was the "velvet paw" which drew the foremen into the Union. The "claw" will be found in Section 5, Article XVI of the Union rules, which we quote:

"Any member who shall use his position as foreman to the detriment of the Union, or any member thereof, shall be fined a sum not less than \$50 nor more than \$200; and for the second offense shall be expelled."

As no Union men would work in the shop with an expelled member, expulsion would practically mean banishment from the State. The foreman is supposed to represent the employer among the men. Should he join the Union and become subject to the above penalties on the complaint of those under him, it can be readily understood that the Union would have secured absolute control of the business.

The McCormack Bros. refused to recognize this order and their shop was struck. As the order was considered by the Iron-Founders' Association to be a violation of the standing agreement (that no change should be made in the trade regulations without first calling a conference), the right of the Union to issue such an order was considered a proper subject for arbitration.

On Oct. 18, 1889, with the consent of the McCormack Bros., the Secretary of the Association was instructed to notify the Union that we were ready to submit the question to the decision of disinterested arbitrators.

On the 20th of October, 1889, a reply was received from the Molders' Union, refusing to accept arbitration as a mode of settlement, on the grounds that the order in question "was one of the fundamental laws of the National Union."

This refusal was in keeping with the statement of the committee of the Molders' Union that "Might made right and they had the might."

We would here state that one of the remarkable features in these so-called fundamental laws is that they are violated with impunity in every city in America except San Francisco. In all cities Union

men work with non-Union men in shops where the minimum rates and limit of apprentices are never heard of. But when the San Francisco employer tries to roll over in his uncomfortable bed and appeal to the justice of the community he is told to lie still—that it is a fundamental law that is crushing him and there is no redress.

In consequence of this refusal and there being no indication of the strike against McCormack Bros. being declared off, the letter dated Dec. 13, 1889, and referred to in the opening of Mr. Valentine's statement, was issued. This letter declared our withdrawal from the old agreement upon which such a one-sided construction was being placed and opened the way for future negotiations.

As some of the regulations enforced by the Union men were found to be working an injury both to the trade and the workmen, a letter was sent to the Union on Jan. 14, 1890, asking a conference, with the view of having these regulations modified. At the conference which followed the condition of the trade was fully discussed and the following proposition was made by the association delegates:

1. That the Union shall, at its next convention, endeavor to secure for the shops a larger percentage of apprentices.

2. That the minimum rate be fixed at \$3 per day.

3. That apprentices, after their time had expired, should work one year under instruction before being entitled to demand the minimum rate.

4. That all limitation on work be withdrawn.

While the association simply asked for a modification of the apprentice rule which allows but one

pay from \$3.75 to \$4.50 per day, and reduce them to the general rate, \$3.50, or ask the restoration of their \$3 men. The latter seemed the only just plan, and it was therefore explained and proposed.

In reference to the limitation of work Mr. Valentine states that, "with the exception of one solitary instance, the Union has never limited its members in the amount of work they shall perform." We will admit that, in only one instance, has the Union placed itself on record in writing in regard to this limitation. We will further admit that it would be difficult to regulate all work; but the end is fully accomplished by Article XIII of the Union rules, which reads as follows:

"Any member undermining, or attempting to undermine, a brother in his job or pieces, shall be fined, suspended or expelled, at the option of the Union."

Under this rule there has been a falling off of work performed. As no man was allowed to do more than the man who had preceded him, the lazy or incompetent man could set the standard for the entire shop. The results of this are shown in that, since the strike, when the spies of the Union were out of the shops, apprentice boys have turned out as much work as was being done by experienced, high-priced men; and men who have not worked at the trade for years are turning out from 50 to 70 per cent more work per day than has been done of late by regular workmen.

After submitting the proposition which we have just explained, the association delegates made the following statement:

decided stand, the following preamble and resolutions were issued:

Preamble.

WHEREAS, The Molders' Union of San Francisco have, during the past few years, made and enforced the following rules in the foundry business in this city: Have forbidden the employment of molders not members of their Union; have forbidden the employment of apprentices, save in the proportion of one to every eight men; have forbidden the payment of a day's wages of any less sum than \$3.50 per day; have forbidden the placing of a shop on short time, when the shortness of the daylight or the dullness of trade might make it desirable to do so; have forbidden the foremen of the various shops the right of working as molders unless they first became members of their Union; have introduced a system of limiting the amount of work a man shall perform; have questioned the right of an employer to discharge a molder who may be an officer of their Union, notwithstanding good and sufficient reasons can be shown for such discharge. And whereas, after a fair trial of these regulations at much cost to themselves, employers find that said regulations are driving trade from this city and throwing men out of employment, thus doing serious injury to both employers and employed; and whereas, employers have called a conference with representatives of the Molders' Union, and requested a modification of these innovations; and whereas, the only response has been a refusal to accept any modification of the objectionable regulations; and whereas, the Molders' Union continues to enforce each and all of the aforesaid rules under threats of strikes, boycotts and

and no man approaches them who may be suspected of being inimical to the molders without running a gauntlet of intimidation.

EXECUTIVE COMMITTEE,
Engineers and Iron-Founders' Association.

The Nicaragua Canal.

A view is given herewith of the valley of the river San Juan, from Fort San Carlos, Nicaragua. The town of San Carlos, at the junction of the Rio San Juan with Lake Nicaragua, is rapidly assuming the proportions of a city in view of its future importance when the canal is built. The proposed route of the canal, laid out by the engineers, is from the harbor of Greytown on the Caribbean sea to Brito on the Pacific. Its total length is 169 miles, of which 38 miles will be excavated canal, 130 miles navigation by Lake Nicaragua, the river San Juan, the outlet of the lake, the basin of the river San Francisco and through seven locks. A canal without locks is impracticable across Nicaragua.

The lake is an inland sea 90 miles long and 35 to 45 miles wide. The lake will be con-

VIEW OF THE VALLEY OF THE RIVER SAN JUAN, THE OUTLET OF LAKE NICARAGUA.

to every eight molders, it is their conviction that such a law should be utterly abolished; as it is entirely un-American in its character, in that the foreign workman is welcomed by our trade Unions with open arms, while the American-born boy is robbed of his birthright, denied the right of learning a trade which would enable him to earn an honest living, and forced to seek associations which must, of a necessity, lead him to the Industrial School or State Prison.

In offering a minimum rate of \$3, we were restoring the rate which formerly prevailed, and which was injudiciously raised by the Union some years ago.

A return to the rates mentioned was decided upon after receiving information from forty different parts of the East, which showed a maximum rate of pay at these points of \$2.75 and a minimum rate of \$2.

The correspondence in this connection was submitted to the delegates from the Molders' Union and they admitted that such were the facts.

In Mr. Valentine's letter the statement is made—"They required us to accept a reduction of fifty cents per day." This would give the impression that a general reduction of fifty cents per man was desired. It was fully explained to the Union delegates that no action of that nature was contemplated. In all trades there are men who are considered third-class workmen, who, in the case of the molders in years gone by, found employment on the cheaper grade of work at \$3 a day. A few men of this class would find work in almost any shop. The raising of the minimum to \$3.50 per day so increased the cost of production that, as a result, we find trade has left the city, and a larger proportion of men are continuously out of work.

To correct this evil, employers had the choice of taking first-class men, whom they had continued to

"We have tried the Union's plan for several years, with the result that the trade has steadily declined, and men have been thrown out of employment. Now, try this plan of ours for just one year, and see if it will not help us to maintain our positions as manufacturers against the steadily growing competition of the East."

In reference to this proposal we will again quote from Mr. Valentine's letter, which states: "They proposed to enter into this agreement with us for one year. It will be seen that at the end of this period we would be caught in the midst of another dull winter season, when the firms would surely demand another reduction. Consequently we declined to accept their proposition."

Now, did ever a man advance a more flimsy pretext for inaugurating an industrial war? No one can doubt that the Molders' Union would have been in as good condition to make a fight next year as it is in this. In face of this fact, Mr. Valentine makes up his mind that further demands will be made by employers next winter, also that next winter will be a dull one, and so justifies the Union in declining the employers' proposition, and in declaring a war which throws a small army out of employment in one of the worst winters California has ever experienced.

It will be seen from Mr. Valentine's statement that the fight is made by him not on account of the present action of the employers, but on account of what he thinks they might do next year.

The refusal of the conference proposition was received by the employers on Jan. 18, 1890. The letter contained no counter proposition; and, hopeless of securing any relief from the Union, all effort to act in concert with that body was abandoned. It being the unanimous opinion of the association members that were they to have any voice in the management of their business, they must take a

other penalties to employers and such workmen as are more reasonable in their ideas; therefore, in consideration of the conditions stated and for the protection of its members in their rights as employers, the Engineers and Iron-Founders' Association of California has adopted the following resolutions:

Resolved, First—That the secretary be instructed to notify the Molders' Union that, while we recognize the right of its members to associate themselves together for mutual benefit, we do not recognize it to the exclusion of molders not members of the Union.

Second—We therefore do not recognize the right of the Union to control us in the employment of non-Union men, nor to regulate the amount of work a man shall perform, nor limit the number of apprentices employed.

Third—That we will not be restricted to a minimum of wages.

Fourth—That all wages be paid by hour, whatever the number of hours worked, and that ten hours constitute a day's work until a less number of hours be generally adopted by foundries east of the Rocky mountains, when the same number of hours shall be the day's labor here.

Fifth—That overtime be paid at time and half, Sundays and holidays as double time.

In conclusion we would state that the members of the Molders' Union having resigned from our employ, and we having accepted their resignation, our relations should end there; but the molders now deny the right of any men to work in the places which they have vacated. Recognizing our right to have any man who may desire to work for us, we propose to protect them in that right to the full extent of the law.

Notwithstanding the constant declaration that their motives are peaceful, their actions are such as to be a menace to the public peace.

The iron works in this city are in a state of siege,

coated with the Pacific by a canal and with the Atlantic by saltwater navigation in the river San Juan by a short section of canal from the river San Juan to the basin of the river San Francisco, and by a canal from the eastern end of that basin to the Caribbean sea.

THE MECHANICS' FAIR.—The Board of Trustees of the Mechanics' Institute have announced that the 25th Industrial Exposition under its auspices will be held at the Mechanics' pavilion, commencing Aug. 19th and closing on Saturday evening, Sept. 27th. The trustees solicit exhibits from every department of invention, industry, art and the natural resources of the coast.

THERE is some excitement at Tacoma (Wash.) over the discovery of gold in Gallagher's gulch, at the south end of the city. The State Geologist is not excited, however, and says he does not think there is gold enough there to call the land mining property.

It is stated that over half a million dollars has been invested of late by London capitalists in Lower California mines.

FOREIGN varieties of coal are very scarce in the market.

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and disc.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other crushing machines now before the public.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery.
Adapted to heads running from 20 up to 2,000 feet.
From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 hp to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and In Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, March 27, 1890.

General trade continues fairly active, with the volume of goods going out showing a steady increase. This will be still more marked when the valley and mountain roads become more passable. With foundrymen and machinists there is nothing new to report. The iron-molders' strike is still on, which naturally interferes with work. It is claimed that the strikers' places will be filled by non-union men. It now looks as if both sides have settled down to a recognition of a final struggle for supremacy—one fighting for principle and the other for a chance to turn out work against Eastern competition.

The local money market is easy, with remittances coming in fairly free, while the demand is light. With settled weather the unemployed men are securing work, and the future is more bright. There will soon be a call for men from the mining districts, where but little has been done, owing to a scarcity of water. The large deposits of snow guarantee an ample supply of water throughout the year for all kinds of mining.

MEXICAN DOLLARS.—The demand is light. The last steamer for China took out \$47,781 to Hong Kong.

The market for Mexican dollars closed dull at 75 1/2 cts.

SILVER.—The foreign market has ruled strong throughout the week, while at the East an advance has been established. On this coast the supply of bullion is quite light, or at least the Mint finds considerable difficulty in getting it, owing to tight offerings. There is no denying that the output on this coast, not considering Montana and Colorado, is less than at this time last year, while it looks as if there will be no considerable increase in the near future. The Tuscarora mines, which promised so much when they were dealing the stocks, are turning out but little bullion. Of course plausible excuses are given for the poor returns. The Comstock stocks are gradually going into gold, with the percentage of the latter promising to largely increase in the near future as work in the mines is pushed to the west. The Arizona silver mines are not showing an increased output.

The Windmill has been favorably acted on by the House Committee. A favorable report by a House Committee is, at this session, equivalent to a passage in that body. The objectionable sections have either been eliminated or else amended so as to make the bill acceptable. Our advisers abroad indicate that the action of Congress is being closely watched, and if the bi-metalists are successful, more favorable action will be taken by England and Germany.

The Mint paid for silver the past week 95 2-5 cts. London cables quote that market at 43 13-16d.

QUICKSILVER.—Receipts the past week aggregate 137 flasks, and exports by sea 195 flasks to Guaymas and 25 flasks to Mexico. The market is very strong, with a good home demand ruling. English advices from Southern Africa report a discovery of cinabar mines, but how extensive is not reported. English mining papers are very hopeful from the advised prospects.

ANTIMONY.—The market is fairly steady. Several mines are said to exist in this State not heretofore worked, owing to the price being too low. Now that the market is high and likely to remain so, capital looking to their development would be well invested. The Saota Madico mine, 40 miles south of Baker City, in Kern county, has all the machinery ready for active work.

BORAX.—Receipts the past week aggregate 418 cwt., and exports 32,540 lbs. to St. Paul and 362 lbs. to Guaymas. The market is reported firm, with a good demand ruling.

LIME.—Receipts the past week aggregate 4179 bbls., and exports by sea 850 bbls. to Honolulu and 100 bbls. to Mahukoma. The home consumption is steadily increasing.

LEAD.—The market is about as heretofore reported. Lead plate manufacturers report that their requirements will be larger than in 1889. At the East, the situation is virtually unchanged.

TIN.—The market for plate continues demoralized. It now looks as if there will be free consumption by canners for both fruit and salmon. For pig the market is fairly steady. English advices report a firm market for pig, but unsettled for plate, owing to the combination to reduce the output not being formed. If this is successful, better prices are looked for. At last advices, 62 works were idle.

IRON.—The market is essentially unchanged. Large holders do not appear disposed to make concessions, believing that large consumers will not be obliged to restrict their work much, if any. English advices lead to the impression that another speculative movement is contemplated, based on lessened stocks.

COPPER.—There is nothing new to report in the market. The syndicate holdings at the East have been placed, which is calculated to strengthen the market. A special cablegram to the Iron Age reports the English market on March 19th as follows: Copper, after declining somewhat, advanced to 47 1/2 s, on considerable improvement in the cash demand, and on Thursday as high as 48 was paid for prompts. Since then, however, there has been a reaction of 47 7/8. A large part of the warrants circulating on the market lately has been absorbed by consumers, and the prospects are considered brighter. Stocks decreased 2000 tons during the first half of the month. Recent sales of furnace material include 100 tons Montana Matte at 10s., 100 tons ditto on private terms, and 1675 tons Aconada Argenterous Matte, private terms; all at Liverpool.

COAL.—Receipts the past week aggregate as follows: Coos Bay, 1450 tons; Seattle, 6100; Departure Bay, 5555; Tacoma, 2400; and Port Townsend, 1204; total, 16,659 tons. The market rules firm for steam under light supplies. Very little can be added to our last week's report. In house coals the market is kept steady by the scarcity of steam and the fear that before Australia begins to send us liberal supplies some accident might occur to one or

more of the leading collieries on this coast and our coast supplies lessened. The consumption of steam is quite free, but of house it is lessening. There are six vessels with cargoes on the way from Newcastle, N. S. W., of which number three are about due. From Sydney there is one vessel due. The number of vessels listed for this port and not yet left are three at Newcastle, N. S. W., and two at Sydney.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their Scientific Press Patent Agency (S. F.), from week to week and year to year.

Attention, Southern California Miners.

WORKS FOR SALE.

The Works are situated at Daggett, Cal., in the Calico Mining District, and on the side-track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power Engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to GILLISPY & CHILDS, 123 California St., San Francisco.

Testing and Working Silver Ores

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of chloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes his methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Kroehnke's process, etc. Under "Pulverizing Machines" are described the arrastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improved retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous motion may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, \$2.00. Sold by DEWEY & Co., Publishers, 220 Market St.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1890.

This rare book on the treatment of gold and silver ores without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, cloth, postage free. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco, Cal.

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY & Co., S. F.

Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, Jr.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining alluvial and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hardy-guards, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by DEWEY & Co., Publishers, 220 Market St., San Francisco.

Paul's Dry Amalgamating Process

Will work gold ores to a high per cent, and gather flour gold with the same readiness as the corner whether free or associated with iron, copper, lead, antimony or zinc, or altogether in one matrix, and produce bullion free of any or all of the base metals, less natural alloys. It will work silver ores, carrying any of the base metals, to a higher percentage than any system of raw amalgamation, and produce bullion 950-1000 fine. For particulars address ALMARIN B. PAUL, Middle Creek P. O., Shasta County, Cal.

A MIDDLE-AGED MAN BY THE NAME OF JOSEPH McLEARN, Miner, left Nova Scotia 17 years ago for California. His friends would be thankful to any person who could give any information concerning his whereabouts.

THOROUGHLY COMPETENT MILLMAN AND Assayer of 30 years' experience in putting up and running Gold and Silver Mills and Concentration Works desires a situation in Mill or to take charge of Mill and Mine. Best References. A. H., Box 2517, San Francisco.

Dewey & Co.'s Scientific Press
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

CHEAP AND CONVENIENT CHAIN PULLEY

The engraving herewith illustrates a new lifting apparatus of that kind in which great power is necessary, and which will stand and hold the load at any point where it is left. As the engraving shows, there is a pulley over which the lifting chain passes, and upon the same shaft two gear wheels, so fitted that their teeth alternate — that is, the teeth of one wheel correspond with the spaces of the other. The pulley on the right, over which the endless actuating chain passes, is fixed to a shaft, which has short crank arms formed upon it, corresponding with the gear wheels and with the size of their teeth, so that when the shaft is rotated the crank arms or pins engage the teeth of the gear wheels, one after the other, and thus advance the chain pulley. This device also forms a perfect lock when left at any point.

The holding-chain pulley, placed between the large gear wheels, brings the weight right under the supporting hook and balances the machine. The operator may stand on one side and haul on the chain, and need not be right under the apparatus. The device is simple, compact, strong and effective, and is quite ingenious in design. These machines have lately been put on the market and are made here. The invention evidently improves, in a large degree, the construction of differential chain pulleys, makes them less in cost, weight, wear, and repairs, and easy of handling and operating. The new device is worthy of the attention of manufacturers and all users of such articles. The size for a half-ton lift weighs only about thirty pounds.

THE ECKART ROLLS FOR CRUSHING ORE.

The Eckart Rolls.

The Eckart ore-rolls shown in the cut are built for extremely heavy work by the Union Iron Works, and are strong and substantial in every way. The main shafts and body of the rolls are in one piece, with a hole cored through

the center. The hearings that carry one of the rolls are bolted to the bed-plate with oblong holes and can be set up by the set-screws shown in the end of bed-plate; while the hearings that carry the other roll are kept up in position by the double circle of steel spiral springs. The tension on these springs can be adjusted by

the bolts and the set-screws in the bottom of the cast-iron head. Large pulleys are keyed direct to the shafts, one on either side, by which the rolls are driven.

The smaller cut shows the way in which the white iron shell is held on to the roll. There are a number of wrought-iron strips cast on the

inside of the shell so it can be bored out. The shell is bored out tapering and the roll turned to suit. The roll is cored for the bolts as shown in the cut. The shell is also cored for the bolt-heads; and the shell is slipped over

SECTION OF ECKART ROLL.

the roll and drawn tightly up on the taper portion by the bolts, at the same time the heads of the bolts form so many keys. It is securely held and easily removed.

A New Centrifugal Quartz-Mill.

On this page is shown a view of the new centrifugal quartz-mill invented by Philip Hinkle of this city, and recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency. There is no oil used in this mill, the roller-shafts, slides and other inside working parts being lubricated with water. The engraving shows a circular supply-tank which is connected with the roller-spindles and supplies with water, by means of rubber hose, all the inside working parts of the machine.

The pan-bottom is cast with low flaring sides, within which is fixed a similarly-shaped flaring ring-die. The inner portion of the pan is made concave from below, and in the center is a conically shaped hollow sleeve through which the vertical driving-shaft extends. To the lower end of this shaft is secured the bevel-gear, which is set well up into the concavity of the pan, admitting of the pan being set very low. To the upper end of the vertical driving-shaft is fixed a carrier which extends down outside the hollow-shaft casing and is thence inclined outwardly so as to correspond with the inclined bottom of the pan. The carrier has radial slots formed in it which act as guides for the slides, which are fitted into these slots so as to move to or from the center as required. These slides serve to support the shafts, which are fixed in them and extend upwardly at right angles to the slides and within the inclined bottom of the pan.

Upon the tops of these guides are fixed steel plates which steady the sides, holding them in place and also preventing them from being clogged.

Upon these shafts are fitted the grinding roll.

HINKLE'S CENTRIFUGAL QUARTZ MILL WITH PLATES AND "SLUMMER."

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

The Stewart Mining Bill.

A Defective Measure Criticized.

(Concluded from last issue.)

In making it imperative, under the penalty of forfeiture, that an affidavit should be filed for assessment work done on every mining claim, a heavy and needless burden will be laid on the prospector and moneyless miner if the proposed legislation is adopted.

Take the case of an illiterate man, who for years has been holding mining ground 20 miles away from a notary public, and 70 miles from the county seat, and generously and fairly consider how this requirement would affect his interests. He has been enabled in the past, perhaps, to do his work only by hiring himself out to some neighboring employer for low wages, his hope being that some day he will succeed in making a sale. In order to comply with the Stewart bill, he would be compelled to spend money and time in having affidavits prepared and recorded, and nobody would be benefited save office-holders.

If the purpose is to compel claim-owners to do their work and cease to relocate them, it is in one sense commendable enough, but it will not have that effect. On the contrary, it will increase relocating so as to avoid the additional expense, and Mr. Stewart and his restriction laws will be treated with jound derision. If a prospector fails to do his work, and his claims are known to be good, there are always men ready to take advantage of his delinquency, and if he is willing to risk the loss of his property, why should the law put him to a useless expense? Is the pre-emptor or homesteader of land required at the end of every year to file an affidavit as to his work? No; when he "proves up" in the Land Office, that is enough, and so when a lode is to be patented, the certificate of the mineral surveyor as to work ought to suffice.

If the owner of mining claims is able to file the necessary papers, by all means let him do it, but to decree a forfeiture of his rights, if the certificate as to work is lost on the way to the recorder's office, as would be the case under the Stewart measure, is unjust and cruel.

Another Unwise Proposal.

The Stewart bill, if passed, would make it legal to file affidavits relating to mining titles with local district recorders, in lieu of filing them with county recorders. The books of the former are usually kept in cabins where there are no safes, and in most districts the office is not long held by any one person. As such recorders are not under bonds and are not always reliable, the proposed jeopardizing of titles through the contingency of erased words, torn-out leaves or burnt books, is quite in keeping with several of the other "amendments" presented in this inexplicably strange effort at mining legislation.

A Change in the Tunnel Law.

Under Sec. 2323 of the present law a sort of tunnel charter is granted to miners, and by an amendment approved Feb. 11, 1875, work done in a tunnel was made applicable for assessment purposes to such lodes as it would develop. This amendment, however, was made to relate to Sec. 2324, and did not specify anything in regard to Sec. 2323. As Senator Stewart's bill amends 2324, it cancels the amendment of 1875 by the following substitute: "When any person or company has developed and exposed a lode, and expended a hundred dollars' worth of labor thereon, said person or company may run a tunnel for the purpose of developing such lode owned by said person or company, and the money so expended in said tunnel shall be considered as expended on said lode, and such person or company shall not thereafter be required to perform labor or make improvements on the surface of said lode in order to hold the same, so long as work is continued on such tunnel."

It may be well to give a copy here of the law now in force to show how a really good measure is to be "amended" out of existence by the Stewart scheme:

"Where a person or company has or may run a tunnel for the purpose of developing a lode or lodes owned by said person or company, the money so expended in said tunnel shall be taken and considered as expended on said lode or lodes, whether located prior to or since the passage of said Act, and such person or company shall not be required to perform work on the surface of said lode or lodes in order to hold the same as required by said Act."

The above enactment, it will be observed, is liberal. It in effect says to the mine-owner: If you want to concentrate your work for a number of lodes on a centrally located drainage tunnel, you shall be allowed to do so, and not be compelled to waste your time and money in digging useless surface-holes on your various claims. But contrast the Stewart tunnel proviso with the foregoing. Notice that it relates to one lode and no more, the effect of which limitation would be that if a tunnel was being opened for six claims, surface work would have to be done on five of them each year, no matter how far the tunnel had been extended in the interval. I have never heard of any complaint being made against the existing tunnel law, and why such a radical change should be pro-

posed is something of a mystery. Observe also what queer language our would-be law-maker employs. "When" a claim-owner has "developed" a lode—that is, when he has opened it—he will be specially permitted to run a tunnel for the purpose of "developing" or opening it. How liberal he is, too! "When" a person has spent a hundred dollars on the surface of one claim, he may then, but not before, begin a tunnel for it. When he has disbursed on a second lode one hundred dollars more, he will be allowed to begin a second tunnel, and so on, for every claim he owns he has the right conceded to him by our great law-giver of starting a tunnel for it.

This of course is all very absurd, but it is the proposed law, and not the interpretation legitimately belonging to it, which deserves to be so designated.

Further, let the reader notice what profound wisdom Mr. Stewart displays in the last nine words of his "amendment." The man who does not "continue" every day and every month in the year to work on each tunnel that he has begun is liable to have his claims "jumped," for their title is good only "so long as work is continued on such tunnel" or tunnels. Verily, the less a mine-owner has to do with a Stewart tunnel the better it will be for himself.

But can any sound reason be given for restricting tunnel privileges and rights to either one lode or even to five lodes? In all great mineral belts there are places where the veins fail to appear on the surface. Between two ore-bearing portions, five or ten miles apart on a given belt, there may be very little surface evidence to prove its continuity or value, and yet "indications" may be found to induce capitalists to tunnel some intervening mountain, in the hope of cutting concealed lodes.

Would not it be a wise thing to encourage a great prospecting work of that kind? The result of success would be the creation of a new industrial center and an addition to the available resources of the country. It would be the means of making a worthless mountain the source of wealth to individuals, to the nation, and the world at large. Our present liberal tunnel law gives that encouragement, and the time is coming when advantage will be taken of its liberality to an extent not dreamed of at present. But here Senator Stewart steps to the front, and with his one lode tunnel measure attempts to check mining enterprise. He is incapable of offering any adequate reason for the proposed change, and surely the miners whose interests are to be affected ought to be heard on the subject. It is wholly a retrograde movement which he has started, involving a total reversal of the heretofore liberal policy of our Government toward the mining community.

As our great mining interests are extended, a time will come when tunnels will be opened primarily for drainage purposes, as was the case with the Sastro tunnel, which, contrary to anticipation, is proving of immense advantage to the Comstock mining companies.

In a mountain where a dozen mining incorporations are operating there will be a time when water wholly unmanageable from the surface will have to be carried off by a union tunnel if further progress is to be made. Under the law as it stands now, united action and a general protection of separate interests would be assured in such a case, and an application for a special tunnel charter would be unnecessary. It is needless to describe how effectually the passage of the Stewart bill would cancel all such mining advantages and offer nothing in their place.

Another Bad Change.

The first part of Section 2335 of the proposed bill reads as under:

"All affidavits required to be made under this chapter may be verified before any officer authorized to administer oaths in any State or Territory of the United States, or in the District of Columbia, and all testimony and proofs may be taken before any such officer, and when duly certified by the officer taking the same shall have the same force and effect as if taken before the register and receiver of the Land Office."

The words in the above which I have put in italics are substituted for the following in the law of 1872: "Within the land district where the claim may be situated."

If there is a conflict of title now between a New York mining company and certain miners in California, testimony must be taken in the latter State, but under the Stewart bill the Eastern company could force their opponents to appear for the taking of testimony in any distant place they might choose to select. If a certain western land district is considered a good place in which to acquire mining property on behalf of distant capitalists, it ought also to be regarded as in every way a suitable locality to take testimony in relative to it. The contemplated change is entirely in the interest of non-resident mine-owners, and should it become a law it would involve local litigants in endless trouble and expense. Under it they could be worried and injured in a way which at present is impossible.

Stewart's Influence.

From the fact that Senator Stewart has been regarded as the author of the mining bills of 1866 and 1872, he has acquired an influence in Congress when he deals with mineral questions to which he is not justly entitled. This influence was shown on April 24, 1888, when the Senate passed the mining bill introduced by him on Feb. 7th preceding, without debate or protest. It seems as if this display of confidence made the Senator believe that the time

had come when he could erect a monument for himself in the form of a hill to govern the locating and working of mines about the authorship of which there could be no dispute. To attain his purpose he saw that it was necessary to lure mine-owners and prospectors to slumber by pretending that what he was attempting to do was in their interest, and necessarily, therefore, he would be glad of their aid in enabling him to produce a "perfected" measure. That he meant from the first, and means now, to force a bill entirely of his own concocting on the country, before his plans could or can be exposed, is shown in every step that he has taken. A critical examination of his bill proves conclusively that he could not be and was not the author of the laws of 1866 and 1872. The master mind, which left its impress on these measures, and particularly on the latter, was that of a thoroughly practical miner and prospector, who could foresee how every requirement he suggested would work when applied in the field. He probably was some humble, unknown pioneer in whose judgment and proposed enactments the framers of those measures had full confidence, and hence the general working excellence of the existing law. But the self-confident law-maker of to-day will take no advice and dashes ahead seemingly unconscious of the fact that he is displaying in the sight of practical miners his utter incompetency to deal with the subject in regard to which he professes to be a master.

The Few Defects

In the law of 1872 are too insignificant to warrant the complete overhauling which Mr. Stewart proposes to give it. The rulings of the Land Office and decisions of the courts are so generally understood and recognized that to unsettle them by new enactments couched in uncertain language would be a heinous blunder. If it cannot be perfected by a few short amendments but must be tinkered at all over by an unskilful hand, it will be better not to touch it at all.

Some of the Stewart proposals are good, but they are too unimportant to redeem the bill as a whole from condemnation. His plan to make the assessment year begin on October 1st is commendable, as also his provision that ore-bearing rock in place should be held as affording satisfactory evidence of land being mineral in character. In giving right of way to tunnels, canals and ditches through or over adjoining claims, he also made a good proposal. These are trivial matters, however, whereas the changes attempted in other parts of the law are so radical that they would, if adopted, destroy its most liberal and beneficial features.

Suggestions to Miners.

In this long article I have tried to deal with the Stewart bill so that readers of the PRESS, practically interested may know just what it is and act accordingly. If I have made it plain that the passage of the measure would be injurious to our great and growing mining industry, steps ought to be taken at once by miners' meetings, by appealing to local journals, by petitions, and by bringing pressure to bear on members of Congress to oppose and defeat it.

If the PRESS will, as the miners' organ, enable me to bring the case before the public, I have confidence that Senator Stewart will be made to understand that as a single-handed legislator capable of going down into the lower levels and drifting along the subtle veins of our mining policy he is anything but a success.

General Summary.

The Stewart mining bill ought to be rejected for the following valid reasons:

1st. It prevents a discoverer even of a new mining district from locating more than one claim on a lode, and gives loafers a chance to locate extensions and wait for him to develop a mine for their benefit. It also prevents him from meeting the demands of capitalists for groups of claims which can be opened by central works and where litigation by adjoining claimants would be impossible.

2d. It prevents a miner from correcting a defective location by making a re-record, and invites "jumpers" to hunt up and relocate all imperfectly described lodes.

3d. It does away with the requirement now in force, that a location should be so described relatively to fixed natural objects as to prove its whereabouts, and substitutes an indefinite description, which, if adopted, would admit of "floating" claims being taken up such as were productive under the law of 1866 of endless litigation.

4th. It entirely relieves the rich man who spends \$1000 in some undescribed way for the benefit of five placer claims each of 160 acres, or of an equal number of lodes, from working on any of them, whereas the poor prospector who does not possess that sum or cannot undertake so much work, must do \$100 worth of hole-digging labor on each of his five ledges or his title thereto will lapse.

5th. It changes the present law which most beneficently gives the owner of a series of veins the right to concentrate his work in a tunnel, or on one of them, and substitutes a measure under which credit for assessment labor in a tunnel would be allowed for one lode and no more, and surface work would have to be done on all the others of the series, even if during the year there had been a thousand feet of tunneling done for their development.

6th. It requires under the penalty of forfeiture that every claim-owner, no matter how far he may be from a notary public or the

county seat, should record an affidavit for the annual work done on each of his lodes, and if such affidavit is lost on the way to the recorder's office, the claim it relates to will be subject to relocation.

7th. It proposes to legalize records as to forfeited titles and affidavits when they are made with local mining recorders, thereby ignoring the fact that such records are liable to be burnt, lost, or changed, and that mining titles might in consequence be imperiled.

8th. It will enable mining incorporations in distant States to compel litigants in the mining districts where they are operating to appear wherever they are pleased to command them for the taking of testimony, whereas at present this must be taken in the land district where the mines are situated; and

Finally. The changes proposed in the mining statutes by Senator Stewart would, if adopted, not only promote litigation, but would compel the Land Office to issue new rulings and would also keep the courts busy for years to come, trying to discover their meaning. In place of improving the present law, they would greatly injure it and check mining operations. Should this measure pass, it requires no prophetic power to foresee a time, not far off, when the cry for its repeal would prove irresistible. JOHN DARE EMERSLEY.

Gold in White Pine, Nev.

A correspondent of the Salt Lake Tribune, writing from Ely, Nev., says: The Johanna mine, the property of H. R. Watson, is situated about two miles from the town of Ely, up Robinson Canyon, and is just on the north side of the old Aulman mine, and it is just one mountain of gold-bearing ore, with not over three feet of lime and soil on the top of the ore. I have worked in the Richmond mine in Eureka in its best days, in 1873 and 1874, and I assure you I never saw as large a body of ore in it as is this day in sight in the Johanna, and the beauty of it is the ore is right in the side of the mountain and can be mined very cheaply. The price of extracting the ore at the present time does not exceed 50 cents per ton. What ore is needed at the present time, 35 tons per day, is taken from two tunnels. One of said tunnels is running up the canyon to the west, the other right into the mountain to the south. Each of said tunnels is 10 feet high and about 10 feet wide. The ore is very heavy in iron, with seams of quartz and carbonate, no lead, and is working up to 90 per cent with a 10-stamp gold mill. The mill is situated in the town of Ely, and is run by a water-wheel. The mill is rented by Mr. Watson for \$16 per day, by the way, a nice income to its owners. The battery assay of the ore is \$22 per ton in gold, but right in the center of the Johanna and dipping to the east or down the canyon is a seam or small ledge of ore that is enormous in richness. I myself from a small pan of dirt have taken over \$5 in gold. I visited some other mines in this district, and I never saw more favorable prospects in my life. But the most of the ore I saw outside of the Johanna is rebellious, and, in my opinion, cannot be handled by a milling process. What is needed in this camp is a large furnace and an able management that will purchase ore from us prospectors and give us living prices for our ores, and I know from what I saw of the mines there are thousands of tons of lead ore that can be purchased very cheap here that will pay large profits to a smelter, and coal can be had for several years within ten miles of the town of Ely.

FOR THE LICK TELESCOPE.—The Lick telescope will, in a few weeks, be supplemented by a remarkable piece of mechanism. This is an eye-piece which has just been completed at Rochester, N. Y. No other eye-piece of anything like equal dimensions has ever been made. The largest now in use is not over two inches in diameter, while the new piece measures over three inches. The eye-piece is constructed on a perfect theory. There are two lenses, six inches apart. The larger one is called the field lens, and is 6½ inches in diameter. The other lens is the eye-glass proper. It is composed of three lenses, a double concave, a double convex and meniscus, cemented together. The field lens is of brown glass. The meniscus or correcting lens is of flint glass. The light from the heavenly bodies seen through the Lick telescope with this new eye-piece will be 2000 times as bright as that seen with the naked eye.

A MINING BOOM.—A mining boom is reported in Singapore. In the river Luait, in Pahang, large deposits of placer gold have been found. The percentage of gold-dust in this spot has made an average of 60 to 70 ounces per cubic yard. The mineral is pretty largely in flat formation and of a reddish color. Pahang has long been known as the richest of the Malay provinces in gold, and it is predicted that shares in this concession, which are now selling at \$10, will reach \$1000.

ON the authority of the London Times the vein of uranium recently discovered in Cornwall, England, the works for reducing the ore are turning out half a ton per week of that rare metal, the market value of which is \$2000 per ton.

THE placers on Lee Vining creek, near Lundy, are to be worked by the hydraulic process this summer.

The Deep Gold Placers of California.

NUMBER 1.

[Written for the Press and Copyrighted 1890, by HENRY G. HANKS, F. G. S. A., F. G. S.]

This paper has been prepared to advance a new theory as to the origin of the deep placers of California, which is presented as a substitute for the ancient-river theory, found to be defective. While it seems to me to account for nearly all known conditions, it will doubtless in time be modified as new facts are discovered. If it should renew attention to the unexplored storehouses of gold which exist in our State, and lead to a more careful study of their geology, its object will be accomplished.

The Ancient-River Theory.

From the date of their first advent, the gold-miners of California began to theorize as to the source of the gold they were seeking. Many believed in a distant fountain-head, difficult of access, high up in the snowy mountains, where virgin metal lay in a natural treasury as Nature created it, from which the nuggets and gold-dust they gathered with so much toil, had wandered.

With this idea always in view, they were the more ready to believe stories rife in those pioneer days. This accounts for the historical gold excitement and mad rushes, of which Gold Lake, Gold Bluff and Frazer river were types. These and many more will be remembered by pioneer California miners.

The Australian gold-digger, like his Californian prototype, believed that a locality existed where gold could be cut away with chisels, and he sought it with the same visionary energy that led to the swarming of miners to newly discovered gold-fields.

Beside their camp-fires, after the toilsome labors of the day, miners would speculate also as to the origin of the gold, and plan to overcome the difficulties which lay in the way of its possession. So miners and prospectors continued to day-dream and theorize, nor will they cease to do so as long as gold-mining continues.

Among the numerous ones advanced, that known as the "Ancient-river theory" has been most generally accepted. But as the auriferous deposits became better known, many objections were noted, and it is uncommon at the present time to find an intelligent miner who does not wholly reject it or retains it with doubt. It will not add to the interest of this paper to repeat what has been so often published; the main features of the theory, however, may, for the benefit of those not familiar with the subject, be briefly stated as follows:

The old river theory assumes that during the Pliocene epoch, or earlier in the Tertiary period, the climate of this portion of the earth's surface being favorable, great rivers, as large as the Mississippi, the Ganges or possibly the Amazon, flowed with great rapidity, at an altitude now about 5000 feet, whatever it might have been at that time, and brought from some far-away, mythical source a vast quantity of gold, associated with fragments of quartz which the waters are supposed to have torn by sheer force from their natural beds. These quartz fragments, and the silts resulting from their disintegration, were generally blue, which gave the name "the blue lead" to the deposits. The tumultuous waters ground the rock masses to boulders, in which form we find them where the rivers finally placed them with the gold.

While the rivers were thus employed, their waters were in a turbid condition from gravel, coarse and fine, held in suspension, which was precipitated on the boulders. The streams, then, for reasons not fully explained, ceased to exist and became "dead rivers."

A period of great volcanic activity followed, and the surface of the country including the dry river beds was covered by an inundation of red-hot, liquid lava. The volcanoes from which these eruptive streams flowed are variously located; some theorists naming Mount Shasta, others Mono lake, while still others trace the lava streams to distant Alaska and refer as evidence to the basaltic cliffs of the Columbia river.

It is my opinion that evidence does not warrant the retention of this theory.

The New Theory.

In the MINING AND SCIENTIFIC PRESS of June 29, 1889, I published the following preliminary notice, which briefly states the new theory:

GOLD IN DEEP PLACERS—A NEW THEORY OF ITS DEPOSITION.

EDITORS PRESS:—During a recent visit to the drift-mining districts near Laporte and Gibsonville in Plumas and Sierra counties, I made certain discoveries which suggested a new theory as to the deposits of heavy gold and worn quartz boulders lying invariably beneath lava ridges, which to my mind must replace the ancient-river theory so long held in California. This theory was foreshadowed in my second annual report as State Mineralogist, 1882, folio 98.

I have in preparation a paper which it is my intention to publish in the PRESS with illustrations, giving my reasons for so thinking. I send you this preliminary notice to secure priority.

The substance of my theory is briefly as follows: The channels are lake-beds scooped out by glaciers that in course of time retired to mountains of greater altitude, continued their work during a long period, and finally became extinct.

The bedrock at this locality being soft clay slates, mica schists and argillaceous shales filled with small quartz veins containing gold, was reduced to mud and washed away, leaving the harder quartz in rounded boulders with the coarse gold in the lake-bed,

which was still filled with water. Rivers like the Rhone in Switzerland, brought down from the still active but distant glaciers, crushed quartz, and for many centuries deposited it in the lake, covering the bottom with what our miners call "pipeclay." The lake and the low mountain-tops were subsequently covered by an overflow of eruptive mud, the so-called lava. Modern rivers which still flow in their channels, cut down through the lava, the gravel deposits and deep in the soft underlying bedrock. That position between the rivers protected by the lava became rounded ridges, and a portion still left as a floor remaining on the summits of the mountains are "table mountains." The channels so called are the intact lake-beds and the present drift mines. The new river channels are the placer mines of the forty-niners and hydraulic mines of past history.

It is my opinion that the contents of the channels came from a small area, and were not brought from a distance, as generally supposed. The blue quartz which imparts a general character to these deposits I found in place near Gibsonville, as I did also all the boulder rocks common to the deposits.

That there were numerous lakes of this character I am prepared to believe, but on reducing the lake of Geneva to the same scale as my map, I find it to extend from Pilot Peak to Nevada City, and to cover most of the important drift and placer mines between those two points.

Assuming that such a lake existed, I have named it Lake Tra-la, from the first State Geologist of California, who made this subject a special study and nearly discovered the facts to which I allude.

HENRY G. HANKS.

Figs. 1, 2 and 3 are ideal sketches made to illustrate the new theory. In these, perspective has been disregarded. Fig. 1 is a view of the ancient lake, left by retreating glaciers still active in the distant mountains. From the surface of the lake downward is in section. The irregular, deeply-channelled lake-bed was scooped out by the ice is thus shown; it is supposed to be strewn with quartz boulders, among which lie scattered the native gold. During this period the pipeclay and fine gravel were deposited.

Fig. 2 is the same lake-bed now covered by earthy eruptive matter (A), the so-called lava. From the surface of this formation downward is in section; under the lava the lake-bed is shown (C).

Fig. 3 shows the result of geological changes which have produced present conditions; modern rivers have eroded the channels B B B now deep in the bedrock, in which pioneer miners first sought gold; C C is the same lake-bed now filled with material described elsewhere; D D are portions of the lava intact, forming table-mountains; E is a rounded ridge of the same; F F F F, placer and hydraulic mines; and G G G G, drift mines reached only by tunnels.

It will now be my purpose to give in detail the reasons which led me to draw these conclusions.

Arguments Advanced by the Ancient-River Theorists.

It is claimed that rivers flowed in the ancient-river channels because pot-holes are found in the exposed bedrock of the hydraulic mines and in the tunnels and breasts of drift basins; for the reason that magnetic sands are seen to have collected under the lee of large boulders lying on the bedrock; and because these boulders sometimes overlap like shingles on a house-top, the small ends pointing generally down the grade. The washed or rounded quartz boulders, the gravel, the pipeclay, the silicified and carbonized trees in the gravel-banks, and the gold itself, are assumed to be evidences of fluvial deposition.

It is also argued that the numerous writers on the subject could not be mistaken; these authors will be quoted when it is desired to inform the reader upon what grounds their opinions were based. It will be shown that all the facts stated above may be freely admitted without detracting in any degree from the validity of the new theory.

W. A. Goodyear, in an article in the *Mountain Democrat* quoted in the MINING AND SCIENTIFIC PRESS, Vol. 23, 1871, fol. 329, wrote as follows: " * * * There is but one possible agency which is at all capable of satisfactorily accounting for the complex and intricate phenomena, and that this is to be found the action of fresh and running waters." * * * These views will be thoroughly discussed in the forthcoming report of J. D. Whitney.

Prof. J. D. Whitney ("Auriferous Gravels of the Sierra Nevada of California," Cambridge, 1880), fol. 241, thus strongly expresses an opinion, the exact reverse of mine: "The gravels were then, as now, the result of fluvial action. The rivers which did the work of rounding and polishing the innumerable boulders and pebbles which these older deposits contain are doing the same thing now, although with diminished power." Fol. 294: "The main results which have been attained in the exploration of the high gravel deposits of the Sierra Nevada are these: That these detrital masses are the work of rivers which are of Tertiary age, as will be more fully set forth," etc. Fol. 295: "Again, it is perfectly clear that the shaping of the surface of the bedrock and all the erosion which has taken place since the beginning of the gravel epoch have been exclusively the work of water." * * * It can be set down, however, as established beyond any possibility of doubt, that ice had nothing to do with any part of the erosion of the gravel period."

These extracts are given to show that I am not ignorant of the opinion of Prof. Whitney, which, however, does not prevent me from adhering to my own, the result of long study of

the subject, the localities and the auriferous deposits in detail.

Arguments Against the Ancient-River Theory.

Dr. J. B. Traak, the first State Geologist of California, was the first to advance the ancient or dead-river theory, although, like all other writers on the subject whose works I have consulted, he soon found reason to doubt it.

In his "Report on the Geology of the Coast Mountains, Assembly Document No. 9, 1854," on folio 62, may be found the following: "From the examinations that were made on this range there are abundant evidences that an ancient stream flowed through this section of the country and in a parallel direction with its then existing mountain ridges, and the extensive mining operations conducted in the southeast part of Sierra county on this range have been the means of demonstrating this fact."

On folio 64 he calls attention to certain facts strangely at variance with this theory, as follows: "The organic matters deposited are perfect in their forms, the most delicate parts of leaves are truthfully preserved to nature, the material in which they are imbedded is that usually found suspended in waters that were but slightly disturbed, and when disintegrated, yields an almost impalpable powder. Not a pebble nor even coarse sand is to be found in any part of it. In fact, every feature that would indicate a quiet state of waters is fulfilled in the section under consideration."

Folio 61, he traces the placer deposit 70 miles and assumes it to be four miles wide. This report was written in 1853, and presented to the Legislature early in 1854.

William P. Blake, 1854, visited the mines at Mokelumne Hill and the mining region near Georgetown, and wrote as follows ("Geological Report, Explorations and Surveys from the Mississippi River to the Pacific Ocean, Pacific Railroad Reports," Vol. 5, fol. 273): "It would appear from this section that there was an alternation of quiet and running waters. The deposition of the clay and pumice was interrupted by a swift current bringing gravel and gold, and this current was probably similar to that which first spread the gold on the uneven surface of the alluvium. It is probable, also, that the current was sudden and powerful, for if it had flowed for a long time, the clay would have been swept away before the gravel was laid down. The gravel must have accompanied the flood, and this acted as a barrier to the denudation of the layer of clay below." Fol. 277: "The river drift containing gold appears under a variety of forms. It may be either coarse or fine, but is found in all ages from the accumulations now forming in the beds of streams and on bars to the deposits of rivers which formerly flowed over the surface 2500 feet higher than now. The courses of such ancient streams are discovered by the miners and followed by them in their underground explorations. All the peculiarities which the beds of rivers present, the water-worn surfaces, pot-holes and some scale gold are found in them."

Since I commenced the preparation of this paper, I became aware of the fact that Prof. Newberry, as early as 1857, was of the opinion that the auriferous beds of California lay in ice channels. (Annual of Scientific Discovery, 1857, fol. 327.)

These authors were followed by others, and the theory was assumed rather than proven. The following are among the numerous persons who have written on this subject:

Charles S. Capp, Letters to the San Francisco Bulletin.

J. D. Whitney, Geological Survey of California, 1861-1864.

James Hector, M. D., Quarterly Journal of the Geological Society of London, Vol. XVII, 1861.

P. Laur, Report on the Production of the Precious Metals in California to Minister of Public Works, Paris, 1862.

Titus Fey Cronise, Natural Wealth of California, San Francisco, 1858.

J. S. Hittell, *Overland Monthly*, Vol. 1, San Francisco, 1868.

J. S. Hittell, Resources of California, San Francisco, 1879.

Joseph LeConte, On the old river beds of California; *American Journal of Science*, Third Series, Vol. XIX, 1880.

J. D. Whitney, Auriferous Gravels of the Sierra Nevada of California, Cambridge, Mass., 1880.

Andrew Larsen, MINING AND SCIENTIFIC PRESS, Vol. XLII; reprinted in Production of Gold and Silver in the United States, Burchard, Washington, 1880.

C. J. Brown, MINING AND SCIENTIFIC PRESS, Vol. XXXI.

James J. McGillivray, MINING AND SCIENTIFIC PRESS, Vol. XLII.

R. Chisholm, Natural System of Volcanic Rocks; Memoir California Academy of Sciences, San Francisco, 1868.

W. A. Goodyear, Paper read before the California Academy of Sciences, and published in the *Evening Bulletin*, San Francisco, Vol. XLVIII, No. 140.

C. J. Brown, Mineral Resources of West of the Rocky Mountains; Raymond, Washington, 1877.

Henry DeGroot, Second Annual Report State Mineralogist of California, Sacramento, 1882, Appendix, fol. 134.

An article on the origin of ancient rivers, by "Old Sierra," appeared in the MINING AND SCIENTIFIC PRESS, Vol. 19, August, 1869, fol. 130. After describing the different varieties of gravel deposits, the writer thus continues: "These two kinds of cement conglomerates cover a vast portion of Central Plumas county and parts of Sierra and Placer counties, and present unmistakable evidences of the bed of a great lake, or chain of lakes, forming the west-

ern border of a chain of volcanic basins to the east, the source of the old river channels."

John S. Hittell (*Overland Monthly*, Vol. 1, 1869,) contributes an able article on the dead rivers of California, in which he advances, as far as known at that day, all the arguments in favor of the old river theory; but while the reader is referred to the paper for much valuable and interesting information on the subject, I am constrained to disagree with Mr. Hittell and call attention to certain incongruities in the paper referred to. Admitting his facts to be indisputable and his descriptions admirable, it is only his conclusions to which I take exception.

He states what is understood by a dead river, shows that at the time of writing they had produced \$300,000,000 in gold and were yielding at the rate of \$8,000,000 annually; that the blue lead could be traced 65 miles and must have flowed many hundreds of miles; the elevation of this channel was 5000 feet at the highest point, 2800 feet at the lowest, a grade equal to 33 feet to the mile. After asking the question, "Whence comes all the quartz of the blue lead?" he replies: "It came from the far North. The immense size of the boulders implies a mighty current; these in the lowest stratum average in some places a ton, and many are found of 20 tons; they are not found here and there, scattered as though they had tumbled down from the banks of the river near where they were found, but they are evenly distributed in a stratum of equal thickness across the whole bed and for miles in length."

Dr. Henry DeGroot, a fine writer, close observer and firm advocate of the old-river theory, contributed an appendix to the Second Annual Report of the State Mineralogist of California, 1882. After accurately describing the channels which he asserts were old river-beds, like other authors on this subject, he proceeds to call his own conclusions in question in a number of instances. On fol. 144 he writes: "Viewed as a whole, this old river system with its short main trunk, its long branches and their ramifications, presented much the appearance of a wide-spread oak." * * * "The most of these departed rivers were, in fact, exceedingly crooked—so much so that their numerous and violent sinuities, by creating the appearance of parallel channels in close proximity to each other, have led some observers into the mistake of unduly multiplying their number. At several points along them this feature becomes strikingly apparent. How devious must have been the course of the main south trunk along that portion of its route reaching from Gold Run to Quaker Hill, is disclosed by the fact that it ran, or is supposed to have run, through all the leading mining camps between those two places. As its passage through these several localities would render the course of this great south artery a perfect plication, there is warrant, perhaps, for assuming that there occurred at this point a network of these ancient channels, a number of them having come in from various directions and centered here, this being more reasonable than to suppose that the main trunk pursued a course so exceedingly tortuous. Elsewhere this stream, as laid down on the map referred to, would have appeared to have followed a course equally capricious, running within a linear stretch of a few miles toward almost every point of the compass."

When the Second Annual Report of the State Mineralogist was published, 1882, I accepted the popular theory under protest, although certain discordant facts had even then been discovered, as the following quotations will show:

Fol. 95: "This interesting subject is mentioned here in this general way to show that the gold in our gravels is derived from the bedrocks and probably not from outside sources. The quartz veins in metamorphic rocks, called in California 'bedrocks,' were broken and worn by the erosive force of the ancient rivers, by glaciers, and by forces lately noticed and yet to be mentioned. The smaller fragments were crushed to sand, while the larger became the quartz boulders so common in the hydraulic mines. In this disintegration process, gold in quartz veins was set free, while other metals, as lead, iron, copper and zinc, yielding to the action of the elements, changed to compounds and were lost to view. Ice very probably had much to do with the disintegration of the rocks in ancient times. Some phenomena have been observed which can in no other way be explained."

Fol. 96: "I have reason to believe that we have been generally mistaken as to the genesis of the auriferous gravels in the beds of ancient rivers; for river-beds they are, without a reasonable doubt. But the theory that these immense bodies of gravel were deposited by a great flood, by a series of floods, by long deposition or by the rivers themselves, does not account for the gold in them. The microscope seems to show that they are not river sand at all and have never been far removed from the place that gave them birth. I have examined samples from many localities, including some of the most noted hydraulic mines in the State, and the result is invariably the same. The sand grains are all sharp and angular, and not at all worn as are those from the seashore, the great Colorado desert, the agricultural soils, and the beds of the present rivers. To verify these results, I pulverized quartz on an iron slab to different degrees of fineness and examined it under the microscope, finding it identical with the sands from the gravels of the gold placers."

Fol. 98: "No observant person can study these sands under the microscope without feeling that he is looking at the ruins of the rocks. There can be no doubt that each little grain owes its condition to some powerful cause which has acted on larger rock fragments or formation with sudden force, and that the sands are not the result of slow disinte-

(Continued on page 237.)

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador Ledger, March 29: Contract work at the Lincoln mine is finished, and the men now at work taking out ore. The mill was started last week and Mr. Stewart feels confident of being able to keep it running steadily all the summer. W. E. Darrow of New York Ranch and J. Bawden of this town have charge of the mill, and whatever gold there is in the rock they will be apt to get. Drifting at the North Star is still in progress, with nothing new to report. Unless something is encountered shortly, sinking will again be resorted to.

COSMOPOLITAN.—Amador Ledger, March 29: The ore crushed from this mine so far has not come up to expectations. Indeed it has fallen considerably below paying expenses. What the exact yield per ton has been we are unable to say, but the fact that the mill has been brought to a standstill, after running long enough to test the quality of the quartz at present in sight, is sufficient proof that it fell short of the paying standard. The owners, however, are determined to do considerable prospecting. They have a long stretch—two full claims—along the mother lode, and in this territory there is no reason why they should not encounter good pay ore. A drift is now being run north to tap a large ledge, the croppings of which show very strongly on the north side of Dry creek. The distance to be run is several hundred feet, and it will take some months to reach the desired point.

LOYAL LEAD.—Active work has been resumed on this mine, situated in the Black Hills country, near the Gover. This week G. R. Breese sold the greater part of his interest in the property, retaining half a share, or one-fortieth interest. The mill is to be put in running order and started up as soon as possible.

REEVES.—This mine is owned by the five principal stockholders of the South Cosmopolitan Co. The 20-stamp mill is running steadily. No regular cleanup has been made as yet, but from the amount of gold obtained from the plates, the owners are sanguine that they have struck a good thing. The claim is located about a mile north of the Cosmopolitan.

MISCELLANEOUS.—Another cleanup has been made at the McKenzie Bros.' mine at Irishtown, which turned out as satisfactory as the last. It is pleasing to be able to report a paying mine in operation in this district. It is a region where Nature has scattered large quartz deposits, and the fact of one paying property in activity will encourage other mine-owners in the locality to start their claims. It is confidently believed that a fair amount of prospecting would result in a number of good mines being opened in this vicinity. The McKenzie claim was closed for a few days this week, waiting the arrival of some castings for the mill from San Francisco. The Kennedy, we are pleased to state, is looking better than at any time since the present company took hold of it. The ledge at the lowest levels is turning out some fine rock, keeping the 40-stamp mill in steady operation. Altogether the prospects of the mine have greatly improved by the last sinking.

Calaveras.

MURPHYS.—Cor. Calaveras Prospect, March 29: Preparatory arrangements are seen at all points of the compass, in this district, for an active season in mining matters the coming summer. Considerable prospecting is being done now that the weather has become more settled, and we look for better and more prosperous times to succeed the extraordinary dull spell just passed through. At the Norfolk mine an increased number of miners have been put to work in the underground works, and the compressor is kept in constant motion. The Total Wreck Co. has its mill ready for crushing, and it will soon be in motion. Much is expected from this mine, as a number of tons worked in the Oro Plata mill has given a high average. Mr. Campbell of San Francisco, the owner, is expected here soon, to be present at the starting up of the mill. He is highly elated with his purchase. The Morse gravel mine on Central Hill, once so famous for its enormous yield of gold, is in full operation, and a vigorous prosecution of work is the order now since the advent of good weather. At the adjoining mine of Wm. Thomas & Co., where the recent fatal accident occurred, causing the death of R. Roberts, they are busily engaged with the surface diggings on their immense gravel claim. The different mines in the Stanislaus region are now inert; one vast sheet of snow still blankets that whole district. When the snow shall have disappeared, a party is expected up from below to take hold of the property.

Inyo.

CERRO GORDO.—Inyo Index, March 26: A correspondent sends the following items of interest from Cerro Gordo: Generally dull at present. A few mines are prospecting in the Union at the 400 and 700 levels. John Thomas and Wm. Crapo both have good prospects. Thomas has sunk 40 feet and has taken out a few tons of high-grade lead ore. Crapo is working on his prospect, about 300 feet south of the Union, which has every indication of a large body of ore.

ANTIMONY.—There is probably no place on earth where antimony so abounds as in the region bordering Death valley. The section referred to embraces southern Esmeralda, eastern and southeastern Inyo and northern San Bernardino counties. Near Panamint in this county, which is about the center of this great mineral belt, antimony predominates. A prospector who made a recent location there, in Wild Rose district we believe, informs us that the surface of his claim is covered with immense howlers of antimony that assay 60 to 80 per cent in that metal, and that thousands of tons of it lie there exposed, requiring only to be broken and sacked and a means of transportation. In fact, the latter necessity has been the one drawback to the development of that great mineral region. Perhaps the sudden appreciation in the value of antimony may result in turning the attention of capital in this direction. Only a few weeks ago some parties from Los Angeles bonded a number of antimony locations in the Death valley section, said to be in the interest of an Eastern or European syndicate.

Nearly all ores found in this county carry more or less of antimony.

MINING PROSPECTS.—Andy Fyffe, superintendent of the Kinkadee M. Co., says it is the intention of the company to ship in machinery as soon as the new wagon-road is completed. They will put up an 80-ton water-jacket furnace. We are under obligations to Jas. C. Crocker for mining news from that section of the country. Mr. Crocker has all through the mines. They had sunk a new shaft 80 feet deep, in ore all the way which averages \$45 per ton in silver and 64 per cent in lead. The red oxide iron ore goes \$81.80 per ton in gold. The ledge has been traced for 15 miles, cropping out most of that distance. They have an abundance of wood and water near the mines. Mr. Fyffe says he can furnish charcoal at eight cents per bushel by putting up large ovens. There are a great many prospectors at work in that district already. We also learn that there have been several other properties there bonded to San Francisco parties during the past week. Mr. Fyffe told Mr. Crocker he thought there would be 500 men at work in that district before next fall. Sam Piper has made a very rich discovery in this county, about 10 miles northeast of Gilbert's ranch, near his old arastra. He has two men at work and has run a drift in on the ledge about 40 feet. The ledge is 30 inches wide and assays \$70 per ton in gold. So Inyo county is coming to the front once more, and will receive a benefit also on completion of the road to Esmeralda county, Nevada, which has yielded up her millions and has billions left for honest toil.

SALINE VALLEY BORAX DEPOSITS.—Cor. Independent, March 28: The borax deposits in Saline valley extend over a portion of four townships. The principal portion of the borax deposit is in the northwest part of township No. 14 S. R. 38 E. The marsh portion of the valley has an area of from 25 to 30 square miles. The best portion of the deposit is at the southwest border of the valley and has an area of two to three square miles. This is the lowest point in the valley, the altitude being about 1100 feet. The borax belt and a soda belt cross each other at this portion of the valley, forming the combination known as borate of soda. The course of these belts, as near as I can determine, is: soda, north, 20° east; borax, north 20° west. The deposits of borate of soda found on the west side of the marsh are heavy and rich, but not regularly distributed over the surface. This indicates that the deposits have been formed by water running in a number of channels, or "washes," from the northeast to the southwest side. The deposit on the east side of the marsh extends for a distance of four to five miles in a northwesterly and southeasterly direction and is rich in borax and very evenly distributed. When the borax found on the surface is removed, another deposit speedily forms which seems, judging from ordinary tests, to be as rich as the original deposits. At the northeast edge of the marsh there rises out of the bedrock a number of springs, the water of which is strongly impregnated with boracic acid. The water from all these springs quickly sinks into the marsh, the flow being strongest from October till April of each year. The belts of borax and soda already spoken of, in their course southerly are far separated at the extreme south side of the valley, and on that side of the marsh is found a deposit of borate of lime, more commonly called "cotton-ball." The supply of wood and water in the valley is abundant. In my judgment there is not a place in the United States where borax can be got at so small a cost as in Saline valley. Messrs. Conn & Trudo have made a fairly good road from their works in Saline valley to Alvord station on the C. & C. railroad. The length of the road is 45 miles.

Mariposa.

THE WHITLOCK MINES.—Mariposa News, March 29: The season opens with bright prospects in the quartz-mining industry over in the Whitlock mining district. Ellingham & Grove have purchased the 5-stamp mill formerly owned and operated by Dr. Robinson on Sherlock's creek, between White's Flat and the old camp, and will remove it to a convenient point on Whitlock's creek, at the site occupied by the little prospecting mill. They have about 1000 tons of milling ore on hand ready for crushing. Heisser & Peregov have a splendid prospect in their claim near Ike Lyon's place. They sunk a shaft 50 feet in depth and run a cross-cut developing a vein of about 9 feet in thickness, showing free gold as well as rich sulphurets, and are now crushing the ore at the prospecting-mill of Ellingham & Grove. In the opinion of men who have good judgment, based on experience in mining and milling, the ore now being crushed will yield about \$20 a ton in free gold. If there has been no mistake made in the assays of concentrated sulphurets and in figuring the estimates of the percentage contained in the ore body, the gross yield per ton will aggregate something over \$100. Mr. Grove thinks this mine is going to develop a bonanza. N. J. Farrens is at work on the Bull Dog vein which showed up in good form last year. From a crushing of five tons of quartz a little over \$55 was obtained. Since the above was in type, Messrs. Peregov and Heisser came in from Whitlock's and reported the result of their cleanup. They crushed 17 tons of quartz which yielded, in free gold, 18 ounces and \$10, which is within a fraction of the previous estimate of \$20 per ton. They estimate the sulphurets to amount to one per cent of the ore body. Sample assays show a yield of \$11,000 to the ton of concentrated sulphurets. They have from 300 to 400 pounds as the result of their late work and will ship them below for a practical test. In crosscutting the vein they ran 7½ feet and were not through it when the winter storms drove them out. The body of sulphurets ore was five feet in thickness. Everything confirms the truth of the statement, based on estimates made by practical miners and a personal knowledge of that district, that this is a mine and Whitlock's will soon come to the front as a lively mining camp.

DILTZ MINE.—Cor. Mariposa Gazette, March 29: It is a long time since anything has been reported from the mines over here, and there is not much now that is interesting. I have had more water than I needed or wanted, overflowing ditches and causing huge landslides from the hanging-wall of the mine, and covering over the two best timbered and deepest shafts, where I made the most gold and have the best quartz. I have spent considerable time sluicing on the north side of the hill uncovering a fine vein. The worst thing to contend with is a heavy bank of pipe clay, which crosses the vein and

will carry away all the gold that will stick to it. I have now uncovered 100 feet of a splendid vein, a continuation of the "big nugget" vein, and if the water holds out, soon will have 200 feet of the hanging-wall uncovered.

Nevada.

MINING OPERATIONS TO BE COMMENCED.—Grass Valley Union, March 29: The Ben Franklin mining property, situated on the Osborne Hill range and near the lower Colfax road, which was recently bonded to a Chicago company, will have work started up at an early day, the only delay being caused by the bad condition of the roads, which proves a drawback to the hauling of the necessary machinery; but when the roads are sufficiently dried up the work of putting up steam-boasting and pumping works will be commenced and pushed. The Ben Franklin is an old location, one among the first made in the district, and at the time that locations were made in square claims. The claim originally made on the Ben Franklin was worked down to the boundary lines and the present company owns the ground below on the dips and angles. The mine has yielded fine ore and there is a large extent of virgin ground yet to be worked. The Chicago company, which is understood to be a strong one, has paid a portion of the purchase price of the property, which was one of the conditions of the bond. Besides the Ben Franklin, the Lafayette mine, in the same vicinity, is soon to be started up under the auspices of a San Francisco company. This claim is on the western slope of Osborne hill, and above and parallel to the Alaska mine. New machinery will be put up as soon as the weather conditions are considered favorable. The St. Johns or Knights of Malta mine is also to be started up with the least possible delay by a local company, although some of the stock has been taken by San Francisco parties. Steam-boasting works will be put on the new shaft, which is a short distance from the old shaft. The ledge in this mine is very strong and carries a very rich pay streak. With the above and the starting up of the Gold Hill, Menlo, Brunswick, and the regular work of the old and new mines now operating, the present year is bound to be one of unusual activity in quartz mining in this district.

Placer.

QUARTZ NEAR AUBURN.—Placer Herald, March 29: The Moore quartz mine, located about a mile and a half west of Auburn, and owned by T. M. Thorpe, J. W. White and Walter White, is one of the richest ledges that has ever been uncovered in this part of the State. When the present owners commenced work on the lead they found a shaft about 40 feet deep, which had been sunk years ago by some Frenchmen, and from which rumor said they had taken out considerable money. Why the Frenchmen abandoned it is a mystery, for when Mr. Thorpe and the White boys cleaned out the shaft they found rock in the bottom which showed liberally in free gold. They began at once to go down on the ledge, and are now at a depth of 150 feet from the surface, and in sinking the 110 feet they have taken out of the shaft alone, \$18,000. The three owners have thus far done their own work. They take it moderately, and yet realize handsome pay for their time. The rock from as much of the shaft as they sunk last summer, yielded them about \$10,000. How deep the pay chute is they have no idea, but they do know that in the very bottom of their present works the rock is fairly blocked with gold. The ledge on the surface prospects rich for 150 feet that they know of, which is an indication of the amount of money they will take out as soon as they get ready for drifting and stoping. Heretofore they have hoisted the water and rock with a bucket and whim, but to facilitate their work they have just put in place a ten-horse power engine for pumping and hoisting, and a trial of it proved very satisfactory. The ore is fabulously rich, and has been so from the surface, the only variation being its gradual improvement as they go deeper. The width of the pay chute as indicated from the surface, and its yet indefinite depth, point to the existence of a mine of inestimable value, and one which in some remote and almost inaccessible country would attract to its neighborhood thousands of miners and millions of capital. Quite a number of the quartz mines in this part of the country are getting down to a steady and reliable basis, and altogether the outlook for quartz mining in the Auburn and Ophir districts was never more encouraging than at present.

OPHIR MINES.—Argus, March 29: Mr. Hartley has 22 men employed at the Almont mine. The Huntington mill is kept running on good ore, while development work in the mine is being vigorously prosecuted. There is no extravagance visible in the equipment of this mine, and we consider that Mr. Hartley has so far shown good judgment and managed the mine very successfully. An upright hoiler and engine is used for pumping. The mill is equipped with a rock-breaker, a Huntington mill with self-feeders, and two Woodbury concentrators, all of which are run by water-power. A drift will be run several hundred feet on the ledge from the main shaft, which will no doubt open up a large amount of ore. Mr. Hartley is also working the St. Lawrence mine, owned by Chas. Reed. The upper tunnel is now in about 500 feet, and is still being driven ahead on very good ore. An upraise has been started on the ledge, about 300 feet from the tunnel; in this upraise the ledge is over two feet thick, and already there is a large amount of ore in sight. The ledge is well defined, and is evidently a true fissure vein. The ore from this mine is being crushed at the Pelster mill. A lower tunnel is being driven to tap the ledge at a greater depth, and we believe the developments will warrant the erection of a mill on the mine in the near future. The new mill at the Eclipse mine is nearly completed, and will be one of the best arranged mills in the county. We did not inspect the underground workings of the mine, but understand that the ledge is increasing in size, and the ore now on the dump and in the mill certainly looks very flattering. Our time was too short to visit all the mines about Ophir, but we understood that the Hathaway was running with a full force and paying well. Preparations are also being made to begin work on the Gold Blossom, and it seems to be the general opinion that the St. Patrick, the Crater, and several other mines will be in operation before the summer passes. One thing noticeable about the mines about Ophir is, that the Pelton wheel is used exclusively, which is proof that it is giving general satisfaction. With the renewed activity in mining and the prospect of a lively campaign, Ophir bids fair to be one of the liveliest camps

in the county, and will no doubt receive many visits from our politicians. T. M. Tharp and White Bros. have just put up a new upright hoiler and engine on the Moore mine for pumping and hoisting. Their new steam pump is in place, and they expect to begin pumping the water from the shaft in about two weeks. At present they are working on the lead about 300 feet east of the shaft, and are getting some very rich rock at this point.

San Diego.

SHACKLES BASIN PLACERS.—Cor. San Diego Sun, March 26: A close inspection of the contemplated course of the Mount Tecate flume develops the fact that the anticipated difficulties are not near so enormous as was predicted. The course has a very even grade, and I say unhesitatingly, that the enterprise can be effected without encroaching upon one foot of Mexican territory. The Mount Tecate M. Co. is a new organization on old-worked ground, which is situated in close proximity to the Cottonwood river, and was worked some 12 years ago by Mexicans, some of whom were very fortunate in getting quite a wad of gold; the process of obtaining it being dry washing. This way appeared to be an up-hill business, and the placers were abandoned until very recently, when a Mr. Hanson of Arizona gave the old camp a new stimulus. The placers are quite good, and all the gulches, ravines and canyons are possessed of more or less gold, and not so much less either. Water is the cry, but this will be supplied from the Mount Tecate flume, which will run close enough to the diggings to supply all wants. Your readers can form an opinion as to the richness of these diggings. The following I personally vouch for: Messrs. Johnson & McLean, in running a small cut, obtained, where they little supposed gold existed, nearly two ounces of as fine gold as I ever saw. This statement is the bedrock truth, as I had the gold in my hand. Some of the other gulches are even richer. Mr. Hanson's discovery constitutes one of the largest gold-bearing ledges on the coast. It can be traced for several miles. The developments are of such a meager sort that I am unable to arrive at any conclusion, but am satisfied that free gold has been seen in some of the pieces of quartz. In conclusion, I have the authority for stating that a force of men will commence sinking immediately.

NO CONTRACT LET.—Julian Sentinel, March 21: The statement made in these columns last week, concerning the letting of the contract for repairing the old shaft of the Helvetia mine, was made on the authority of Mr. Hubbell. It has since turned out that the contract was not signed at the time, and some minor details could not be arranged to suit all parties, so the contract was not let to any one.

JULIAN.—We were shown a letter this week from the manager of the Julian G. M. & M. Co. of St. Louis, which contained very encouraging news. The parties who will start the ball rolling will leave St. Louis the 1st of April, and promise to surprise the people of this district in the thorough manner in which they intend to prosecute the work.

Shasta.

OLD DIGGINGS DISTRICT.—Redding Free Press, March 29: The mill at the Reid mines was started up last week. Mr. F. P. Satterlee, of Shasta, has charge of the mill. Several more men have been put to work in the mine. Mr. Sherard says the mine is looking fine and he is getting confident in this side of the river. Mr. Rippetto, superintendent of the Walker brothers' mines, has returned from Salt Lake City and started up the mill Thursday morning. It was a welcome sound to hear the whistle once more. This makes mill number three running thus far. The usual force has also been put to work in the mine and a contract let to run a tunnel. An important chimney of ore has been developed lately in this mine and it is looking better than ever.

BEECHER.—Shasta Courier, March 29: In the Beecher mine at the Gage place two and one-half miles from town, the workmen in the long tunnel struck the ledge on which a shaft was sunk some depth last year. The ledge is three feet in width and prospects very satisfactorily, and all the indications are that Beecher is the owner of a good mine.

IGO.—H. C. Reno has disposed of his interest of the Chicago and Crystal mines lease to H. S. Hill, of Elk Grove, and T. R. Ryan, of Red Bluff, who will start up the mine as soon as the weather will permit. They have a large body of ore on the dump now ready for shipment. Robinson & Carr are doing considerable work on the Black Prince mine, running tunnels and crosscuts. The arastras on South Fork are all running on average ore. Doc. Dunham is putting good work on his Muletown ledge and says he will be a rich man yet.

NEVADA.

Washoe District.

ALTA.—Virginia Enterprise, March 22: Drifting southeast on the 1010 level from the bottom of the winze; face in low-grade quartz. Crushing 45 tons of ore daily of the average value of \$20 a ton.

CROWN POINT.—The 160 raise is up 31 feet and a north drift started from it to connect with the Kentuck for air. Are sinking below the south drift track to connect with the 350 stope. The bottom is in fair-grade ore. Shipped to the mill during the week 869 tons of ore, the average battery samples of which were \$17.85 per ton.

BELCHER.—The 200 level, south drift from west crosscut is out 90 feet, having advanced 36 feet during the week. The face is in low-grade quartz. Have started a west crosscut from the shaft station on the 300 level which is out 35 feet.

CONFIDENCE AND CHALLENGE CON.—West crosscut No. 1 from the 800 level north drift is out 46 feet, having been advanced 32 feet during the week. The face shows porphyry.

OVERMAN.—From the 1200 level have extracted and hoisted 264 tons of ore. Shipped to Vivian mill 238 tons of ore. Battery average \$19.68 per ton, of which \$9.68 is gold. On the 1200 level the north-west drift from the northeast drift has been extended 13 feet through hard quartz, giving fair assays.

CONFIDENCE-CHALLENGE.—West crosscut N. 10 from the 800 level north drift is out 46 feet, having advanced 32 feet during the week. The face is in porphyry.

CON. IMPERIAL.—West crosscut No. 1 from the north drift, 750 level, is in 266 feet, having advanced 14 feet; face in a mixture of quartz and porphyry. West crosscut No. 2 from the same drift is out 177

feet, 37 feet having been made during the week. The face is in porphyry. North lateral drift on the same level is in 70 feet, having advanced 27 feet during the week; the face shows quartz giving low assays.

JUSTICE.—The 622 level north drift advanced 7 feet during the week; total length, 758 feet. The face shows three feet in width of low-grade ore. The southwest drift on the 490 level advanced five feet; total length 540 feet. The face is in hard rock. The mine was shut down five days during the week on account of lack of water. Shipped to the mill 72 tons of ore. Average battery assay, \$21.48 per ton.

YELLOW JACKET.—Shipping about 65 tons of ore daily of the average value as per battery samples of \$22 a ton to the Brunswick mill.

SEG, BELCHER.—The southeast drift from the B-lcher crosscut is in 61 feet; the hanging-wall is exposed in the east side of the drift; the face and west side are in quartz, assaying from \$8 to \$15 per ton. The joint 850 level east crosscut is out a total distance of 272 feet and the face is in porphyry and clay.

POTOSI.—The east crosscut, 300 feet south of north line, 850 level, is out 90 feet; face in porphyry. The east crosscut 400 feet south of north line, 850 level, is out 127 feet; face in porphyry, with seams of quartz giving fair assays. The winze from the 930 level, 400 feet south of Chollar shaft, is down 18 feet; the bottom is in streaks of quartz giving good assays. The raise from the 930 level is up 69 feet; the face is in ore the car samples of which run from \$50 to \$70 a ton.

CHOLLAR.—The east crosscut, 80 feet south of north line, 750 level, is out 70 feet; face in quartz giving fair assays.

EAST BEST & BELCHER AND NORTH GOULD & CURRY.—In the west drift of the East Best & Belcher they struck ore that looks very favorable. The improvement in the ore the past week is very encouraging.

SAVAGE.—On the 500 level the upraise from the intermediate drift is advanced 40 feet. The top of the raise is in ore. Are extracting ore from the 400, 500 and 600 levels, and from the old stopes on the 750 level. Shipped to the mill during the week 455 tons of ore the average battery assays of which were \$20 per ton. Bullion on hand \$22,350.25.

HALE & NORCROSS.—On the 300 level they have retimbered the north drift and connected the same with the Savage upraise from the 400 level. In No. 1 west crosscut they have laid a track and put in air pipes preparatory to resuming work in the face of the drift. On the 1250 level they have started a winze in ore to connect with the southeast drift on the 1300 level. Owing to breaks in the water flume which supplies the Nevada mill, very little ore was milled during the week, and only about one-third of the regular force of miners was at work.

Cherry Creek District.

ON LEASE.—White Pine News, March 29: A local company has been formed in Cherry Creek to work the Eschequer mine on lease. The company is made up of resident miners and millmen, and as it is said there is considerable fair ore in the mine, it ought to be made a success.

Columbus District.

CANDELARIA.—Walker Lake Bulletin, March 23: Col. W. J. Sutherland, D. H. Jackson and Governor Kinkadee passed through to Candelaria last Saturday night. Mr. Jackson is the newly appointed superintendent of the Holmes property, and we are informed that Governor Kinkadee will act as the resident secretary. On the arrival of the train at Candelaria, hoofbeats were built and a glowing reception tendered the new-comers. Active operations are already begun at the mine, and it is believed a large force will soon be put on. The mill at Belleville is undergoing repairs, preparatory to being put to work on ore. There is a bright ray of sunshine hovering over our sister city, and Hawthorne rejoices thereat. Col. Sutherland is the general manager of the property, and it is due to his indefatigable energy that Candelaria emerges from the slough of despond into which she has lately fallen.

Silver King District.

SILVER AND LEAD.—Pioche Record, March 29: Silver King district is about 16 miles northerly from Bristol, or about 40 miles northerly from Pioche, and is reached by a good wagon-road. The formation is lime and porphyry, the principal deposits being at contacts. The leads named below run easterly and westerly—a little south of east and north of west, and may be easily traced on the surface. They pitch south at angles varying from 45 to 80 degrees. About \$30,000 has been realized from ore shipments to Ward, Bristol, Dry Valley and other points during past years, the shipments being made at great disadvantage, on account of excessive transportation charges, and (in those times) excessive charges for working. The ore is a free carbonate of lead, with oxide of iron in a lime gangue. Sixty-nine assays, being all the tests made in prospecting by two men, from April to October of last year, averaged 38 ounces silver per ton and 25 per cent lead. Of such ore about 300 tons are now on the dumps and probably as much more in sight in the mines. Of the Wheatly Bros. claims to which the above refers, the Ida has been prospected to a depth of but 75 feet, the Highbridge 75 feet, the Schiller something over 100 feet, the Caesar 100 feet, practically in mining parlance, mere surface work. Yet their record and present showing is good, to say the least. Other mines in the district which promise well are owned by Messrs. Geo. Jones of Bristol, C. J. Boskowitz of San Francisco, D. C. McCarter of Pioche and John F. Cupid of Ely, White Pine county.

Tuscarora District.

BELLE ISLE.—Times-Review, March 28: The 250-foot level crosscut extended 20 feet; crosscut from north gangway, 350-foot level, extended 14 feet.

NEVADA QUEEN.—North gangway, 600-foot level of North Belle Isle, extended 26 feet. The flow of water continues about the same.

NAVAJO.—South drift from the winze, 150-foot level, extended 4 feet. East crosscut from the end of south drift west, same level, extended 6 feet, cutting seams of chloride ore. South drift from No. 1 crosscut, 350-foot level, extended 11 feet.

GRAND PRIZE.—Face of east drift from the north crosscut, 500 level, advanced 6 feet and looking better.

NORTH BELLE ISLE.—South drift from station crosscut, 300-foot level, extended 16 feet and sus-

peeded, and a drift started north from same crosscut. **DRI. MONTE.**—1st level: North gangway has been extended 20 feet; seams of good ore show in drift. East crosscut from north drift has exposed 2 feet of good ore, some of which assays \$192.18 per ton. 3d level: East crosscut from the north drift, on the line of North Commonwealth, extended 15 feet, showing fine ore in the face, assays as high as \$2400 per ton being obtained.

NORTH COMMONWEALTH.—1st level: Have started No. 2 east crosscut from south gangway to develop ground south of No. 1 crosscut where ore is opened up. Upraise from No. 2 north drift extended up 11 feet in vein, but nothing of value. South drift from joint crosscut advanced to feet; the ore is not so high grade as heretofore. East crosscut from north drift from same point is penetrating ore, some of which is high grade; assay to-day \$492.18 per ton.

COMMONWEALTH.—1st level: East drift from north drift extended 11 feet. The ore is better grade than heretofore. East line crosscut from north gangway advanced 20 feet through vein matter. 2d level: No. 2 east crosscut extended 8 feet, cutting seams of spar, and is looking favorable for ore. 4th level: East crosscut from north gangway extended 13 feet through porphyry. South crosscut from south gangway has been run 11 feet, cutting some high-grade ore. West crosscut from same point extended 6 feet, showing low-grade ore. The extraction of ore has been suspended for the present and the mill is being cleaned up. Ship to-day \$15,000; total for the week, \$31,000. Concentrator is running right along. Crushed 476 tons, assay \$17.85 per ton.

ARIZONA.

QUEEN BEE.—Mohave Miner March 29, C. H. Park, superintendent of the Queen Bee M. Co., has made a contract with Joseph Prisk to sink the upper shaft 125 feet deeper and to run a drift along the ledge 135 feet, the contract to be completed in 120 days.

SILVER KING.—N. C. Amer is awaiting the arrival of some new steam-boasting machinery which he intends putting up on the Silver King. There is too much water to handle for the whim, and a steam hoist is imperative for the economical working of the mine.

TODD BASIN.—W. G. Campbell has obtained a hood on the Oro Plata and Mariposa mines in Todd Basin, and he will in a few weeks put up a plant to work the ore from these mines. The work of leveling the ground for the placing of the machinery will be begun next week.

BLACK HAWK.—Geo. M. Bowers, the superintendent of the Black Hawk mine, spent several days in Kingmao this week, and reports the mine in good shape, and looking as well as ever. A new creek has been made in one of the upper levels, but the extent is unknown.

C. O. D.—Manager M. D. Howell has closed down the C. O. D. mine for the present. There is too much water for the present hoisting machinery to handle. When operations are again resumed the mine will be sunk 100 feet deeper, and a good deal of prospect work done.

IVANPAH.—Mr. Lawrence of Ivanpah was in Kingmao this week with a lot of high-grade ore from that district, which he had worked at the Kingmao Sampling Works. He reports but little doing in that camp, as but few of the mines are being worked on account of the great cost of getting the ore to the railroad.

GRAND CANYON.—Journal-Miner, March 26: John Marshall, one of the discoverers of mineral to the Grand Canyon, was in Prescott on Saturday, getting assays made from the new find. He says that they discovered ten well-defined leads, from each of which they secured rich specimens of ore. The Colorado river at that point does not exceed 200 feet in width, and the ledges could be plainly seen on the opposite side of the river. Mr. Ashurst and himself made a raft and attempted to cross the river, and had a narrow escape from drowning, when they were compelled to abandon it. In addition to the discoveries of ore made, Mr. Marshall says they found a deposit of very pure salt. Several prospecting parties have already gone into the canyon from Flagstaff, and he thinks there is a good prospect for a lively camp there this summer.

QUARTZ AND PLACER.—Big Bug placer miners are said to be washing out lots of gold. The Howard mill, on the Hassayampa, is running on half time. Several mines in Yavapai county are listed on the Kansas City mining exchange. The shaft of the Black Horse continues in good ore. Messrs. Charmikie & Chambers are running the Lowell mill, on Lynx creek, with good success. Douglas Gray has deeded to E. M. Sanford nine mining claims in Turkey Creek district, for \$500. President De Kuhn of the Mockingbird Mining Co. is arranging for the construction of a new dam. Eight tons of ore arrived a few days ago at the sampling works from the Hillside mine. Geo. W. Sines and Charles H. Keyes have deeded the Beo Franklin mine, Hassayampa district, to Dan O'Boyle, for \$500. A deed has been filed for record from J. B. Tappan to D. M. Martio for the Occidental mine in Copper basin, for \$2000. President J. C. Brown and G. J. Baer of the Quartz Mountain M. Co. returned yesterday from that property. They report the mill still running. The company is also shipping a lot of high-grade ore. W. A. Long, formerly foreman of this office, has turned prospector, and has succeeded in finding some very promising ledges, as well as good placer ground. Deeds have been filed for record, transferring title to the Black Horse and White Horse, and two other mining claims from former owners to the Black Horse M. Co., the consideration named in the latter instrument being \$15,000.

COLORADO.

SILVERTON NOTES.—Miner, March 20: The strike in the Little Dora still holds out, and when better hoisting facilities are provided, the mine can easily output a carload per day. The Columbia lessees have about 50 tons of ore out, considerable stoping ground opened, and a future in sight that from this distance looks rosy. John Cotte, the lessee of the Lookout, was down from the mine this week making arrangements to open the trail and begin packing the winter's output. The Jennie Parker will open the road to the depot this week and resume shipping. There is ground enough opened now to put a force of ten men working on ore. A rich

strike of gray copper is reported in the North Star on Sultan. The mine is said to have never looked so well before, and the output for the next three months promises to be very heavy. Work is being pushed on a claim near the Burro bridge, owned by Linke, Fletcher & Milton. A crosscut has been run over 200 feet, and it is expected the vein will be cut in the next 20 feet at a depth of 100 feet from the surface. The North Star on Solomon is still drifting on the ore found in the 5th level. At one place the streak was six feet wide, all solid ore, worth from 200 to 500 ounces per ton. It has since narrowed to an average of six inches, and is liable to open out again at any time. There is 200 feet of stoping ground above the strike. Two men are pushing work on the Iowa, drifting on the ore to open up ground. Messrs. Robin & Thayer will employ 20 men on this property as soon as provisions can be taken up. There is plenty of ore in sight, and five tons daily is to be the output. The mine will be worked from both ends of the claim, and it is expected the ore from the south end will be clear profit.

THE AUSTIN.—Aspen Times, March 29: Howard Russell, the Bourquin brothers and associates have struck a new body of ore in the Austin lease, near the Climax. It is thought that they will soon be ready to ship pay ore.

THE LITTLE ANNIE.—Supt. McGee and George Besser came down from the Little Annie yesterday with average samples from a new two-foot streak of ore just struck in that mine. The average assay was 120 ounces silver and 44 per cent lead. This new strike, together with other bodies heretofore opened, places the Annie in the list of pay mines. The week's shipments from the Bushwhacker will amount to two carloads of ore, averaging over 100 ounces per ton. The 30-horse power hoister will be in running order on this mine by the 2d, when the force will be increased by adding about 10 miners. A joint survey is being made between the Park-Regent and Bushwhacker to determine the underground dividing line. The Iowa is looking well, a large body of spar has been struck which assays low, but it is thought will soon lead to pay ore. The property is being worked by the Iowa and Smuggler Mountain Mining Co.

DAKOTA.

SYNDICATE SMELTER.—Deadwood Pioneer, March 25: The little plant will probably not be blown in for another month. While in Chicago, Dr. Carpenter purchased for it some \$2000 worth of machinery, including another boiler. This will not be shipped for two weeks, and as it must then be erected, it is believed fully a month will elapse before the next run begins. The run will be made on Bald Mountain and Ruby Basins, as well as on ore from the Oro Fioo. Once started, the purpose is to keep the plant continuously in blast, the object in securing another boiler being to get sufficient power to keep the rock-crusher and furnaces in operation at the same time. The process, the Pioneer can repeat, and at length with the sanction of official authority, is a complete metallurgical and financial success.

IDAHO.

GOLD QUARTZ.—Idaho Statesman, March 29: D. W. Fitzwater, who arrived from Rocky Bar yesterday, tells of a big discovery made at Pine Grove of gold quartz. He says that it is the last, best and richest mine yet discovered in that camp. There are hundreds of tons of ore in sight, and this mine, with those formerly discovered, will keep the two quartz-mills located at that place with all the crushing they can do, and cause the town to boom during the coming summer. The mine or prospect is owned by several parties, among whom are D. B. Ethel and John Van Schaack.

CROSSCUT.—Idaho Avalanche, March 29: Supt. E. H. Dewey informs us that the crosscut being run by the Idaho & Pittsburgh Mining Co. to cut the Empire State and Black Jack lodes is being run five feet every 24 hours, which, considering that the crosscut is seven by five feet in the clear, is excellent work. He says he proposes to push the crosscut as fast as possible, to the end that the veins may be cut and a bonanza found.

SOMMERCAMP.—We understand that the Sommercamp group of mines is growing richer daily, and that a large quantity of shipping ore is in sight, which is being extracted and sacked. The gold-bearing lode is producing ore that will mill from \$30 to \$50 per ton, which, considering the size of the lode, is a bonanza to itself. From deep development work, it has been proven that the mines of Wagontown are not only rich, but large, and that the mines should be worked by deep shaft, through crosscuts, or tunnels, which strike the lodes at great depth.

LOWER CALIFORNIA.

REAL DEL CASTILLO.—Lower Californian, Mar. 21: The good news of discoveries at Alamo last week is well supplemented by the reports from the Real del Castillo. Mr. L. B. Howard of the Occidental M. & M. Co. returned Wednesday in a very happy mood, which was explained by the fact that his 550-foot tunnel into the Occidental had reached the vein, disclosing a 23-inch body of free-milling ore at a depth of 230 feet below the surface of the old works. The drills are now in solid rock, beyond which is the main vein, about four feet wide. This tunnel opens up an immense amount of ore, which can be easily shipped. It will be worked near by, in a ten-stamp mill soon to be built by the Occidental Co. A turbine wheel, operated by the San Rafael river, will furnish the power. The unsorted ore as run through the old Pueblo mill gave an average of \$20 per ton, and the quartz at 230 feet is of exactly the same quality as that in the old shaft. It is not a chimney ledge, but a true fissure vein, with well-defined walls. By the use of water-power the ore can be treated for considerably less than \$5 per ton. Mr. Howard is also connected with the Tepueste iron mines at San Isidro, and stated that a blast furnace would be built at San Diego for the treatment of ores as soon as a site could be decided upon. The Princess G. M. Co., recently formed in London with \$125,000 capital, to acquire and work part of a gold-mining property now in possession of the Mexican Land and Colonization Co. in the Alamo district, has already been noted. The mines included in the late purchase are the Ulysses, Cocinera,

San David, Priocesa, Spider, Grandissima, Moran and Iron Mask. A small quartz-crushing mill on the property in 40 days' operation crushed 375 tons of ore from five of these mines, the yield being 763.54 ounces of gold, valued at \$12,598. The mill has not yet crushed any ore from the Spider mine, but it is officially reported that the surface ore from this mine shows over \$100 per ton.

THE WORK AT ALAMO.—The hoisting works on the Indian mine are now nicely in operation. They are the most complete yet erected in the camp. Major Zimbleman has bought or leased the Elsinore and is building a chute at that mine. The Major is wide awake and he will soon be running again. The blanket ledge of conglomerate rock on the road between here and Mexico Gulch continues the subject of much interest. This is thought by many to be the richest thing yet found in the district. It consists of a very ordinary blanket porphyry ledge three feet below the surface, and it is said to be a meter thick and rich beyond calculation.

MONTANA.

IN THE VIPOND DISTRICT.—Inter-Mountain, March 26: Major B. J. Fine has a bond on the Wasego mine, in the Vipond district, which adjoins the Lone Pine property, on which a 20-stamp mill has recently been erected by Helena parties. There are five men at work; and two carloads of excellent ore were shipped to Butte yesterday which were sold by Major Fine to the Silver Bow Sampling Works. The shaft on the Wasego is now down to a depth of 80 feet, and the lead is from four to eight feet in width. There is every indication that it will develop into a valuable property. Shipments of ore to Butte will continue regularly.

ARGENTA DISTRICT.—Anaconda Review, March 27: In the Argenta district a very confident feeling prevails among those best posted on the resources of the camp, that the coming season will place them in a prosperous condition, and that their production and shipment of lead-silver bullion, with enough gold in it to make it a matter of interest, will be of sufficient magnitude to attract capital to properly develop and show up their properties. The P. J. Kelly Co. has been merged into the Argenta M. Co., and the new capital enlisted in this company has already paid off the indebtedness incurred by the old organization. The Tuscarora and Scott properties are not doing anything at present, but a rumor is afloat that W. A. Clark has authorized the starting up of these at an early date.

HOPE.—Phillipsburg Mail, March 27: From present indications around the Hope mine, we feel safe in saying that it will not be long until we will be producing as much ore as ever. There are several men at work in the mine at present. Work is being pushed on the Jubilee tunnel, below the hoist.

NEW MEXICO.

MOGOLLONS.—Silver City Enterprise, March 20: In the upper Dry creek region several parties are actively engaged in prospecting and opening up a number of valuable finds, which were located last year. Of the Lily, owned by Luke, Hussey and McCarthy, it is not saying too much to pronounce it as one of the most promising prospects in the Mogollon country. The developments consist principally of stripping the vein and open cuts, which as now exposed present to view one of the finest showings in the Southwest. A tunnel on the vein has been started, which will gain foot for foot from the horizontal as it penetrates the mountain. An average of a dozen assays made from careful sampling of the pay streak in a vein eight feet wide, has a value of \$600 per ton. The owners are now engaged in active preparations to open the mine thoroughly and develop it for all it is worth. Two miles and a half distant from the Lily, Baxter and Tennessee they have several valuable locations, from which they are taking a fine grade of ore.

OREGON.

GOLD-DUST.—Jacksonville Times, March 29: Considerable gold-dust has already been taken out here and there, and the amount will increase as the season progresses. Repairs have been completed at the Sterling M. Co.'s mines, and pining has begun a few days ago. A big run will no doubt be made there. There is still plenty of water and miners are making the most of it. A vast amount of gold-dust will no doubt be taken from the placers this season. Breeden & Schrimpf struck a pocket in their ledge on Applegate last week, from which they took over \$280. This is the same mine which John Swinden is now interested in. J. O. McGee of Williams creek, who was in Jacksonville yesterday, informed us that J. T. Layton had nearly completed repairing his ditches, and would probably commence pining in a short time. John Swinden has bought a half interest in the Adelphi mine on Applegate, formerly owned by Breeden & Schrimpf, and will continue to work the same in partnership with Mr. B. The consideration was \$1000. E. Sandersoo Smith is looking after Griffith & Co.'s quartz mine in the Steamboat district, and will prospect the same thoroughly in the interests of outside capitalists.

UTAH.

REVIEW.—Salt Lake Tribune, March 28: The week has been devoid of special feature. Stormy weather continues, and is anticipation of the spring break-up and its usual bad roads, the big ore-producers are laying in ore reserves and supplies at the mills and shipping points to last over the expected blockade. The receipts of the metals in this city for the week ending the 26th, inclusive, were to the value of \$111,409.03 in the aggregate, of which \$73,758.97 was in bullion and \$37,650.06 was in ore. For the week previous the receipts were to the value of \$61,660.68 in bullion and \$51,445.94 in ore, a total of \$113,106.62. The product of the Ontario for the week was in bullion 18,859.18 fine ounces. The Daly output for the week showed no transactions. The Horn Silver develops nothing new locally this week, its product and quality of ore being about as hitherto reported. The bullion receipts of the week foot up \$42,086.80; fine bars, \$3963. The Hanauer smelter produced during the week bullion valued at \$7950. Ore receipts to this city for the week were valued at \$232.16 by Wells, Fargo & Co.; \$24,700 by McCormick & Co.; \$10,637.90 by T. R. Jones & Co.

MECHANICAL PROGRESS.

American Tin Plates.

We have already noted the fact that tin plate had been produced on a small scale in Pittsburgh. Another and larger company has recently been formed in Chicago, to be known as the "Glendale Tin-Plate Company," which will procure their tin from the mines in Dakota. One of the officers of the company recently visited Pittsburgh, where he had gone to confer with the officers of the American Tinned Plate Association relative to the necessity of proper Congressional action for the protection of home tin-plate production. He said: "Tinned plate will be one of the chief industries of this country. All iron manufacturers ought to give their attention to this industry. It will, in the future, give the greatest opportunity for large profits. Just before I left Chicago I made a contract to furnish ten tons of tinned plate to a Chicago firm. That is the first order taken by an American firm. The prospects for the business are very bright. I think in four or five years enough American tin plate will be manufactured to supply the home market."

A box of tin plate manufactured in this country costs fully one-third more than in England—on account of the difference in the cost of labor between there and here. In the tin-plate mills of Wales whole families work at the business from the oldest to the youngest, both male and female, and at starvation prices. The present duty is not a protective one. It will barely admit the possibility of the manufacture without profit. But it is hoped that ere long, owing to the superior yield of the Dakota mines, the raw material may be furnished cheaper here than it can be produced abroad, and so admit of a small profit. Hope is also expressed that the duty proposed by the Senate bill will become a law, which, while it is not as high as it ought to be, still has the merit of being, to a certain extent, protective. If the tin-plate industry could be built up in this country, it would save for our people from thirty to forty millions of dollars a year which now goes to support the cheap labor of England. It would give employment, directly and indirectly, at the mine and the shop to fully 1,000,000 people—men, women and their dependents.

We have in this country the tin and the iron ore, the capital, the intelligence and all other facilities except protection against the cheap "family industry" of England. It is the duty of Congress to see that our capital and industry is protected against such odds.

NEW GERMAN INVENTIONS.—Kuhlow's *German Trade Review* notes the invention of pulleys made of hydraulic-pressed pasteboard and having an iron core and strong casing. It is said that the friction of such pulleys is considerably greater than that of cast-iron pulleys, and with an equal useful effect they therefore take up less space. As the tension of belting on paper pulleys need not be so great as on iron pulleys, the vibration is less, and to that extent the buildings, etc., are saved. The manufacturers affirm that these pulleys are proof against water. They are made of the well-known oil paper of which paper railway wheels are made. Some other interesting achievements with paper, says the same journal, have been accomplished by a paper goods manufacturer at Dresden, who by means of compressed, chemically prepared paper has succeeded in producing bandlees and shafts which are characterized by great endurance. A file-handle submitted as a sample presents a woodlike appearance, a brown shining surface, and is very hard. It is light, and has probably the advantage of being a bad conductor of heat. It sometimes happens that in the use of wooden handle splinters get forced into one's hand, but with the use of paper handle that danger is entirely obviated. The invention would appear to be an important one.

MECHANICAL DRAWING.—In discussing the importance of a knowledge of drawing to the mechanic engaged in any of the building trades, one of our English exchange observes: The interpretation of drawings by artificers connected with building will be necessarily imperfect till the art is made one of the acquirements of the workman. In England the subject has never been brought down to the level of the workman's knowledge, and only of late years has there been any attempt to teach drawing to workmen in a systematic manner. The technical schools in France and Germany have long made drawing an essential mode of training the eye and hand. Every trade has to pass through the stages of drawing. Copying from paper examples is forbidden in some schools, and the system is to get the pupil to draw from models, so as to teach him to apprehend the meaning of lines in perspective, as well as to make him understand geometrical delineations. In our opinion, drawing can only be properly taught by the aid of models, and a course of well-directed model drawing will do more to instruct the eye and mind than all the flat copies and diagrams of the text-book.

SPIRALLY WELDED TUBES.—To which we have made several allusions, are made by automatic machinery out of steel strip, which is of very mild quality and welds perfectly. It is rolled in strips of from 12 to 18 inches wide and as long as possible. For long tubes, several are

welded together. The steel is fed by rollers into the pipe-forming machine, where it is wound into a spiral, raised to a welding heat by blowpipes of water gas, the joint being finished by a light and rapidly-working hammer. The longest tube yet made was 57 feet long and 10 inches in diameter.

ARTISTIC PROGRESS IN FLINT GLASS.—The progress that the flint-glass trade is making in an artistic direction is truly wonderful. A walk along the streets of any of our large cities will reveal some very beautiful designs, the result of processes heretofore unknown to the glass trade. The discovery of an improved method of staining ware is very important. Pressed ware is now colored to either represent ruby, amber, blue, or in fact any of the colors now turned out in glass. It is so clear and brilliant that it takes a practical eye to discover the difference between it and the real article. There is nothing to indicate that the ware is not of the real color, outside of the fact that it is usually placed on pressed ware, and everybody connected with the trade knows that real ruby is seldom used in pressed ware. An outsider could never discover the difference. It can be placed on the pressed imitation of cut ware in such a way that no one would think the glass was plated with the color and then partially cut away. The use of this idea on railroad signal lanterns might be much of an improvement over those in use that are merely painted red.—*Commoner and Glass Worker.*

GERMAN SEWING MACHINES.—Germans are making 50,000 sewing machines per annum and claim that they are competing successfully with manufacturers in the United States. Many machines go to South America. Our Consul at Mannheim says: An enterprising firm whose founder is a citizen of the United States designs making regular shipments to this country, with names and ornamental engravings suited to the German population. This firm is the second largest in the Empire; it produces about 30,000 machines in a year and employs about 700 hands. They manufacture the Singer machine. With this they are heating our manufacturers, so they claim, in every country outside of the United States, because they produce and sell a much cheaper, if inferior, article, because ours is better only in finish and decoration, and therefore answer the people's wants just as well. This manufacturer confessed that his iron castings are by no means as good as ours, and that we have lots of better machines than those of German make.

FINE MECHANISM.—Some wonderful examples of human ingenuity and skill, which illustrate in a remarkable way the progress made in mechanics, have been put on exhibition by the London Mechanical and Scientific Society. An instrument loaned by the great Armstrong Gun Works accurately measures thickness down to the one-thousandth part of an inch, while a rival mechanism exhibits an instrument built on similar principles, which grades thicknesses in millionth parts. The deft-fingered Ostling, whose wonderful balances have a world-wide reputation, shows a delicate scale which will carry 3000 grains and yet turn distinctly with the one-thousandth part of a single grain. A watchmaker of Paddington now comes in for his share of praise and exhibits an engine built of 122 pieces, not including 33 bolts and screws, nicely hidden in a lady's No. 7 thimble. If inventors of great things deserve great praise, what shall we say for the skilled fingers and clear brains which fashioned the above?

REDUCING FRICTION IN ELECTRICAL MACHINERY.—Numerous experiments have been made recently in reducing the friction in the bearings of dynamos and electric trolley-wheels. The Thomson-Houston Electric Company is now investigating a system, by the use of which it is said the reduction in friction would net a saving of over 10 horse power out of every 1000-horse power. At present the new system is being applied experimentally to the trolley-wheel. With the present system the bearings wear out rapidly and have to be replaced about once a month. In an experiment with the roller bearing, the rim of the wheel wore off while the bearing remained in good condition.

THE LARGEST STEEL FLUME IN THE COUNTRY.—And probably in the world, is now being constructed for the Spokane Hydraulic Mining Company. The flume will be an immense steel pipe 4½ miles long, carrying water from the old California ditch, at the head of Pritchard Creek, in the Coeur d'Alene mining district, above Murray, to the Old Wash gold diggings. The flume will be made of heavy steel pipe, 22 inches in diameter.

IMPROVED PLANT.—A large saving in the cost of heavy guns has been effected in the Washington foundry by the use of the improved plant. Eight-inch guns now cost only \$14,623, or \$3000 less than was recently paid for guns half that size. Sufficient attention to economy in that direction is not as general in our large shops as it should be.

A STOVE OVEN THERMOMETER.—An improved oven thermometer, a device to be applied to the oven doors of cooking stoves, ranges, etc., to indicate the exact heat for baking purposes, has lately been patented by a firm in Ohio.

SCIENTIFIC PROGRESS.

The Influence of the Earth's Rotation on Moving Bodies.

A late German writer, T. von Barier, says: It has often been observed that in railway lines running north and south there occurs, in course of time, an appreciable displacement of the rails, always more noticeable on the right-hand side going south. This is, as the author remarks, chiefly due to the effect of the rotation of the earth on its axis, the normal condition being that with a train traveling in such a direction and equally loaded, there is a greater pressure on the right-hand side than on the left.

In north latitude 51°, a man weighing 165 pounds, running at the rate of 13 feet per second from north to south, sustains a horizontal pressure toward the east equal to 54 grains, which, acting at the center of gravity of the body at, say three feet three inches above the ground, necessitates an extra pressure on the right foot of 0.63 ounces, in order to maintain the vertical position of the body. In going from south to north the proportion is the same; in the southern hemisphere the extra pressure would come on the left side. With varying directions the force is, of course, proportionately varied.

In the case of an express train, weighing, say, 400 tons, traveling northward at the rate of 50 miles an hour, the extra pressure on the right hand or eastern rail amounts to 501 pounds, the same pressure coming on the right-hand or western rail when traveling in the reverse direction. In more northerly parts the lateral force increases, reaching its maximum at the north pole, in which region, in a case similar to the preceding, the extra pressure on the right-hand side would be 660 pounds. In the large ocean steamers the force is considerably greater, the side pressure on the Inman liner, City of New York, being about 936 pounds. The tendency of this lateral pressure would be to drive the vessel (if on a northward or southward course) somewhat to the east, so that to keep on a prescribed course requires a slightly increased engine-power to overcome the tendency to deviation. This increase is, however, not more than 110,000. Such as it is, it is appreciable on the east and west run between Liverpool and New York, but would be distinctly perceptible in a voyage to Buenos Ayres.

The Ice Period of North America.

Ever since the commencement of the present century, the Glacial Period or Ice Age of the North American Continent has occupied much of the attention of geologists and other scientists. General attention was first called to the matter by the investigations and publications of the elder Prof. Hitchcock. There appear to be three distinct eras of progression in the discussion of the question, as follows:

First. From 1800 to about 1850, when the belief was quite general that the entire northern portion of the continent was submerged and covered with floating icebergs, moving in a southerly direction, hazing their course by deep groves in the rocks, scooping out little valleys, etc.

Second. From 1850 to 1875, during which period the submergence and iceberg theory gradually gave way to glacial action—immense rivers of ice which flowed or plowed their way southerly over the continent, leaving the same marks of progress which had previously been attributed to icebergs.

Third, and lastly, since 1875 the idea has been gradually gaining ground that previous theories have been quite too superficial to account for all the phenomena observed almost everywhere on the central and northern face of the continent, and that our theories in this connection must be remodeled.

Prof. C. H. Hitchcock of Dartmouth College, N. H., has recently written a review of "Wright's Ice Age of North America," which is replete with information on this subject. Mr. Wright, in connection with the late Prof. H. C. Lewis, made a special work of the study of the phenomena connected with the Ice Age of the continent, and especially of the great terminal moraine which they traced through New Jersey, Pennsylvania, Ohio, Kentucky and Indiana. They also spent a summer on the great Muir Glacier of Alaska. In their record of this examination they say that "this glacier is located at the head of Glacier bay, in latitude 50° 50' and longitude 136° 60', with mountains over 15,000 feet high between itself and the Pacific ocean. The glacier is formed from nine branches and 17 branchlets, which discharge into the inlet from a point of 300 feet." The movement of the ice was 40 feet per day on the eldes and 70 feet in the center. The water-front of the glacier is about one mile across, from which bergs are almost continually falling off. The entire period of the continuance of the Ice Age is estimated by Prof. Prentiss to have been from 15,000 to 25,000 years. The study of this problem and the phenomena connected with it is one of the most interesting which has ever engaged the attention of the geologist.

A CARBONIC OXIDE INDICATOR.—An apparatus for indicating the presence of carbonic oxide gas in the atmosphere has been perfected by M. Rasine. Its action depends on the prop-

erty of spoozy platinum to absorb carbonic oxide with evolution of sensible heat. Two metallic plates are placed vertically over each other, which, when touching, close an electric circuit. The upper plate is suspended from a hook by means of an easily combustible thread. This thread is wrapped in muslin, containing a little cotton powder dusted over with spoozy platinum. If this arrangement is exposed in an atmosphere containing carbonic oxide, the spoozy platinum will absorb it and set fire to the cotton, which will in turn burn the thread, and so cause the electrical contacts to complete the circuit and ring a bell.

THE HUMAN BODY IMPROVED.—We have all heard a great deal from time to time regarding the perfect adaptability of the human body to the various uses for which it is intended, and we have been taught to believe that, considered simply as a machine for accomplishing certain things, it was well-nigh ideal perfection, and left no room for improvement. It seems, however, that a Russian inventor thinks differently, and has taken out patents, both at home and in this country, for what might be called "Improvements to the Human Body, Designed to Facilitate Walking, Running and Jumping." The drawings show two large springs in the shape of a bow, their upper extremities attached to the shoulders or at either side of the waist, and the lower extremities to the feet. The necessary hands and buckles and harness for securing the springs are variously disposed about the body.

CINCHONA TREES IN SAN FRANCISCO.—Adolph Sutro is trying the experiment of raising cinchona trees near San Francisco. "If he succeeds," says an exchange, "he will not only have some very ornamental trees, but demonstrate that the raw material for quinine can be produced in this country." By late accounts it appears that the Cedron bean is likely to eventually supplant quinine. The extract from this bean or seed is said to possess all the virtues of the cinchona or Peruvian bark, while it produces no unfavorable effect upon the head. Its action is mild—not unpleasant as quinine is, but very effective in malaria, chills and fever, colds, etc.

DESTROYING AND RENEWING THE EXPLOSIVE POWER OF NITRO-GLYCERINE.—Another man claims to have made a discovery which will "revolutionize the art of war." His name is Schwahn and he lives in New York. His invention is a neutralizer of nitro-glycerine. He mixes the two and the compound will burn with a blue flame but not explode; but by pouring water over the compound the two elements separate and the deadly properties of the nitro-glycerine are restored.

A DISCOVERY.—It is said that a man in Woodhull, N. Y., has secured a patent on making hemlock trees yield bark perpetually. Ordinarily, stripping the bark from a tree kills it; but this Woodhull inventor applies a solution to the tree, after peeling, that excludes the air, and the result is a new crop of bark the next year. If he has obtained a patent for his alleged invention, he must have satisfied the Patent Office that he really can do what he claims.

DETERMINATION OF SILICON IN IRON.—To determine the quantity of silicon in iron, Clerc heats one grain of the powdered specimen with 15 to 20 cc. of water, 10 cc. bromine, and 75 cc. of hydrochloric acid, to 100°. After the solution is completed he thins it with from 200 to 300 cc. of hot water, filters, washes the remainder, calcines and weighs the silicon. The experiment occupies little time and is exact.

INSECT LIFE.—It is said that there are over 1,000,000 species of insects upon the earth. There is no region free from insect life. What any animal can do, some insect can do; what any animal can eat, some insect can eat; there is no mode of progression used by any animal that some insect does not use. Their antipathy of classification is most perfect.

A NEW RANGE FINDER is spoken of in Berlin which is said to be superior to anything of the kind in existence. Up to 7000 yards it indicates distances with a degree of accuracy hitherto unapproached. The instrument, the readings of which are determined by geometrical methods, is the invention of Capt. Erle, a staff officer of the German artillery.

THE ALEXANDRINE BLUE has again been discovered, according to a French mineralogist who claims to have discovered in a mixture of copper and lime the beautiful color azurine, the composition of which has long been a puzzle to artists. His tint is said to be perfectly unchangeable, and is identical with the famous Alexandrine blue.

NOT INJURIOUS.—It appears to be dawned upon Congress, as well as upon the country generally, says the *New York Shipping List*, that the mixing of pure cotton-seed oil with lard, although it may be an adulterant, is not unhealthful, etc., but an absolute improvement in every way.

SCIENCE TEACHING IN CHINA.—It is a curious fact to notice that in China scientific subjects are being taught by Japanese instructors who have acquired their technical education in this country, and that the teachers are using the English language with their classes.

GOOD HEALTH.

TOOTHACHE.—The president of the Midland Branch of the British Dental Association, Mr. H. C. Quilby, protests against the present extravagant waste of human teeth by country surgeons and incompetent dentists, and declares that, while there may be sufficient reasons for extracting a tooth, it is never necessary to do so merely to relieve pain. In at least 90 per cent of the cases coming to an active dentist, pains from teeth are due to what may be called primary and secondary toothache. Primary toothache, the pain of which is often felt in the nerve terminals in the face than in the tooth itself, is congestion of the tooth pulp, and it may be relieved very easily by careful excavation sufficient to allow an escape of blood from the pulp, which may then be devitalized by an arsenical dressing. To complete the operation, which may be postponed for weeks without further inconvenience, the pulp must be removed from the root canal, and these filled to the apex. Secondary toothache, or alveolar abscess, is caused by gangrene of the pulp, and is regarded by most surgeons as so serious as to call for a removal of the tooth, which in nine cases out of ten might be retained and made useful and comfortable. The course of treatment is an opening to the pulp to relieve the pain, followed by a series of antiseptic dressings in the roots to cleanse them from all putrescent matter, and then, as in the other case, filling them to the apex.

OPERATIONS ON THE LIVER.—The fatal result attendant upon an operation on the liver of a lady in Grass Valley furnishes no good reason why, under favorable conditions, such operations may not be successful. In the course of long investigation, Prof. Poncio de Breslan has made the important discovery that a large part of the liver—even as much as three-fourths—may be removed without serious disturbance of the animal functions. Surgeons had before known that the whole of the liver is not absolutely essential to health, but could hardly suppose that the sudden destruction of a considerable part of it would not be serious, and now may be enabled to perform operations hitherto believed to be impossible. Prof. Poncio found that the liver has a wonderful power of reproduction, in some cases a portion equal to two-thirds being replaced by a new growth within a few weeks.

LOOKING BACKWARD ON LA GRIFFE.—There were altogether about 300 distinct epidemics of influenza or la gripe in Europe between 1510, when the disease was first noted at Malta, and 1850. In 1729 the whole of Europe suffered severely. According to statistics published by the *Nove Vermya*, the disease caused 908 deaths in London in one week, and in Vienna 60,000 persons were affected. In 1737 and 1743 there were further outbreaks, and the deaths in one week in London amounted to 1000. In 1775, domestic animals were first attacked by it. In 1785, 50,000 persons fell ill of it in St. Petersburg in 24 hours. In St. Petersburg, quinine is now served out daily to the troops.

DIPHTHERIA.—The *Scientific American* recommends the following: At the first indication of diphtheria in the throat of a child, make the room close, then take a tin cup and pour into it a quantity of tar and turpentine, equal parts; then hold the cup over a fire, so as to fill the room with fumes. The little patient, on inhaling the fumes, will cough up and spit out all the membranous matter, and the diphtheria will pass out. The fumes of the tar and turpentine loosen the matter in the throat and thus afford the relief that has baffled the skill of physicians.

DEADLY WORK OF NICOTINE.—In France, experiments were made to show the effect of tobacco smoke on meat and other food, including vegetables. A piece of rare meat, after being exposed for some time to tobacco smoke, was offered to a dog, which refused to touch it. It was then concealed in some palatable covering, and the dog ate it and died in a short time. An autopsy showed nicotine poisoning to have caused death.

A CHOLERA SPECIFIC.—A report comes from India that a specific has at last been found for the terrible scourge of cholera, and that out of 18 patients treated with the drug, the name of which is *salol*, not one succumbed to the disease, although some of them were in a state of collapse when the drug was administered.

PROFESSIONAL ATHLETES.—"Show me a professional athlete 40 years old," says an eminent physician, "and I will show you an old man beyond his time, with bones out of shape, muscles injured, and joints stiffened, and no one would promise him five years more of life."

A NEW USE FOR ELECTRICITY.—It is claimed that wall paper can be made in such a way that the passage of low-tension electric currents will heat it moderately warm to the touch and diffuse throughout the room an agreeable temperature.

EIGHT VARIETIES OF LEPROSY are recognized in China, and the disease is recognized as contagious, infectious and hereditary, but is said to disappear in four generations.

ELECTRICITY.

Storage Batteries.

A few months ago, comparatively speaking, the electrical scientists were interested only in the action of the secondary or storage battery. Some prophecies were made as to what it might be in the practical world, but these prophecies were merely looked upon as the enthusiastic expression of dreamers. To-day the country is full of storage batteries of many makes, and the Patent Office reports new inventions and improvements every week. To-day a storage battery is useful in many ways, is almost a necessity in some cases, and, as a prominent electrician of the country said the other day, "the storage battery, even as frail and uncertain as it is now, is a necessary evil." As the storage battery—or, by another name, the accumulator—stands to-day, its usefulness for work depends upon partially known laws of chemistry and common-sense laws of mechanism. The chemical laws taken advantage of by the maker of any accumulator are invariably the same.

Electricity, like water, depends for its power of doing work on two conditions: quantity and force; its potentiality increases according to the place where it is produced as compared with that at some other place. The difference of potential corresponds with the difference of level in liquids, with the difference of pressure in gases, with the difference of temperature in heat. As the sea level is the standard for measuring the height of a mountain, so are electric levels measured from the arbitrary level of the potential of the earth.

A storage battery does not store electricity any more than the spring of a clock can be said to store time or sound; it stores energy. The energy of an electric current is used to produce a decomposition of metal of such a nature as will independently produce a current on the removal of the original current. The cells or accumulators are two plates of metals immersed in a liquid acid which is called the electrolyte, and which cannot act on the plates until after an electric current has passed through it, which effects its decomposition in depositing its positive and negative constituents on the plates. On the cessation of the current the cells are discharged by a connection outside the liquid, in the opposite direction. Plates of compressed litharge have been recently used, and many experiments are being made in the hopes of obtaining such results as will avoid the necessity of using a dynamo. Electric meters are those in which a portion of the current passes through a solution of a metallic salt, and the strength is determined by the amount of electrolytic decomposition it effects. There is also an electro-thermal meter to measure the heat caused by a certain resistance, or by the amount of a liquid evaporated by the heat generated by the current; and an electro-magnetic meter, in which the current is measured by the magnetic effects it produces upon a needle by deflecting it.

Electricity and Mechanism.

The most notable thing about the late Convention of the National Electric Light Association at Kansas City was that there was so little said and discussed about electricity, and so much about engineering and construction. The situation seemed to have been very well summed up by one of the speakers when he said: "The mechanical part of electrical construction is practically all of it." It does not follow from this that we know all about electricity and that we are done with the study of that part of it, but it is beginning to be an accepted fact that the question of the commercial success of the electric-lighting business hinges upon such plain engineering matters as the construction of boilers and engines, and upon the generation and transmission of power.

Apart from the discussion of purely business matters, the principal papers of the meeting were those upon the subjects of the steam engine, the steam boiler and the construction of a suitable building in which to put them.

Electrical engineering is rapidly working over into the domain of mechanical engineering, and electricity is taking a place among the available forces of nature as much as the forces of gravitation or the vibration of heat. This does not necessarily mean that the mechanical engineer must become an electrician, for the study of electrical phenomena should remain in the field of the physicist just as the investigation of heat, light and sound have done.

Still, whenever any of the natural forces are to be set to work, and the question of dollars and cents enters into the problem, then the mechanical engineer steps in, and it is in his hands that the most effective practical work will be done.

ELECTRICAL TRANSMISSION.—The current to be used in lighting the streets of Portland, Or., will be generated 12 miles away. This is thought to be the longest distance over which the transmission of electrical power has been attempted in this country. The current is to have an electro-motive force of 4000 volts.

STORAGE BATTERIES FOR STREET CARS.—There is no doubt about the mechanical success of electric motor cars run by storage batteries, and that seems to have been all that was demonstrated in the trial on the Lehigh avenue road

last Wednesday. Repeated experiments have shown this to be the ideal system for the running of street cars, provided the cost be not too great. On this subject we have the estimate of President Wharton that the cost will be less than that of running the cars by horse-power.—*Philadelphia Ledger*.

USEFUL INFORMATION.

THE NICKEL IN THE METRIC SYSTEM.—Somebody of an ingenious turn of mind gives us the metric system, "not in a nutshell," but in a nickel. It is claimed that our nickel five-cent piece holds the key to the linear measures and weights. The diameter of this coin is two centimeters, and its weight is five grammes. Five of them placed in a row will, of course, give the length of the decimeter, and two of them will weigh a decogramme. As the kiloliter is a cubic meter, the key to the measures of length, it is also the key to the measures of capacity. Any person, therefore, who is fortunate enough to own a five-cent nickel, may carry in his pocket the entire metric system of weights and measures.—*Cleveland Plaindealer*.

THE DYNAMITE GUN INDUSTRY promises to assume quite an important position among the industries of the country. The British Government has an order already placed with the Pneumatic Dynamite Company at the East for 50 guns which will involve a cost not much under \$1,500,000. The Italian Government, it is said, is considering the question of ordering a dozen or more dynamite guns, and will also fit out a cruiser mounted with these pieces after the manner employed in the Vesuvius. At present the Pneumatic Dynamite Company is engaged in supplying the United States Government with five 15-inch guns, in addition to the two already constructed.

EUROPE'S FUTURE INDUSTRIAL CENTER.—Whatever may be said to the contrary, it will be many years before the coal supply of England for practical industrial uses will become exhausted. It is more than probable that even within the lifetime of some now living her industrial supremacy will depart with the exhaustion of her coal-fields. Then Switzerland, Italy and the Scandinavian peninsula, or some other more abundant coal regions yet to be discovered, will become the great manufacturing centers of Europe. But ere that time the great industrial center of the world will be the United States of America.

NATURAL GAS INVESTMENTS.—The capital invested in the supply of natural gas is enormous. At the date of the official report in 1888, one Pittsburgh company had a capital of \$12,000,000, and the total capitalization of all the companies in the various States was estimated at \$90,000,000. The hundreds of companies that have organized, prospected, bored, struck water and disbanded since then, will swell that amount to almost incredible proportions.

A SEA-SHORE WITHIN DOORS.—The children of a Philadelphia household can play on the beach all the year round, to all intents and purposes. The indulgent and somewhat ingenious papa had a half-dozen barrels of Cape May sand shipped from the shore, and now it does service on the play-room floor, where the babies romp with bucket and shovel just as they did last midsummer. He opened a new barrel on Christmas Day.

CHEAP MONEY EAST.—A few days since a little village in Massachusetts sold \$50,000 worth of 3½ per cent bonds at a premium of nearly \$2000, and yet the holders were no sadder than those being issued by our irrigation districts. It would pay some of the irrigation districts to send an agent to Eastern money centers and place the bonds there. This city is paying as high as seven per cent for some of its indebtedness.

PYROTECHNIC EFFECTS in table decoration are rampant. Electric wires are run through the stems of tulips, white lilies and jonquills; a bunch of them planted in an epergne give the red, yellow, green and brown tints the glow of enchantment, and when the white bright light streams from a plaque of nuts, the sensation is rather more weird than poetic.

INK STAINS ON SILVER.—The tops and other portions of silver inkstands frequently become deeply discolored with ink, which is difficult to remove by ordinary means. It may, however, be completely eradicated by making a little chloride of lime into a paste with water, and rubbing it upon the stain.

VARNISHING NEW COPPER WORK.—In varnishing new copper work, use boiled linseed oil; it stands the weather as well as the best coach varnish, although it does not make so smooth a surface, and is much cheaper. Two coats are sufficient; let the first coat dry thoroughly before the second is applied.

GERMAN SAUSAGES.—It came out in an English court a short time since that 100 worn-out horses had just been shipped from that country to Germany and Belgium to be used in the manufacture of sausage, and that such shipments were a regular thing.

THE BUILDER.

Resonance of Buildings.

There are some buildings which are so utterly bad from the acoustic point of view that even experienced speakers are little better off than novices, says Sir Morrell Mackenzie in the *Contemporary Review*. The House of Lords has, or used to have, an unenviable reputation in this respect, and in 1848 it was so difficult for speakers to make themselves heard in the French chambers that a committee, consisting of the leading scientific luminaries of the day, was appointed to study the case and suggest a remedy. After numerous experiments they hit upon a contrivance, designed on the most scientific principles, which was to make the orator's voice ring like a clarion to the farthest benches. The last state of the speaker, however, was worse than the first; he felt as if his voice was stifled under a huge nightcap, and the highly scientific sound reflector had to be discarded as a failure.

Indeed, modern public buildings are so often defective in this respect that I am not surprised to find M. Ch. Garnier, who designed the Grand Opera in Paris, exclaiming dolefully: "The science of the theatrical acoustics is still in its infancy, and the result in any given case is uncertain." One of the most remarkable buildings from the acoustic point of view that I have ever seen is the beehive-shaped temple in Salt Lake City. It holds from 12,000 to 14,000 people, and one can literally hear a pin fall. When I was in the temple, with some other travelers, in 1882, the functionary corresponding to the verger of ordinary churches, stood at the farthest end and dropped a pin into his hat, the fall of which was distinctly heard at the opposite end. The resonance of the building is so loud that branches of trees have to be suspended from the ceiling in several places in order to diminish it. It is likely enough that Brigham Young's inspiration had not a very recumbent and purely terrestrial source, for the beehive is only a slight modification of the whispering gallery in St. Paul's. The bad acoustic properties of buildings may be remedied by what doctors call "palliative treatment."

Charles Dickens' experience as a public reader made him a man of ready resource in meeting such difficulties. On one occasion, when he was going to lecture at Leeds, Edmund Yates, who had spoken in the same hall the evening before, sent him word that the acoustic conditions of the place were very bad. Dickens at once telegraphed instruction that curtains should be hung round the walls at the back of the gallery; by this means he was able to make himself more easily heard.

One of the halls in the Pioneer building of this city has its walls on three sides hung with curtains, without which it would be almost impossible to use it for public speaking.

SLATE AN UNSAFE ROOFING.—A writer in the *Milling World* says: Slate is not a safe material for mill roofs. Not long ago I saw a slate-roofed mill fired by heat from an adjoining building. The heat cracked the slates and they ran off the roof in a shower, leaving dry wood exposed to the flames. Another building covered with shingle was equally exposed, and singularly enough, the roof of the slate-covered mill took fire before the roof of the shingle-covered building. The streams of water turned on the slates after they became hot, caused their rapid destruction, while the wetted shingle were kept from hurrying. The slate roof allowed streams of water to drip downward through the entire building, while the shingle roof protected the building which it covered. Slate roofs may prevent fires from floating sparks, and shingle roofs when very dry may invite fires from such sparks, but where buildings are crowded closely together, almost any one of the roofing materials is better and safer than slate, because in the case of crowded buildings the slate is exposed to heat sufficient to break it and uncover the wood.

A CHIMNEY THAT WILL DRAW.—To build a chimney that will draw forever and not fill up with soot, you must build it large enough, 16 inches square; use good brick and clay instead of lime up to the comb; plaster it inside with clay mixed with salt; for chimney tops use the very best of brick, wet them and lay them in cement mortar. The chimney should not be built tight to beams and rafters; there is where the cracks in your chimneys come, and where most of the fires originate, as the chimney sometimes gets red-hot. A chimney built from cellar up is better and less dangerous than one hung on the wall. Don't get your stovepipe hole too close to the ceiling—18 inches from it.—*Ec.*

A NEW BUILDING SYSTEM.—A Paris architect proposes a system of building houses entirely of sheet iron, the walls, partitions, roofs and wainscoting to be composed of double metallic sheets separated by an air mattress, surrounded by different substances non-conductive of heat. The chief merit claimed for this plan is the incombustibility which it secures, and, as the metal employed allows of the most varied forms of ornamentation, the general aspect may be made as pleasing as that produced by the ordinary materials in use.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Hinkle's Centrifugal Quartz Mill with Plates and "Slammer"; The Eckart Rolls for Crushing Ore; Section of Eckart Rolls, 229. Ideal View of an Ancient Lake; The Lake Bed Covered by Earthy Eruptive Matter; Result of Geological Changes Producing Present Changes, 237.

EDITORIALS.—The Eckart Rolls; A New Centrifugal Quartz Mill, 229. Passing Events; Revival of Mining Share Speculation; The Low Tariff on Lead; Stewart Mining Bill, 238. Sampling Ore, 239.

CORRESPONDENCE.—The Stewart Mining Bill, The Deep Placers of California, 230-231.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 232-233.

MECHANICAL PROGRESS.—American Tin Plates; New German Invention; Mechanical Drawing; Artistic Progress in Flint Glass; German Sewing Machines; Fine Mechanism; Reducing Friction in Electrical Machinery; Improved Plant; A Stove Oven Thermometer, 234.

SCIENTIFIC PROGRESS.—The Influence of the Earth's Rotation on Moving Bodies; The Ice Period of North America; The Human Body Improved; Cinchona Trees in San Francisco; Destroying and Renewing the Explosive Power of Nitro Glycerine; A Discovery; Determination of Silicon in Iron; Insect Life; Not Injurious; Science Teaching in China, 234.

GOOD HEALTH.—Toothache; Operations on the Liver; Looking Backward on La Grippe; Diphtheria; Deadly Work of Nicotine; A Cholera Specific; Professional Athletics; A New Use for Electricity, 235.

ELECTRICITY.—Storage Batteries; Electricity and Mechanism; Electrical Transmission; Storage Batteries for Street Cars, 235.

USEFUL INFORMATION.—The Nickel in the Metric System; Europe's Future Industrial Center; Natural Gas Investments; A Sea Shore Within Doors; Cheap Money East; Ink Stains on Silver; Varnishing New Copper Work; German Sauces, 235.

THE BUILDER.—Resonance of Buildings; State an Unsafe Roofing; A Chimney that Will Draw; A New Building System, 235.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 242.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, 242.

Business Announcements.

[NEW THIS ISSUE.]

Locomotive Engines—Burnham, Parry, Williams & Co., Philadelphia, Pa.
Assessment Notice—Acme Mill and Mining Co.
Dividend Notice—Pacific Box, Salt & Soda Co.
Mining Engineers—Berwick, Moring & Hooper.

Passing Events.

There is very little change in the situation of affairs at the foundries. The molders are still out on strike, and work is still going out of the city to be done elsewhere. The foundrymen are getting on the best way they can with such hands as they are able to get. Only one foundry has its quota of molders, and this one is doing the casting for those other shops which are running.

The developments in quartz in Lower California are encouraging to the owners, for they find that these ledges "go down." At a depth of 350 feet the veins are found to be of good size and still rich.

More or less coal from Japan is coming now to this market, and arrangements are being made to put suitable plants in the mines of that country, so that coal shipments may be largely increased.

The men at the granite quarries at Rooklin, Placer Co., have gone on a strike, objecting to work more than nine hours.

The destruction by fire of the Cusiuhirlobio reduction works, 75 miles from Ohlnahua, Mexico, involves a serious loss. These works have been using the leaching process. They were built by a New York company.

Revival of Mining Share Speculation.

After a depression of about one year, when the shares of the Mexican and Union Mining Companies advanced from \$3 and \$2 to \$8.50 and \$7.25 respectively, the mining share market is again on the up move, with, this time, Potosi and Chollar stocks in the lead. The MINING AND SCIENTIFIC PRESS, from time to time, has called attention to the importance of the work going on, not only on those two mines, but to several others where further explorative work to the west would be rewarded by finding what is called the west ledge or Red lode. Of course it remains to be seen how rich in mineral and large it will prove, but one fact, which is already witnessed by the activity of Chollar and Potosi shares, is apparent, and that is it will revitalize speculation in the Comstock mining share market, which invariably brings into more prominence the mining industry of the coast.

That the present movement is based on merit, appears probable, yet outside speculators may, as has heretofore been the case, rush in to buy the stock regardless of what it costs, under the impression that there is a bonanza in sight. While all present information warrants the assertion that the Red lode, which is mostly gold-bearing, is very rich, yet the paying ore is not very wide; but it has a sufficient width to admit of dividends being paid by the mines that are run honestly.

In referring to the present situation, which is confirmatory of former statements made by the MINING AND SCIENTIFIC PRESS, the Virginia Enterprise of March 30th says:

In the Chollar mine the chances are very favorable that they will strike the continuation of the Hale & Norcross ore body, found on the 700 level, in the Chollar crosscuts on the 750 level toward the north end of their claim. If it is found there, the fact will be established that there are millions of dollars yet to be extracted from that ore body, which has already panned out \$1,650,000.

In the Con. Cal. & Va., a strong force of miners has been placed at work on the 1300 level on the continuation of the ore found by W. H. Patton in 1886-7 on the 1500 level. No work has ever been done on the 800 level of the Con. Cal. & Va., excepting one crosscut to the west, which was too far to the north to intercept the continuation of any ore body yet found in the mine, considering their dip and inclination, and it is in the power of no man to say that as much ore and as much money cannot be taken out of that level as has been extracted from any other level in that mine.

The Segregated Belcher mine has 1000 feet in depth of virgin ground to explore, with good prospects of finding as extensive bodies of ore as were revealed in either Crown Point or Belcher, as their work is in most interesting ground.

Overman has a most promising body of pay ore on the 1200 level, well up to the north, adjoining Segregated Belcher, upon which very little prospecting has been done, the management confining their work merely to the extraction of the ore as it is needed for the mill. It is calculated that this ore extends into the Segregated Belcher, and that it is second in importance to but few ore bodies now being worked on the Comstock.

No ledge of quartz looking as the Potosi vein from the 930 level upward does, and carrying the precious metals as it does, has ever been found on the Comstock from which millions of dollars have not been taken. The Hardy vein in the Ophir, struck in the early '80s, was probably the smallest vein found on the lode, it being only about 10 feet in width, panned out \$4,000,000, and \$1,500,000 was paid in dividends out of it. The Hale & Norcross last ore find, made after experts and practical miners pronounced the mine worked out, has already produced over a million and a half of money, and it is but partly developed as yet.

REPORTING ON MINES.—Messrs. Bewick & Moreing, mining engineers of Suffolk House, Laurence, Pountney Hill, London, have taken into partnership Mr. Edward Hooper, C. and M. E., who has been in charge of active mining operations in Nevada for a few years past. Mr. Hooper is a former pupil of one of the firm and has had several years' practical experience in managing and reporting on gold and silver mines in this country; he has also been a student at Freiberg University. He will reside in San Francisco, and it is believed this arrangement will be very advantageous for companies and individuals in England who require reports on mines on the Pacific Coast and Mexico, saving the cost and loss of time entailed by sending an engineer specially from England.

The Horn Silver mine, Utah, has struck a low grade of ore that bothers greatly to handle because of the high percentage of zinc and sulphur.

The Low Tariff on Lead.

Representatives of the smelting interests have appeared before the Congressional Committee and tried to make it appear that the lead-mining industries will be better subserved by lowering the proposed rate of duty of 1½ cents per pound on foreign lead, or of a free admission of lead in ores. This is all very well if it is intended to enrich a few people in a few localities, but if the mass of the people is to be considered the abolition or lowering of the duty would work great harm. North and west of the Rocky mountains investments in property valued at millions would be practically wiped out by free lead ores.

The smelting men assert that they must have Mexican lead ores, because the United States cannot produce a sufficient amount of wet ores or fluxing ores wherewith to smelt the dry ores, and that it is necessary to enter the Mexican market to procure the necessary fluxing ores to continue smelting operations in this country. This is all nonsense. The lead mines of Utah, Montana, Idaho, Colorado and Nevada can furnish all the lead-silver ore necessary for fluxing purposes. In truth, the lead-mining interests of this country are being vigorously assailed by those corporations which want cheaper lead ores. It is necessary for the lead miners to stand together in this emergency and combat the misstatements with the facts. The mining men of Utah and Montana have associations which are moving in the matter, but they have a hard fight to make, as the Kansas smelting men are doing their best to win.

Stewart's Mining Bill.

In this number of the PRESS we conclude a well-written and comprehensive review of the proposed mining law introduced in Congress by Senator Stewart. Our correspondent calls forcible attention to the defects of the proposed measure and the probable results of the enactment of such a law. The writer is a bonafide prospector and miner with practical experience in the work of the present laws, and is one who has given considerable attention to this subject generally.

It is to be regretted that, after Senator Stewart asked for suggestions from practical miners, he adopted none of them at all, but introduces his bill unchanged after defects have been pointed out. As that gentleman is supposed by his colleagues to thoroughly understand the wants of the miners, he has great influence. This being the case, he should have been careful to consider the proposed law in all its bearings and paid some heed to the practical suggestions made to him.

It is probable that the clauses which affect the drift-mining interests of California will be modified since the attention of other Senators and Representatives has been called to the matter. As introduced, the bill is a serious menace to these special interests, as has been pointed out in the PRESS. With reference to the quartz industry, our correspondent pretty thoroughly ventilates the bad features of the law. The letters in the PRESS of this and last week should be carefully read by miners, and they should exert what influence they can to bring to Senator Stewart's attention the defects in his proposed measure.

THE MOLDERS' STRIKE.—There have been no important developments this week in connection with the molders' strike. The foundry proprietors are confident of ultimate success. A few non-Union molders are added from time to time to those already at work in the foundries. Orders for castings have been sent East, which work would ordinarily be done here. The Risdon Works have the largest number of molders at work and are supplying other shops, but the manufacturers state they will soon have men for all, without taking any belonging to the local Union.

MECHANICS' FAIR.—The Mechanics' Fair agent reports that owing to the strike among the iron-molders, the manufacturers would make no definite promises regarding exhibitions, but said that they would make as good a showing as possible. Applications for space for exhibits in other departments are coming in fast, and a successful exposition is assured.

A NUMBER of prospectors have been forcibly ejected from the Navajo Reservation by the Indians and the United States troops.

A New Centrifugal Quartz-Mill.

(Concluded from page 229.)

as so as to turn upon their shafts. The faces of these rollers and their shoes stand parallel with the inner faces of the ring-die, so that when they are driven around by the movement of the carrier they will roll against the die. The sides traveling in the radial guides, allow the rollers to move to and from the center, and thus accommodate themselves to the character and quantity of the material which may lie between them and the die, where the grinding of the ore takes place. The construction of the machine is such that the bottoms of the rollers are kept out of contact with the surface beneath. The rollers are also prevented from being forced upward on the shafts by their movement in traveling around in contact with the die.

From the lower part of the central tank or reservoir (which is supplied with water by a hose), inclined tubes extend outwardly toward the upper end of each of the roller shafts. These shafts are made hollow and the tubes have their outer ends bent so as to enter the hollow shafts. The water thus passes below the slides and serves to wash out any grit or dirt and to act as a lubricant. Other passages extend down from the tank so that water can get down around the shaft-casing and beneath the bottom of the carrier between it and the inclined bottom of the pan, and flowing constantly outward prevents any accumulation of material which might cause undue friction.

A series of inclined plates fixed to the outer edges of the carrier travel along the bottom of the pan between the rollers, constantly lifting the pulp or ore into position to be ground between rollers and die.

By placing the roller at an incline, the centrifugal force caused by the rotation of the carrier throws them outwardly against the die, and by reason of the inclination at which they stand, they are held more firmly in contact with the die by a certain amount of gravitation due to their inclined position, and the tendency to remain in contact with the die prevents their being thrown inwardly and forced away from the die, whenever any material which is larger or harder than usual comes between them and the die. The crushing is thus steadily carried on, and there is no tendency of the rollers to bounce away from the die as they travel over it. The machine is low and compact and easily separated into comparatively small portions for shipment.

Both weight of rolls and centrifugal force combine to crush the ore. The parts of the mill are easily accessible, and it is readily cleaned up. The large screen surface gives a free discharge.

In addition to the plates below the mill there is a "slammer" or concentrator, shown in the cut. This is so arranged that by means of gates more or less of the gangue can be drawn off, leaving less work for the concentrators afterward and thus requiring less concentrating machines. This "slammer" vibrates rapidly, power being derived from the same source that drives the mill proper. At the head of the slammer the ore drops into a receptacle, filled with mercury. This is as long as the tray, eight inches wide and half an inch deep. Any amalgam is caught and held by this quicksilver.

One of these mills weighs about five tons and costs \$1500. The slammer and ore-feeder cost \$300 more, or \$1800 in all ready for the belt. Mr. Hinkle says that a five-foot mill will crush from 15 to 20 tons of hard ore per day or 25 to 40 tons of soft ore through a 40-mesh screen. H. P. Gregory & Co. are the agents for this coast. This mill is very useful in testing or prospecting mines, since, in case of necessity, it is easily moved to a new location, which is not the case with a stamp-mill.

THE MINING BUREAU WORK.—At the meeting of the directors of the State Mining Bureau on Monday, State Mineralogist's Ireland's appointments of Messrs. Miner, McGregor, Angel, Goldstone and Hobson, as field deputies to further the work of making a geological survey of the State, were confirmed. There are now nine deputies at work on the survey, for which the last Legislature appropriated \$35,000.

It is stated that a 30 foot vein of good coal has been opened 16 miles from The Dalles, Oregon, and a company has been formed to work it.

(Concluded from page 231.)

Fol. 105; . . . "That the channels were filled by the rivers themselves seems to be clearly disproved by the fact that gold is distributed throughout the whole mass, from bedrock to surface, by the sharp angular sands, and by the coated gold. Water must have flowed in the ancient rivers comparatively free from obstruction for a long period before the deposition of the gravels to admit

If bowlders were formed by river action, as believed by many writers, they would be only

says the rivers extended many hundred miles beyond), would attain an altitude of 21,500 feet. At Portwine, in Sierra county, some channels have a grade of 200 feet to the mile. Such a river commencing at that point and extending 500 miles at the same inclination, would head at an altitude of 105,000 feet above sea level. It would be vain to object that geological changes may have made the grade

Fol. 109: "Mameluke hill, near Georgetown. I esaid to cover a basin in the bedrock, the rim on all sides being higher than the central portion capped with volcanic cement. The gold is smooth-washed, coarse and heavy."

INFRINGEMENT OF A PATENT.—Peter H. Jackson has brought a suit in the United States Circuit Court against George D. Nagle for infringing on a patent for illuminating basements. Jackson says that he is the inventor of a certain method of inserting heavy pieces of glass in iron in sidewalks in such a manner as to admit light below and not interfere with pedestrians, and that Nagle is infringing on his patent. Jackson asks that he be enjoined and made to account for all profits on the sales he has made.

F. E. CHAPPELET has been appointed president of the Mayflower Gravel Mining Company in place of Henry Barroilhet, resigned. The Bank of California has also been appointed treasurer of the company instead of Bello Freres.

Fig. 1—DEAL VIEW OF AN ANCIENT LAKE.—See page 231.

FIG. 2.—THE LAKE BED COVERED BY EARTHY ERUPTIVE MATTER

The same river that conveyed and deposited the bowlders 20 tons in weight, could not have subsequently filled the interstices with the finest of silt as described by Dr. Trask, Prof. Blake, and other writers, which did not mar the perfection of the most fragile imbedded leaves.

The grade assumed by Mr. Hittell (33 feet to the mile), commencing at an altitude of 5000 feet and continuing for 500 miles (Mr. Hittell

seem greater than it was, for without a heavy
grade all river arguments fall to the ground,
nor can it be maintained that a river, dead or
otherwise, four miles wide as claimed by Dr.
Trask, could transport the immense boulders
described and place them as stated. It is well
known that modern subglacial streams have
generally a similar grade, yet they are all loose
and owe their birth to the melting ice. Those
of the great Muir glacier, described by Prof.

Fig. 3.—RESULT OF GEOLOGICAL CHANGES PRODUCING PRESENT CONDITIONS

The Astronomical Society.

The annual meeting of the Astronomical Society of the Pacific was held on Saturday evening last. Prof. E. S. Holden presided. As the retiring president he submitted a report on the work done at the Mt. Hamilton Observatory. He said that there were not sufficient accommodations at the observatory for the scientists stationed there, and complained that during the winter they were put to extremities to keep warm.

Prof. Schaeberle of the Lick Observatory gave a most interesting account of his trip to South America to view the total solar eclipse on Dec. 21, 1889. He told about the customs of the people of the island of Cayenne, and views of the people and country were thrown upon a screen. Photographic views of the eclipse were also shown.

The president appointed W. M. Pierson, F. H. Haumann and J. J. Jones a committee to inquire into the proposition of establishing an observatory in the city, as suggested by one of the members.

The annual election for directors resulted in the choice of the following gentlemen: E. S. Holden, Frank Soule, J. M. Schaeberle, Chas. Borchhalter, William M. Pierson, C. B. Hill, J. H. Wythe and F. R. Ziel, Publication Committee—E. S. Holden, J. E. Keeler and C. G. Yale (of the MINING AND SCIENTIFIC PRESS). The directors elected the following officers: President, E. S. Holden; vice-presidents, W. M. Pierson, Frank Soule and J. H. Wythe; secretaries, J. M. Schaeberle and Chas. Borchhalter; treasurer, E. J. Molena.

The following new members were elected: H. C. Lion, H. M. Hickox, Mrs. H. A. Harlaod, H. T. Bestoe and Harry Darbrow of San Francisco; George Gleason of Berkeley, A. W. Craig of Oakland, Miss M. E. Chaso of Santa Rosa, Mrs. Harriet Wright of Denver, Col.; Andrew Greig of Tayport, Scotland; Herbert Ladler, F. R. A. S., of London, Eng.; W. H. Maw, F. R. A. S., of London; John Tebbutt, F. R. A. S., of Windsor, New South Wales; Ewell Davidson of Branscombe, Queensland; A. Stanley Williams, F. R. A. S., of Brighton, England; O. A. H. Pihl of Christiania, Norway; and Miss Dorothea Klawke of Paris, France.

Assessment Notices.

ACME MILL AND MINING COMPANY; location of principal place of business, San Francisco, California. Location of Works, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1890, an assessment, No. 10, of 3 cents per share, was levied upon the Capital Stock of the Corporation, payable immediately to United States Gold Coin to the Secretary, at the office of the company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of May, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, THE 9th DAY OF JUNE, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. M. BUFFINGTON, Secretary.
Office, Room 11, No. 303 California Street, San Francisco, California.

DIVIDEND NOTICE.

OFFICE OF THE PACIFIC BORAX, SALT AND Soda Company, San Francisco, March 31, 1890. At a meeting of the Board of Directors of the abovesaid Company, held this day, a Dividend (No. 30) of One Dollar (\$1.00) per share was declared, payable THURSDAY, April 10, 1890, at the office of the Company, No. 230 Montgomery Street, Rooms 11 and 12. Transfer Books close April 6, 1890, at 3 o'clock p. m.

ALTON H. CLOUGH, Secretary.

Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hardy-gurds, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, 25¢, post-paid. For sale by Dewey & Co., Publishers, 220 Market St., San Francisco.

Dewey & Co.'s Scientific Press
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our fees are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Paul's Dry Amalgamating Barrel Process.

The undersigned is prepared to erect, or furnish drafts for erecting, machinery, also instructions for working ore by the new patented DRY AMALGAMATING BARREL PROCESS. I assert the ability to overcome EVERY difficulty connected with amalgamating the precious metals, more especially gold, and to add from 25 to 100 per cent to the FREE GOLD yield of any mill working WET. Being the original inventor of dry amalgamation, I have spent over 20 years perfecting the system, now brought to a wonderfully efficient, inexpensive and practical one. I caution all parties against imitations. For further particulars, address
ALMARIN B. PAUL,
Middle Creek P. O., Shasta County, California.

Smelter For Sale or Exchange.

One 50-ton, wrought iron, water-jacket Smelting Furnace (38"x56" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 28, Elkhorn, Montana.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MARCH 25, 1890.

 17,709. — TRADE MARK — H. W. McIntyre, Vina, Cal.

The following brief list by telegraph, for April 1, will appear more complete on receipt of mail advices:

California — George A. and C. F. Fleming and G. T. McLaughlin, San Jose, fruit-picking and spreading machine; Edward S. Geron, Lafayette, assignor of half interest to J. Eva, S. F., reversible plow; Elam Harter, San Diego, step-ladder; John L. Heald, Crockett, steam boiler; John Hellrath, Plymouth, two-wheeled vehicle; same, adjustable vehicle seat; Ernest L. Ransome, S. F., mold for molding concrete continuously; Daniel S. Reagan, S. F., gas engine; John C. H. Stut, S. F., automatic cable lifter for cable railway; same, automatic tension device for cable railway; Lewis A. Turner, assignor of half interest to W. D. Bahcock, Los Angeles, rail climber for vehicle wheels; Louis Zander, Oakland, lamp-burner.

NOTE. — Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

COOLER. — Albert McDowell, Selma, Fresno Co., assignor of one-half to J. A. Stroud. No. 424,125. Dated March 25, 1890. This is one of that class of coolers in which the evaporation of water is made to rapidly take place by exposing a considerable surface of saturated fabric whereby the temperature within the cooling vessel is lowered. The invention consists in a suitable vessel for the water, having within it a vessel for the material which is to be kept cool, covers of fabric or other suitable absorbent material fitted to the outside of the water vessel and having end flaps rolling over the edge of said vessel into the water, rolls of absorbent material or fabric passed around the exterior of the vessel and having extension flaps projecting into the water, an outer belt or hand fitted around the vessel outside the rolls, whereby an air space is formed between said belt or hand and the vessel, a suitable roof or top for the vessel with absorbent coverings, and certain minor details of construction and arrangement.

FRUIT GRADER. — David D. Jones, Santa Clara. No. 424,002. Dated March 25, 1890. This is one of that class of machines for separating fruit according to sizes and usually known as fruit-graders. The fruit is placed in a box at the head of the machine and falling upon an inclined grated surface rolls down toward the lower end, and in passing over said surface, fruit below a certain size drops through the spaces between the bars of the grated surface and through between the slats of the rack below and upon the inclined bottom of the box and is discharged into a suitable receptacle. The fruit above a certain size failing to pass through the grated surface, passes down over the end and is received in a suitable receptacle. When any of the fruit sticks or clogs between the bars of the grated surface, the rack below is raised up so that its slats come up between the bars of the grated surface and thereby free the fruit whenever it is necessary. The spaces between the slats are wider than those between the bars and the former therefore present no obstruction to the passage of the fruit.

UMBRELLA ATTACHMENT. — Marcus Dattlebaum, S. F. No. 423,990. Dated March 25, 1890. This invention consists essentially in a receptacle adapted to be readily attached to and detached from the pointer end of the umbrella stick, whereby when the umbrella is closed the water running from it shall drip into the receptacle. The drip falling into this

little detachable cup or attachment is prevented from soiling the carpet or other surface upon which the umbrella is placed. The little cup or bulb is preferably made of rubber, and is carried about in the pocket. After it has been in use it is removed from the umbrella, inverted, and the collected water poured out. Being a rubber bulb, the water is easily squeezed out.

MACHINE FOR SHARPENING CUTTING TOOLS. — Albert Richardson, S. F. No. 424,025. Dated March 25, 1890. This invention relates to a machine designed to sharpen files, saws, and all that class of tools which have irregular cutting edges, such as cannot ordinarily be sharpened except by the use of a file or similar tool. The inventor takes thin disks of paper, pasteboard, wood-pulp fiber, or other easily cut material, and coats one or both surfaces with a preparation of corundum, emery or other hard fine grit or powder, which is mixed with a proper cement which will bind it firmly to the disk. The disks are made of any suitable size, depending on the size of the teeth to be cut. For sharpening a saw the disks are thicker and separated a greater distance than for files. The disks are mounted on a spindle and are revolved rapidly. The cutting is done by the hard powder which forms the surface of the disks, and which is sufficiently hard to cut a file or any tool of steel without drawing the temper. The paper or soft material wears away gradually so as to keep a perfectly sharp edge upon the emery disks until they are entirely worn away, the paper serving simply to support a coating of emery which would be too thin to support itself and do the work required. The disks may be mounted in gangs and be driven in any suitable way.

ICE MACHINE. — John O. Kitton, S. F. assignor of one-half to Wm. T. Garratt & Co. No. 424,005. Dated March 25, 1890. This improvement in ice machines consists of a series of vertically disposed freezing channels within a tank having insulating chambers within which the freezing medium is circulated around these freezing spaces, and in combination therewith of a series of vertically-arranged transverse sliding boxes or hollow removable partitions, which are dropped into the aforesaid channels to provide end-spaces, through which the freezing medium is circulated, so that refrigeration is carried on at points intermediate in the length of the chambers as well as at the sides. These supplemental removable transverse freezing-chambers or partitions may be employed in connection with other forms of what are known as "can" or "plate" machines, the object being to apply the freezing medium at the ends as well as the sides of the water-containing chambers and also at a number of intermediate points in the length of the chambers to increase the freezing capacity.

STEAM-MOTOR FOR PUMPS. — Henry O. Beatty, Sacramento. No. 424,045. Dated March 25, 1890. The object of this invention is to simplify the construction of that class of steam-motors or engines exemplified by Patent No. 408,400 issued to the same inventor August 6, 1889.

BALINO PRESS. — Walter Bullard, Chico, Butte Co. No. 424,046. Dated March 25, 1890. The object of this invention is to provide a compact, effective and rapidly operating press. The patent covers several constructions, arrangements and combinations of parts.

FENDER FOR FEED-TROUGHS. — Hans Nisson, Sacramento. No. 424,020. Dated March 25, 1890. The invention relates to the class of feed-troughs which are provided with adjustable gates or fenders, the purpose of which is to prevent or allow access to the trough as may be desired. A series of bent brackets are hinged to posts and the central portions of these brackets connected together by plate or wire. When access is to be had to the trough, the brackets are turned simultaneously by a lever so as to carry the rails or wires parallel with the trough, affording perfect access to it. By swinging the brackets back again the wires or rails are put in such a position that stock cannot get access to the trough.

MINERAL DISCOVERIES. — Reports of rich mineral discoveries in the Carrizo mountains, on the Navajo Indian Reservation, in North-eastern Arizona, have resulted in the organization of several parties of prospectors in Arizona and New Mexico, who have gone to locate claims. The Government, as well as the Indians, are opposed to the prospectors entering the reservation, and the result of this expedition is watched for with much anxiety. The Carrizo mountains are 125 miles north of Gallup, on the Atlantic & Pacific railroad.

A COMPANY entitled the Patriot Silver Mining and Milling Co. has been incorporated under the laws of Nevada to work the Patriot mine in Yankee Blade district, Lincoln county, leased from the Manhattan Co. for a period of two years, giving that company a royalty of ten per cent on all ore extracted.

THE Yuma Sentinel says a large deposit of rock salt has been found in Silver District, Arizona, three miles from the Colorado river.

IRVING M. SCOTT of the Union Iron Works has returned to San Francisco from Washington,

Coast Industrial Notes.

The new foundry at Astoria started up on March 16th and turned out 240 window-sash weights.

THE Yuma Sentinel says that county has several deposits of antimony that could be worked with profit.

THERE is a great demand for lumber vessels at all Puget Sound lumber-mills. Coasting vessels have gone on deep water, and freights have advanced from \$4.50 to \$5.50 a thousand feet.

GROUND was to be broken last week at the corner of Thirteenth and Franklin streets, Oakland, for the electric street-railway of the Oakland and Berkeley Rapid Transit Company.

A FACTORY for condensing milk and coffee has been built at Buena Park, five miles from Anaheim, Los Angeles county. It was started up for business last Wednesday and was inspected by many visitors. When in full operation it will use the milk of 3500 cows every day. The plant cost \$20,000.

THE reason attributed for the non-arrival of foreign coal is that until a short time ago there were very few deep-water vessels leaving port for England or Australia. A great many wheat-laden vessels have left here, however, within the past month, and there is a great number now in port loading for Europe, many of which will return here with coal.

THE fruit and vegetable commission merchants doing business in this city have begun a movement to shorten their business hours. It has been a custom for many years to open the stores in that line of business at 2 and 3 o'clock in the morning. As there appears to be no reason why these unearthly hours should be observed, it is now proposed to open at 5 A. M. Many of the leading merchants are in favor of the change.

MR. McKENNA introduced a bill in the House to provide a station for silk culture in the State of California. It provides that the Secretary of Agriculture shall purchase not less than thirty nor more than forty acres in the State, of which fifteen shall be planted in mulberry trees and the land shall be used to cultivate young mulberry leaves, and to provide silkworm eggs and cocoons for distribution. There is to be one superintendent at \$2000 and an assistant superintendent at \$1800 per annum, and the sum of \$30,000 is provided for the expense of the farm for the first fiscal year.

T. B. McGOVERN, representing large Chicago and New York houses which make a specialty of handling canned salmon, is in Portland, Oregon. He has placed orders here for years past for from 30,000 to 50,000 cases of Columbia river salmon, but will not try to do business with the Columbia river cannerymen this season. He says the tendency all along the line is for lower prices, and British Columbia salmon is now quoted in the English market on an equality with standard brands of Columbia river salmon, and cannerymen there realized the condition of affairs on the Columbia river, and being able to get raw fish almost as cheap as in Alaska, intend forcing the business, and a number of new plants will be put in operation. The ideas of the trade generally as to prices range from \$1 for Alaska to \$1.25 for Columbia river brands, and at the prices fishermen on the Columbia river are demanding for raw fish it is utterly impracticable for cannerymen to do business.

THE officials of the North Beach & Mission Railway Company state that the road will soon be changed into a cable line. It is expected the change will be made during the early part of the coming summer, draymen being already engaged on the plane. The line will extend ten miles, starting at Townsend street and running along Fourth to Market, across Market to Stockton, to Geary, down Geary to Kearny, to Broadway, to Powell, to Montgomery avenue, along the latter thoroughfare to Mason, and on Mason to the bay. The other route will extend the entire length of Foley street, from its commencement to East street, and along East street to the ferries. Then it will run up Market street to California street, on California to Kearny, on Kearny to Market, on Market to Eighth, and on Eighth to Folson. The old headquarters at Fourth and Louisa streets will be torn down and a great power-house erected. It will be as large as any in the city, and will have none but the finest machinery.

"WANTED" — 2000 men to work on railroad. Pay, \$2 to \$2.50 per day. This sign in large letters was placed in the window of the steamship and railroad ticket office, corner of Montgomery avenue and Vallejo street, and was displayed on the bulletin-board of a Clay-street employment office, one day last week. It is a genuine offer for laborers, and yet there was no great demand from the unemployed during the day, because it would cost each man about \$12 or \$15 before he could reach his work. The order is from the Portland contractor of the Union Pacific railroad, who want 1500 able-bodied men for Oregon and 500 for Utah to work on the U. P. extension. About 100 men, mostly Italians, have already been engaged in this city. The men will be required to pay \$2 office fee for securing the job, \$3 on the steamer and 1 cent per mile on the railroad from Portland to point of destination. They must have blankets. Board will cost them \$5 a week, and the job will last all summer. Common laborers will get \$2 a day, "rook men," or those driving dumpcarts, \$2.25 a day, and "headers for tunnel work," or those shoveling and picking in tunnels, \$2.50 a day,

Sampling Ores.

We should be obliged to our esteemed contemporary, the Virginia Enterprise, if when it considers it necessary to criticize any statements made by the MINING AND SCIENTIFIC PRESS, it would first make sure that it is crediting its "clipping" to the right journal. The Enterprise reads the PRESS a lecture for casting reflections on the milling and mining management of the Comstock, in saying: "The Golden Chariot is the only mine on the Comstock that returns the average value of its ore as per car sample."

THE PRESS never made any such statement, nor did any of its correspondents. So the little "fing" of the Enterprise about having to teach writers on mining papers how to write up mining information, is not quite to the point. Our contemporary has probably taken it from some other paper and credited it to the MINING AND SCIENTIFIC PRESS.

We have had no articles of late on the subject of sampling ores, except one on "Car and Battery Assays," emanating in the form of a general letter or circular, from the officers of the Mining Stock Association of this city. That circular was reprinted and duly credited to its source, so that the Enterprise could scarcely hold the PRESS responsible for anything therein contained. The argument of the Mining Stock Association was for the publication of both car and battery assays in the interest of the speculative public, and the management of the Overman Mining Company was commended for making a new departure in giving in its report the figures of both car and battery assays.

THE PRESS published this as it would any other news connected with mining matters, with no additions or comments, simply stating in a prefatory sentence that the "following letter was written by the officers of the Mining Stock Association." On this claim basis, for we can think of no other, the Enterprise builds its article. No writer on this paper had anything to do with originating the circular or letter; and no such statement as the Enterprise credits us with was ever published in the MINING AND SCIENTIFIC PRESS.

From Johannesburg.

William Munro, who left the Comstock last summer for the South African gold-fields, has written a letter to a friend in Virginia, descriptive of his trip and of the country in which he is at present working.

MR. Munro embellishes his facts with but few adjectives, and tells a tale that knocks more romance out of South Africa in a minute than the English packet lines and mining shareholders can plant in a year.

Following are sentences reproduced from his letter verbatim:

"I have not seen a person since I left Virginia that I ever saw before. One vessel called at Flushing, Canary Islands and at St. Helena. The latter is the most miserable place I ever saw. I didn't have time to visit Napoleon's grave. I am very much disappointed with Johannesburg. Why people write such glowing falsehoods about this place I cannot understand. There is a great large town built all over the country, and it is full of people trying to live off their wife. The mines are all incorporated, and many of them have sold for high figures, but now they are very low, and many who have made money here are now losing it. Not one-half of the mines pay half the expense of working them. Their stock is unassessable, and when a company is out of money they lease new stock for working capital. Most of the rock is very low grade, and they can save but a small percentage of the gold in it. Living is very high and very poor. Wages are low. Natives do the work, directed by the whites. There is a great deal of typhoid fever. The water is not fit to drink. It looks like milk after a shower, and remains muddy two or three days. We have terrific sandstorms, when we cannot see five feet ahead. A great many people die here of inflammation of the lungs, brought on by the inhalation of sand. Coming here, I met at least 300 men returning to the railroad. They could find nothing to do. The ground is staked off for miles in every direction. I am working in a mine, and if my health keeps good until I make enough to take me out of here I will be happy. They have schemes to get money out of you here that I never heard of before. You may think I have drawn a dark picture of this place, but I have not pictured it half as bad as it is. Those who do not believe me had better come and see."

DURING the past year there were hoisted from the Hale & Norcross mine 27,962 tons of ore and 43,100 tons of waste, and have run 4637 feet of drifts. The gross bullion yield of the ore milled was \$519,117.58.

NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES

For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER
AT REDUCED PRICES.

THE ROLLER ORE FEEDER

(Patented May 23, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,
And will furnish descriptive Catalogues and quote prices upon application.

DEWEY & CO. { 220 MARKET ST. S. F. } PATENT AGENTS.
Elevator, 12 Front

FRANCIS SMITH & CO.

Manufacturers of

Sheet Iron and Steel PIPE!

ALL SIZES.

130 Beale Street, San Francisco, Cal.

Iron cut, punched and formed, for making pipe on ground. All kinds of Tools supplied for making Pipe. Estimates given. Are prepared for coating all sizes of Pipe with a composition of Coal Tar and Asphaltum.

The Best Mining District On the Pacific Coast! GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is
THE TIDINGS.

Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe. Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.

DAILY, \$6 00 a year; WEEKLY, \$2 50, in advance.
H. S. SPAULDING, Publisher.
T. C. HOCKING, Editor.

Great Variety of SHOT GUNS, RIFLES,
etc. Breech-Loaders from \$4 to \$100.

SEND STAMPS FOR PRICE LISTS.

GEO. W. SHREVE,

GRANGER'S ROLLER STAMP MILL

Beats them all. Works dry ores. Makes even granulation. No dead work, hence minimum wear.

A. P. GRANGER, Denver, Colo.

GRANGER'S DRY ORE SEPARATOR

The very best. Uses no water. No freezing up. Saves hauling waste. Saves high percentage. Send for circulars.

A. P. GRANGER, Denver, Colo.

FOR SALE.

One Ohmen's 12x12 Automatic Engine; best style in use. Also, 1 Boiler 48 in x 13 ft. Both nearly new. Apply to J. W. QUICK, 221 First St., (Top Floor) San Francisco, Cal.

AMALGAMATING MACHINERY.

Stamp Mills for Wet or Dry Crushing. Huntington Centrifugal Quartz Mill. Drying Cylinders. Amalgamating Pans, Settlers, Agitators and Concentrators. Retorts, Bullion and Ingot Moulds, Conveyors, Elevators, Bruckners and Howell's Improved White's Roasting Furnaces, Etc.

FRASER & CHALMERS, MINING MACHINERY

CONCENTRATING MACHINERY.

Blake, Dodge and Comet Crushers, Cornish Crushing and Finishing Rolls, Hartz Plunger and Collom Jigs. Frue Vanner & Embrey Concentrators, Evans', Calumet, Collom's and Rittenger's Slime Tables. Trommels, Wire Cloth and Punched Plates. Ore Sample Grinders and Heberle Mills.

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery. Adapted to heads running from 20 up to 2,000 feet. From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER WHEEL MOTORS.

Varying from the fraction of 1 hp to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO.,
Springfield, Ohio, or 110 Liberty St., New York.

HOT and COLD BATHS FREE.

Terms, Board and Room, \$1.00 per Day
And Upward.

Rooms with or without Board.

Free Coach to the House

J. POOLEY.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, April 3, 1890.

General trade continues free, with the volume of goods going out in excess of that at this time last year. Although the past winter was the most severe the merchants, manufacturers and business men in general have passed through for several years past, yet the failures reported were light, while the future betokens a very promising year.

The iron-molders' strike is still on, but foundrymen are determined to hold out to the end. Each day adds one or more iron-molders to the force they have employed.

The money market is quite easy. The quarterly dividend and interest disbursements are very heavy, which tends to ease the market, as does the transfer of the Nevada Bank into the control of other parties. The money that has been tied up can now be placed, while the new subscribed capital of \$3,000,000 can be put on interest. The retention of Mr. Davidson as cashier gives satisfaction to all who have dealings with the bank. The officers and directors are leading representative business men, which insures to the institution a good business and a first-class standing.

Remittances from the interior are free. The City Treasurer's disbursement in March aggregated nearly a quarter of a million dollars, and the money still on hand on April 1st aggregated nearly \$1,700,000.

MEXICAN DOLLARS—The market continues dull at 75¢@75½ cents. Importations are light.

SILVER—Receipts continue light, not meeting the Mint's wants. Exporters are still out of the market. This is partly due to the low rate of sterling exchanges. As India's cereal crop will begin to move soon, it is not at all unlikely the export movement will start up within the next 30 or 40 days. The markets abroad and at the East have gained in strength under fairly light supplies and a good, steady demand. Silver is favorably influenced by the action of Congress toward the metal. The opinion is gaining ground that at this session of Congress a bill will be passed which will soon bring silver up to par. So far as we can ascertain, the belief obtains that the Windom bill as amended will be the one.

The local market for silver has held steady at 95.25 cents Mint prices. The Mint bought this week 97,000 ounces. A sale of 30,000 ounces was made direct to-day to the Department at Washington at a slight advance on Mint prices here. This indicates that the price will be soon advanced here.

London cables received to-day quote silver unchanged.

QUICKSILVER—The market continues to rule very strong under a good home demand and a fair export inquiry. The Comstock mines have bought very freely. The mines (deep and gravel) in this State and up north are beginning to buy more as transportation improves. Receipts the past week aggregate 94 flasks, and exports by sea one flask to Victoria.

BORAX—Receipts the past week aggregate 212 ctns., and exports by sea 115 lbs. to Honolulu. The market is not quite so strong.

LIME—Receipts the past week aggregate 5674 bbls., and exports by sea 373 bbls. to Honolulu. There is a continued increased consumption, due to more buildings and other improvements under way.

TIN—Exports by sea the past week aggregate 6088 pounds to Victoria. The local market for both pig and plate shows no material change deserving of particular mention. Foreign advices, generally, have an easier tone.

COPPER—From the best obtainable information, the markets at home and abroad are gradually working into better position for the selling interest. The consumption is steadily increasing, while the output of the mines as yet shows no material increase.

IRON—The market continues sluggish, but so far as we can learn, there is no disposition to press sales. With more iron-molders given employment, the consumption of iron will steadily increase. Foundrymen are confident of being able to secure in time all the iron-molders wanted, and at their own terms, too.

COAL—Imports the past week aggregate as follows: From Tacoma, 2750 tons; Coos Bay, 1860; Seattle, 3670; Departure bay, 3735; Comox, 4300; Nanaimo, 4300. Total, 19,616 tons. The market holds strong for Australian and Wellington, and fairly firm for other brands. The offerings of Australian continue light. For a cargo of Grete, \$7.25 was freely bid but refused. As our wheat crop promises to be very large and the tonnage on the way is light, there may be, later on, more vessels listed from Australia so as to take advantage of any advance in freight for next season's business. Of course this will develop itself later on.

Eastern Metal Markets.

By Telegraph.

NEW YORK, April 3, 1890.—The following are the closing prices the past week:

	Silver in	Silver in	Lead.	Tin.
Thursday....	43 13-16	95	\$14 30	\$3 90
Friday.....	43 13-16	95	14 30	3 90
Saturday....	43 13-16	95	14 30	3 90
Sunday.....	43 13-16	95	14 30	3 90
Monday.....	43 13-16	95	14 30	3 90
Tuesday....	43 13-16	95	14 30	3 90
Wednesday..	43 13-16	95	14 30	3 90

NEW YORK, April 2.—Borax was more plentiful, Lower California refined, 9½¢. Quicksilver nominal at 69¢@70¢. In copper there is a Boston rumor of large sales at 14¢, but here 14½¢ is a rejected bid; 14½¢ asked for casting brands; quoted steady at 12½¢@13¢. Pig lead is slow and easier, 33.90 bid a single car.

FLOUR is \$4 a hundred pounds at Sierra City, and the Sierra Buttes Mining Company has quit selling.

Mining Share Market.

The past week has witnessed more general activity in the Comstock mining shares than since April of 1889. The activity has a far different appearance from that of a year ago, for seemingly it has the elements of a market based on important work in the mines and stocks being well concentrated. The leaders the past week were Coblar and Potosi, which made a decided advance, causing many shorts to fill, after which, under manipulation, a bear raid was made, sending the prices down from 20 to 35 per cent; but toward the close of the informal session this morning the market gave signs of turning for the better. In the outside stocks there was very little done; the attention of the public is drawn to the Comstocks.

Opbir was assessed 50 cents a share the past week, while Con. Virginia declared a dividend of 25 cents per share.

The street is filled with rumors of all kinds—made to fit any particular case.

The most important information received this week from Virginia City is that an agreement has been arrived at for reducing the water charges, transportation charges, Suto tunnel royalty and milling. The general reduction averages about 50 per cent.

From the Comstock mines, reliable private advices continue hard to get, but all to hand are confirmatory of previously received information. In the upraise in Potosi the ledge is about five feet wide, and assays from \$40 to \$70 per ton, although about half of it goes much higher. The winze is being sunk on ore that assays well. Mr. Lyman and W. E. Sbaron, after examining the Potosi and Coblar mines, speak very bigbly of the outlook. The general tenor of their reports is that an important ore body is liable to be uncovered with further work in the two mines. They confirm what has previously appeared in the columns of the MINING AND SCIENTIFIC PRESS.

While attention is drawn to the middle mines, it is well not to overlook the fact that very important work is going on in the North End and Gold Hill mines, which will undoubtedly lead to more general activity in the stocks of these mines. Opbir, Mexican, Union, Sierra Nevada and Utah deserve watching in the North End, as do Overman, Sag. B-lcher, Belcher, Crown Point, Yellow Jacket and Confidence at the South End.

In Alpha and Con. Imperial, good work is being done. The official letter received yesterday (Wednesday) from Overman, reports that in the incline upraise from the 54-foot level they were in 11 feet of ore that assays from \$22 to \$25 a ton. In Crown Point an improvement is reported in the upraise above the 300-foot level, while in the winz below that level they are in one set of timber of good ore (good ore assays from \$30 to \$45 a ton). In Confidence the west crosscut is reported in low-grade ore.

In reply to a subscriber, we will state that Crown Point milled in last month (March) 3500 tons of ore which averaged fully \$17.50 per ton, pulp assay, or a total of \$61,250. This, when reduced to bullion and sold, should give to the company a coin return for the month of not less than \$45,000, and may go over \$50,000. This ought to pay all running expenses, indebtedness, and leave a surplus. The full returns will not come to band until after the statement of April 1st.

A NEW SYSTEM FOR HANGING ELECTRIC WIRES over the streets is proposed by a Milwaukee electrician. A wrought-iron arch will span the street between a wary pair of poles to keep them from curving or breaking, and to prevent the wire from sagging. The orac-wirra will be supported by two properly insulated wires suspended from the arch. Gnard wires will be hung from the arches parallel with and above the traction wires, so that if a telegraph wire happens to break it will not fall on the heavily charged wires.

THE DURABILITY OF YELLOW PINE for flooring, says the Northwest Lumberman, is shown by an instance in which a saw-manufacturing concern five years ago put a long-laaf pine floor in its factory, which is as sound now as when put down, the manager of the concern declaring that if white pine had been used it would not have lasted more than a year on account of the war of constant rolling saws over it, the teeth cutting into the soft wood.

A MULTIPLE COLOR PRESS is successfully used which will print a daily newspaper in a dozen different colors at the rate of 30,000 copies an hour.

Attention, Southern California Miners.**WORKS FOR SALE.**

The Works are situated at Daggett, Cal., in the Calico Mining District, and on the side-track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power Engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to GILLISPY & CHILDS, 123 California St., San Francisco.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write me direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

It is marvelous that the cyclone killed only 100 people in Louisville. Such storms have been more fatal than that in the open country. The city is to be congratulated upon its escape.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1889. This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and contains full facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, cloth, postage free. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEARNING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY & Co., S. F.

AMERICAN MINING AND STOCK CODE**"KELLOGGRAPH."**

Indispensable to the Mining Profession and Useful in all Business Transactions.

A Complete System of Transmittal Telegraphic Messages by Code Cipher Words in a Legible, Secret and Economic Manner.

OVER 35,000 WORDS AND SENTENCES Subject to transmission under infinite complication by the use of over 70,000 code words.

No danger of publicity in telegraphing matters concerning operation or sale of mining property. This work strictly alphabetical and classified. The handiest work ever published for mining operators.

PRICE, \$5. Forwarded postpaid on receipt of price by DEWEY & Co., 220 MARKET STREET, SAN FRANCISCO.

FOR ENGRAVINGS of all kinds, apply to Dewey Engraving Company, No. 220 Market street, San Francisco.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, \$8.00 post-paid. Sold by Dewey & Co., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulae as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 60 cents additional per volume.

VALUABLE BOOKS ON MINERALS, MINING AND ASSAYING.

A Practical Manual of Minerals, Mines and Mining. Comprising suggestions as to the localities and associations of all the Useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analysis of each of those minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL. D. Illustrated by 171 engravings. 8vo, 367 pages. Price.....\$4.50
 A descriptive circular giving the full table of contents of the above book sent free to any one who will send his address.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$900, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 41 additional Frues and more stamps have been purchased. ADAMS & CARTER.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)
Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.
Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

(Signed) Sup't North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased; and twenty-eight (28) are now in constant successful operation.

Rolls For Working Ore.

For concentrating ores for subsequent metallurgical treatment, the crushing, to avoid comminution, which produces slimes, the ores must be disintegrated only to the extent requisite to unlock all the minerals. The coarse crushing of the ore is effected by rock-breakers, two sometimes being used, the second crushing finer than the first. The screenings from the rock-breakers are further comminuted by rolls, which, for this purpose, are preferable to stamps, inasmuch as their use minimizes the amount of slimes incidental to crushing. The degree of the fineness of the crushing will depend on the character of the ore and the system of treatment adopted. There are two sets of rolls—the coarse-crushing rolls and the fine-crushing or “finishing” rolls. The types furnished by the Union Iron Works of this city for concentrating-mills are shown in the accompanying engravings.

The roughing rolls are geared up to get the power for crushing the coarser parts of the rock after it has passed through the rock-breaker. One of the rolls with its gear and pinion is carried on a sliding frame held in position by spiral springs, which in turn press against the cross-head, which is supported by the four heavy bolts that pass over to the opposite roll. The springs allow for any irregularity or hard rock that may get into them. The rolls themselves are supplied with white iron shells held in place by means of a key so they may easily be replaced—or of steel.

All ore that is too coarse to pass through the screen in trommel No. 1 is put through the finishing roll, which reduces it in size sufficiently to pass through the first trommel. Like the roughing roll, one roll is carried on a sliding frame supported at the back by the steel spiral springs as shown resting against the cross-head, and all supported by the four bolts. The rolls have steel shells faced and fitted to place, held by an inside key as in the roughing rolls. There

is a cast-iron hopper with a screen in the top which only admits ore at a certain degree of fineness.

THE PLACER MINES OF MONTANA yielded last year \$285,451, divided between the several counties as follows: Deer Lodge, \$94,930; Jefferson, \$79,421; Madison, \$4100; Meagher, \$58,000; Silver Bow, \$50,000. The average wages paid for work in this industry are \$3.42 per day.

WILD'S PATENT FINISHING ROLLS FOR FINE ORE.

A Novel Application of Water-Power.

One of the best examples of the utilization of waste water that has come under our notice is that recently made at Watsonville, Santa Cruz county, in this State. The Corralitos Water Company get their supply from the Corralitos Creek at a point $7\frac{1}{2}$ miles from the town. Their distributing reservoir is located $1\frac{1}{2}$ miles distant at an elevation of 90 feet. The water is brought from the Corralitos creek, six miles above, in a

15-inch pipe and discharges into the reservoir under a considerable head.

It occurred to the Water Company not long ago that this pressure might be utilized to light the town, and after conference with the Pelton Water Wheel Co., the scheme was found to be perfectly practicable, and a contract was at once entered into with that company to erect the power plant, and with the Thomson-Houston Co. for the electric installation.

The plant consists of a 4-foot Pelton wheel, which runs under a pressure of 60 pounds, equal to a head of 140 feet, the water being discharged on to the wheel through a $2\frac{1}{4}$ inch nozzle. Close regulation is afforded by a deflecting nozzles and hydraulic governor, which gives perfect steadiness to the lights. The dynamo is a T. & H. alternating current which runs 300 16 C. P. incandescent lights, the current being carried to the town, $1\frac{1}{2}$ miles distant.

The power thus furnished, it will be seen, is from the waste water that has been absolutely valueless, and is so much clear gain to the company, the cost of operating the plant being almost nominal. The water after leaving the wheels falls into the reservoir, having been aerated and freshened to as great an extent as though it had been dashed over a cataract, thus incidentally accomplishing without expense what is so much needed in such cases.

This plant has been in successful operation some three months, and it is now proposed to put in an ice-machine and thus utilize the power wasted during the day. There are probably hundreds of places all over the country where this same experiment can be repeated with corresponding results.

A REAL mining boom is reported at Pioche. In five years nineteen millions of dollars were taken out of the mines. Recently the property has passed into other hands, and the new owners are reopening the mines with good prospects.

WILD'S ROUGHING ROLLS FOR ORE.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—*Eds.*

Angels, Calaveras County.

A Description of the Caved Mine.

[From Our Own Correspondent.]

Angels, like all other mining camps in the State, has seen the loser this winter in the battle with the elements. At the present time an excess of water in the workings and the next to impassable condition of the roads, has caused the most of the mines to close down. Once the weather becomes settled, operations will be resumed on a more extensive scale than in the past season; large mills and additional chlorination works will be erected, and Angels continue to forge ahead.

The Utica.

This mine is the property of Messrs. Hayward, Hobart & Lane, with Mr. C. D. Lane as superintendent, and Mr. C. A. Lillie foreman. Messrs. Lane & Lillie are both old and practical miners. The fine 60 stamp mill with its 24 fine concentrators, the hoists, complete chlorination works, water-power, air-compressors, power-drills, sawmill, and everything in and about the property, show the ability of the managers. The vein is large (25 to 30 feet) and the mine may be called a low-grade proposition, worked on a necessarily large scale. The stamp-mill is crushing $3\frac{1}{2}$ tons per stamp every 24 hours, or 200 tons per day. By reason of the large amount of ore handled and the economy in operating, the mine is a paying property. At the present time the north shaft is used. This has a perpendicular depth of 530 feet. The ore is conveyed from the 200 and 300-foot levels. Eighty to 100 men are in the company's employ, with wages from \$2.50 to \$3 per day.

The Cave.

The cave, by which 17 men lost their lives, has been the subject of a great amount of criticism. In consequence, I asked Mr. Lane for a correct version of the sad affair, and was referred to the Coroner's verdict and requested to go through the mine and inspect the scene of the accident. Stepping on to the bucket, my companion, who was one of the miners that escaped at the time of the accident, signaled the engineer and we were soon at the 330-foot level. Walking through the crescent in the tunnel driven through the country rock, we came to the place of the accident. The vein at this point is about 30 feet wide. A drift has been run through on one wall, leaving the cave on the opposite side. Once this drift is securely timbered and the miners made perfectly safe, the caved matter will be taken out and the bodies of the unfortunate miners, still hurried in this mass, removed. One set of miners is cautiously working in from the north face and occasionally finding a body, crushed and ground by the great weight of this mass of rock and timbers. Nothing short of a personal inspection could give any idea of the great force exerted by the mass of matter once it started. Huge timbers 24 inches in diameter are snapped asunder as though they had been but straws. Timbers lie in every position, crushed, broken and piled over and through each other, like a log-jam on the rivers of a timber region. Strange as it may seem, the cave is but 60 feet in length. The country beyond, at both sides, remains solid. Everything shows that once the cave started, no system of mine-timbering could have withstood the great and sudden strain of this mass of rock, thoroughly saturated with water.

The History of the Cave.

The surface ore of the Utica had been worked out in the early days by Senator Fair; others following, worked still deeper, leaving the vein open to the surface. Mr. Lane had filled this open space in with waste from the mine, but as the level of this surface was some 20 feet below the hillside, it caught a large amount of water and in the unusual storms of this season the whole country was filled to the surface with water. From the 330-foot level an upraise or stope had been carried up 80 feet. The space excavated was timbered with 20-inch timbers arranged in sets, with five feet from center to center. Mr. Hayward had placed his old timbermen on the Plymouth, Mr. Geo. Williams in charge as hose timberman. Mr. Williams, by reason of his ability, age and the confidence reposed in him, was given entire charge of all the timbering in the mine. While he discussed the way in which he proposed timbering with the mine foreman and superintendent, they did not direct or dictate in any way to him. The ground had become heavy with its load of water, and the timbers showed that they were springing—not an unusual occurrence, as every mining man knows. The day before the cave, Mr. Williams asked Mr. Lane to go down into the mine and inspect it. Messrs. Lane, Williams & Lillie stood where the cave now is for over a half-hour. Mr. Williams speaking of his work and expressing the opinion that he had the mine well timbered. Mr. Lane replied: "Don't worry about its caving. If it caves you shan't be blamed in any way. Take all the men and timbers you want, only don't take any chances, for I would rather see the whole mine cave than any of the boys get hurt." To this Mr. Williams replied: "There is no danger. It can't come, the way I have it timbered, without giving us all the time we want to get out."

Mr. Lillie suggested to Mr. Williams that as the mill was full of ore, they lay their men off the following day—Sunday—and not work the mine and reduce expense to that amount. Mr. Williams replied that as the mine showed signs of springing, he would do some work to make it secure.

At the time of the accident 20 men were employed at this point. One of the men started out for a shovel and two more were at the outer ledge, when, suddenly and without the slightest warning, the roof dropped like a veritable deadfall, and 17 men, in an instant, were killed as suddenly as though executed by electricity. The excited imagination of some of the towns-people caused them to assert that the voices of miners could be heard on the 140 foot level. The Sept. went all through this level, which was then intact without finding any men. Scarcely had he reached the surface when the mine caved from the surface down. Mr. Williams was not then, nor is his memory now, charged with carelessness or ignorance. The cave was like that of the old Dead Horse of Tuolumne county, the Golden Tera of Dakota and many others where the overhanging matter suddenly breaks loose and crushes everything beneath it by its overwhelming force. The all-wise critics would make it appear that the mine-owners were benefited, and even innuendo that they had planned this great loss of life and money. If there is any one more than another anxious to prevent such catastrophes, it is the superintendent and mine-owners, as an accident of that kind means not only a loss in life but one of money as well. I went out of my way to investigate some of the criticisms that have been published. I find that Mrs. Williams says now that "Mr. Williams left that morning for his work just as he always did. He said nothing of any fear of a cave." Rumor has it that their parting on that fatal morning was of a death-bed character, Mrs. Williams pleading with her husband to not go, and he with pale face and set teeth declaring with a parting kiss that he must go, as his reputation was at stake. The statement that Mr. Lillie refused to go into the mine or let his men work for fear of the cave was misconstrued from his request to Williams that they lay the men off over Sunday. The most infamous remark, attributed to Mr. Lane, that "men were cheaper than timbers," shows the desperation of these jackals. No one who knows Mr. Lane—an old miner himself—who has gone through the works and seen the cordial relations and good-fellowship existing between Mr. Lane and all his employees, could for a moment believe a lie so infamous.

Angels, like all mining towns, has a class of hard-core miners who would not work if it were given them to do, but because they are not given positions of trust, for which they are in every way unfitted, set upon every successful man and endeavor, by false charges and cunningly misconstrued facts, to blacken his character and injure the property in his charge.

The Lane and Tullock Mine.

"Uncle Jimmy" Tullock is pounding away with his five stamps and making his ore-concentrator save all the sulphurets from the five stamps, and at the same time handled a large amount of dirty concentrates from another mill, thus giving the whole the work of 40 stamps, which it does easily. The mining industry owes the self-feeding principle of the present ore-feeders to "Uncle Jimmy," and the Tullock ore concentrator in capacity, efficiency and cheapness promises to make the concentration of all ores so cheap that they will be universally adopted.

The Gold Cliff.

This mine is still being worked under bond by Messrs. Hayward & Hobart. Rumor has it that the property is satisfactory.

Dry Crushing.

Mr. Chas. D. Smith has his dry mill in operation, and at this time it is running on concentrates from the Hale mine. These concentrates, after passing through the usual battery and plate milling, give by assay \$60 a ton. Mr. Bacon, of Mr. Smith's company, sampled the concentrates and the tailings, after they had been treated in Mr. Smith's mill, and sent both to Wiegand & Co. of Virginia City, Nev., for assay. Their certificate shows—"value of concentrates, \$60; value of tailings, \$2.06." Mr. Smith is not really very much pleased with this success, but contemplates the perfecting of an entirely new system, which he thinks will excel any other process. Mr. Smith is a firm believer in the dry process for gold ore, and "don't want any stamps in his." A part of Mr. Smith's process has been illustrated in the MINING AND SCIENTIFIC PRESS. The mill is simple and free from dust, a rare and desirable condition where dry crushing is followed. The ores are crushed dry to a fineness of 100-mesh in a pulverizer similar in construction to the Jenich mill, illustrated in the PRESS of June 29, 1889. From this the ore passes to a revolving amalgamating hand from which it is discharged into a scouring and amalgamating pan, the discharge flowing over Mr. Smith's shaking table and on to amalgamating plates.

For concentrates or high-grade ore, I think the mill will do all that Mr. Smith claims for it, but I do not see how it is possible for this or any other dry-crushing process to work the average ore to a profit. I don't question the possibility of saving \$58.94 out of \$60 concentrates that the battery and plate has failed to save, but I claim that these slow and expensive processes are best fitted for the treat-

ment of very high-grade rebellious ores or the concentrates from the old-fashioned dividend-providing stamp-mills. I was told, in Angels, that my article on "Gold Hath a Place where They Fine It" was aimed at a man in that vicinity, to which I replied that that class of men were a part of all mining history and were to be found at all times and in all places; that it was but natural that each one should think himself the party referred to, like the colored preacher who remarked to his congregation: "Dere is a pussen in dis ohnch wat steals chickens, and I'm gwine to frow die hible at his hed." Immediately, every dorky's head ducked. E. H. SCHAEFFLE.

Murphy, Cal.

The Mining Outlook in Honduras.

EDITORS PRESS:—I have been so busy with the affairs of the company which sent me down here that I have had little opportunity of informing myself of what was going on in other camps; however, I can say that the mining outlook in Honduras is brighter now than ever before in recent times, and a couple of years more will perhaps prove that the Spaniards did not carry off the highest end of her treasures.

The Rosairo Co.'s mill is to be started again very soon, I believe, with plenty of ore. It has 30 stamps. The Victoria, in Curaren, with ten stamps, is doing well and has recently developed a fine vein of silver glance in quartz. This is one of the mines which were examined in '87 for Senator Hearst, I being assayer to the party. At that time it was a mere prospect, but has developed well. Smelting in Angels valley, Department of Tegucigalpa, has been carried on in the small furnaces of the country with such success that the company has decided on sending castings for a blast furnace on the modern plan. The ore contains much blende, which is partly gotten rid of by roasting. In the Department of Olancha a rich strike in gold quartz is reported and an English syndicate is tackling the river-beds again. In Choluteca some apparently good gold mines are being opened by the Dos Hermanos Co., the superintendent, Mr. Patrick O'Hara, very sensibly resisting all temptation to put up works until he can be sure of plenty of good ore. The Victoria Co., $1\frac{1}{2}$ miles north of this place, has a large concession with plenty of veins carrying gold or silver, or both, but not sufficiently opened yet to determine their value. A mill is in course of erection with a capacity for 15 tons per day, the machinery being mostly of new design and invention. I can form but little opinion as to its value.

The mines of the Santa Lucia Co., nine miles from Tegucigalpa, are reputed to be the best, or among the best, in this department. The company has expended somewhere near \$200,000, but, owing to the circumstances on which it is not necessary here to dilate, but which are well understood here and now at the company's headquarters, no profit has been made so far. The ores had, up to about six months ago, the reputation of being "too refractory to be worked," but *nous avons change tout cela*, and proved that when they can be extracted in sufficient quantity to keep the mill occupied, they can be worked with profit even with the present "rather inefficient plant."

The mill has been stopped ever since November 19 last year, and work has been carried on in the mine (for only one of the many veins is worked) with such success that I shall be surprised if the mill should not be in operation again within six months.

The management of these mines is now eminently sensible and economical, and if so continued, the property must soon be on a paying basis. A great deal has been done, and much still remains to be done, to retrieve the errors of the former management, both in mine and mill, and unfortunately the distrust produced by needless failures and difficulties which might have been avoided have hampered the financial resources of the company to some extent, though its business honor has been kept stainless throughout. I consider the success of this company as a foregone conclusion, provided the present discreet course, with a little more vigor thrown in, shall be maintained; but a relapse into the follies of the past will insure ruin unless something shall be found in the mines which their record, though good, does not warrant the hope of. That is a really "big bonanza," as we understand it in California.

Exchange on New York is now selling at 35 to 40 per cent premium for 60 days sight. Exchange on San Francisco is rarely obtainable, though occasionally called for. United States gold commands a premium of 40 per cent in small lots required by travelers.

There is but one hotel in the capital city, Tegucigalpa; it is subsidized by the Government, notwithstanding, or perhaps in consequence of which it is a poor affair, though charging \$2.50 H. C. per day to transient customers, 25 cents for a glass of wine, liquor, etc., and 50 cents for a half bottle of warm beer. It seems to do a good business. Fleas are the most abundant game in the country, but the experienced traveler who has a cot or hammock to sleep in need not dread them. The ceremony of going to bed is a simpler affair here than with us, and though I do not know exactly how it is conducted among the so-called better class, I am aware that the common

people frequently or usually retire in a state of absolute nudity to their not too luxurious couches. There is a reason for this; the fleas, if not confined within a night-dress, may bite, but they don't *tickle*, which latter is to most people by far the more annoying. The worst practice is that of many men, and especially of travelers, sleeping, or trying to, in their underclothes.

It is a good plan to carry a stock of insect powder, which is effective against not only fleas but other vermin as well. Finally, and generally it is sufficient before retiring to shake all sheets and blankets at a little distance from the bed, and the same with whatever night-clothing is to be worn, if any; then strip completely away from the bed, leaving any fleas that may be about the person in the clothing till morning. To avoid *niquas*, usually known as jiggers in the feet, never put the bare foot to the ground or floor. In the rainy season a poncho is requisite; it is the only thing that is fit for a rider in the rain; it should be accompanied by a rubber hood or a "sou'wester." A hammock or a folding cot is very necessary. Arms are scarcely needed, though most travelers carry a revolver. The common people may be petty thieves, not highwaymen nor burglars, often. A man who remains long in the country should own a good riding mule and saddle. Even at this season of the year we have occasional showers, though the air seems dry enough and the roads are dusty. C. H. A.

Santa Lucia, Honduras.

IRON UNDER SHOCK.—British experts have been comparing notes concerning the change in the internal structure of iron under shock. One said that vibration made malleable crane chains resemble cast iron. Another thought that cold hammering axles to give high polish changes their internal structure, and his recommends finishing them at high temperature as a preventive. A Mr. Glynn thinks both cast and wrought iron are altered by successive blows—the wrought crystallized, and the crystals of the cast iron are enlarged. But another, Mr. Stephenson, cited the case of an engine connecting-rod that had vibrated 25,000,000 times and yet was perfectly fibrous. Axles that have been thought to have changed may not have been fibrous at first, for, although when a piece of iron is rolled out from a length of one foot to one of twenty feet, it must become fibrous, it does not necessarily do so when it is only drawn out from one foot to six feet. Another remarked that the change from crank-axes to the present straight form has diminished breakage. Mr. Bounel doubts any real change of internal structure and thinks that the differing results in tested specimens are quite likely to have resulted from difference in the kind of blow causing the fracture. For example, the same piece of iron may be made to show a fibrous texture by a slow, heavy blow, and a crystalline when the blow is sharp and quick. So, too, temperature may cause a difference, cold iron showing a more crystalline fracture than the same iron when somewhat warm.—*Boston Jour. of Com.*

A DYNAMITE MAGAZINE FOR HOT COUNTRIES is illustrated in *Indian Engineering* for Feb. 8th. It is designed for use in India by Mr. John Harris, dynamite instructor to the Nobel's Explosive Co. It is a brick structure 13x24 feet on plan, 15 feet high, with an arched roof 15 inches thick, and a 6-inch cement floor. The walls of the building are 18 inches thick, with but one end window and one door opening into a vestibule 10x16½ feet in plan. The boxes of dynamite are piled on oak-wood benches. On two sides of the building are two tiers, of three each, of ventilators 8 inches square, and covered with an iron grating. To prevent any mischief being done through these ventilators, they are Z-shaped in the section of the wall, the opening inside being nearly three feet above the outside opening. A lightning-rod at each end of the building terminates in a 3x3 feet $\frac{1}{2}$ inch copper ground-plate. The doors and the one shutter are made of $\frac{1}{2}$ -inch wrought iron with iron frames, so that the building is absolutely fireproof.

A GOOD IDEA.—In Paris, whenever a local shopkeeper advertises to sell "at cost," a government official, detailed for the purpose, swoops down upon him and makes a careful inspection, in order to satisfy himself that the merchant carries out what he advertises. If the latter is detected in fraud, an adequate punishment is at once meted out to him. They don't deny a man's right to sell his goods at less than cost if he chooses, but he must not publish any lying advertisement.

WEAVING GLASS.—In the new process for spinning and weaving glass into cloth, the warp is composed of silk forming the body and groundwork, on which the pattern in glass appears. Not less than 50 to 60 of the original glass strands are required to form one thread of the web, and not more than a yard of the cloth can be produced in 12 hours.

THERE are now over 60 specially built or converted steamers running on the Atlantic and Mediterranean for conveying petroleum in bulk, known as "tank" vessels, and it is estimated that they take four-fifths of the entire trade.

THE three-hundredth anniversary of the invention of the microscope is to be celebrated in Antwerp this year.

The Deep Gold Placers of California.

NUMBER II.

[Written for the Press and Copyrighted 1890, by HENRY G. HANES, F. G. S. A., F. G. S.]

Geography of the Deep Placers and Other Mining Regions of California.

The great mountain chain of California extends from the extreme north to the southern line of the State. The eastern slope is abrupt, while the western is a wide inclined plain. On this side most of the known gold deposits lie.

The placers, deep and shallow, primary and secondary, occupy a series of plateaus beginning at sea level and attaining an altitude of 6000 feet.

Individual peaks of unusual height rise to an altitude exceeding 14,000 feet, many far above the known auriferous basins or channels.

These elevated plateaus and mountain slopes are eroded with deep and precipitous gorges known on the Pacific Coast as "canyons," a word from the Spanish meaning a tube or pipe.

While the gold region extends from Siskiyou to San Diego, the principal mines lie in Plumas, Sierra, Placer, Nevada and Yuba counties, a country drained by the Feather, Yuba and Bear rivers. At least 300 hydraulic and drift mines were at one time in active operation on this area, not to mention a multitude of lesser placer washings conducted by small companies and individuals.

The true geology of California is not known. All geological coloring of the high placers is the merest guesswork; rocks seemingly sedimentary are so metamorphic that they are singularly devoid of animal and vegetable remains, although if more carefully studied, fossils might be found. In some cases a few have been accidentally discovered by prospectors, as, for example, near Cerro Gordo in Inyo county, and in Talare and San Diego counties, which limited localities are thus proven to be carboniferous.

California has been sadly remiss in not giving more attention to geological surveys of the State; we do not generally recognize the importance of information gained by miners, prospectors and a few local geologists, whose discoveries and investigations are not published because of a strange apathy on the part of those most interested, the people themselves. There are many learned men in other parts of the world who look eagerly to California for information of which they receive but little. The high placer mines of California cover but a limited area compared with that of the State. With a radius of 40 miles and with Downsville as a center, a circle may be described on the State map which will include nearly all the noted placers in the region early known as the "northern mines," from which the main part of the placer gold was gathered. Such a circle would cover an area of 5026 square miles, and would include portions of Butte, El Dorado, Nevada, Placer, Plumas, Sierra and Yuba counties.

The southern mines, which could be included within a similar circle, with Jackson, Amador county, for a center, lie at a lower altitude. They are generally of the hydraulic or shallow placer character. Portions of the following counties would be embraced within this second golden circle: Alpine, Amador, Calaveras, El Dorado, Sacramento, San Joaquin, Stanislaus and Tuolumne.

Both north and south of these mines, extending to the State lines, gold and silver are found, but the country has not been thoroughly explored, and in consequence is not so well known. There seems to be no reason why other quite as extensive deep placers may not be found when proper search is made for them. It is my opinion that every lava-capped ridge within a radius of 20 miles around Pilot Peak is underlain by a bed of gravel more or less auriferous, which may be reached by driving tunnels. The amount of gold already taken from this circle can be proved to be many millions of dollars.

RELATIVE ALTITUDES ABOVE SEA LEVEL OF THE DEEP PLACERS OF CALIFORNIA, INCLUDING A FEW MOUNTAIN LAKES AND SUMMITS.

Evolution of Placer Mining in California

Without referring to the working of auriferous deposits in California from the earliest settlement of the Territory, but beginning with the historical discovery of gold, this modern golden era will furnish all data required to show the evolution of gold mining from the simple methods of 1849 to the present system, the most perfect ever known.

Miners first sought gold in the beds of streams in the lower foothills, in which they could without great difficulty lay the shallow pans practically dry, by flaming, or by lifting the water with Chinese pumps. Their first tools were the pick, pan and shovel, by the use of which from \$5 to \$50 per day to the man was collected.

As miners flocked into the country, the known bars were soon claimed, and new-comers discovered and located others until it was difficult to find unoccupied ground without greatly extending the area.

With the spread of the gold excitement, miners continued to come to California from all parts of the world, and soon extended their explorations to the higher mountains beyond, gathering gold in such quantities that the price of common labor increased to \$16 per day and other values the world over were disturbed.

This condition of things did not confine long; the river gold was soon collected, and after a time all that poor men could gain by labor alone was gathered; mining became more costly, larger operations were undertaken and claim claims consolidated to increase capital, gigantic engineering works supplied water to dry diggings, attention was drawn from exhausted river-beds to river-banks, and it was discovered that although of lower grade, these secondary deposits could be profitably worked by improving methods and apparatus. This led in succession to the invention or re-invention of the rocker, long-tom and connected sluice; followed by ground-sluicing resulting by evolution in hydraulic mining, which attained a magnitude never before reached in the history of the world. It was the perfection of placer mining and was copied and used by other nations because of its admitted superiority. It ceased in California not from any inherent defect, or because the gold-fields were exhausted, but owing to a conflict between the agriculturists and miners, whose personal interests were antagonistic.

But new fields are being opened in other parts of the world; the perfected California processes will be introduced elsewhere, and it is a satisfaction to feel that if we are not allowed to operate our own prolific mines by this economic method, we may, at least, have the credit of teaching others how to work them.

While these events were transpiring, much experience was gained, the deep channels were discovered and the country underlain by them was carefully studied by thousands of men eager to obtain the gold. Miles of costly tunnels were driven into the hills, some of which were very successful, others less so, while many were failures.

To show what vast proportions hydraulic mining attained, it may be stated here that in 1867 there were 5323 miles of water ditches in the State, which cost \$15,575,400. (Pacific Coast Directory, 1867, fol. 79.) This did not include small working ditches of the gold mines.

Gold mining may properly be divided into two general classes, vein mining and placer mining; each of these again into numerous varieties. It is the province of this paper to deal specially with placer mining, admitting, however, that all the gold in the placers came directly or indirectly from vein matter. There are again two principal divisions in California placer mining, one known as drift mining and the other as sluice-washing or hydraulicking.

Placer Mining.

The simplest form of placer mining is pan-washing, in which the miner digs with a shovel a portion of earth which he supposes and hopes to contain gold. The charge is not more than ten pounds for a single operation, often less. This is put into an untanned, unsoldered, Russian sheet-iron pan. The operator sinks the pan in a convenient pool or vessel of water, the charge settles down, and, aided by a stirring, squeezing motion of one hand, becomes soft mud; a few shakes and a rotary agitation of the pan held under water cause the lighter particles to flow away or sink outside; the

gold, if any is present, sinks to the bottom and remains in the pan; the pebbles and rock fragments are then washed one by one, examined carefully and thrown aside if worthless; the shaking, rotary motion is continued, the coarse particles removed as before, until only a small quantity of fine matter remains. Then, with a skillful motion and manipulation only learned by practice, the miner causes the finer particles to overflow with the water over the edge of the pan, until at last only a little black sand and gold remain. In cleaning up the bedrock in early times, it was not uncommon to find from \$50 upward in a single pan-washing. While the pan is no longer thus used, it is indispensable to the prospector, miner and assayer, in many auxiliary operations connected with the more improved methods to be described.

The Cradle.

The miner's cradle does not differ much from an old-fashioned wooden domestic cradle. It is mounted on rockers and motion is imparted to it in a similar manner. One end is somewhat lower than the other, and the depressed end is open to allow the surplus water and tailings to escape. Over the upper part a movable box or hopper is placed, the bottom of which is of sheet iron punched with holes half an inch in diameter. Under the hopper, an apron of canvas inclines toward the head or higher part of the cradle; on the floor are nailed at right angles two riffle strips, each about an inch high. The miner sits or kneels by the cradle, rocking with one hand and dipping and pouring water with the other on the earth thrown into the hopper generally by another person. The coarse pebbles remain on the screen and are thrown aside as often as required; the lighter particles flow with the water through the apparatus, and the gold, if any, is found lying against the riffles; the cleanup is made in the miner's pan.

Long-Tom.

The next improvement was a rough wooden box trough from 12 to 14 feet long, the bottom covered with sheet iron, the sheets lapping like shingles. The lower end terminated in a sheet-iron screen with punched holes; below the screen was a sluice-box with six or more riffle cleats to intercept the gold. Unlike the cradle, water was brought to the head of the apparatus and flowed through it in a continuous stream; the rich dirt was shoveled in from the sides, and the howlers thrown out with a fork made like a common manure-fork, but with stronger tines.

Sluice-Box.

The long-tom was soon replaced by the sluice-box. This was a series of square troughs with sides and bottom alike, but open on the top; one end lapped into another and the line could be extended for any distance. With plenty of water any number of men could be employed to feed in the auriferous earth and throw out the howlers, as from the long-tom. The sluices were set at the proper angle on trestles or piles of howlers; riffles for collecting the gold were numerous along the line.

Ground-Sluicing.

This was introduced to increase the richness of the sluice material. Water was brought in a large flume or ditch to a point above some creek bottom or bedrock, and on the bank. The water was allowed to escape and soon cut a channel in its downward flow; this was assisted by men who picked down the banks of the new cut and aided the stream to disintegrate the earth by their labor. The concentrated matter left when the stream was turned off was partly run through sluices, and partly cleaned on the bedrock.

Booming.

Booming was an improvement on ground-sluicing. Water from a reservoir at a high elevation was set free by opening wide flood-gates; the effect was like that of a clodhopper. The banks were cut away and large trees uprooted. The gates were closed until more water collected, when the operation was repeated again and again. Sluice-washing followed this operation as in the case of ground-sluicing.

Hydraulic Mining.

The hydraulic miner creates artificial placers; his operations as compared with the work of Nature may be likened to his picking up a handful of sand and letting it run through his fingers. Before he could conduct this mode of placer mining, Nature by the patient work of centuries had arranged the conditions and prepared the materials.

Hydraulic mining commenced in a small way and increased by evolution until the apparatus employed was of great magnitude. The canvas hose of six inches in diameter, the tin nozzle with an inch aperture, the box reservoir at an elevation of 30 feet, grew gradually, until 2000 inches of water were caused to flow from a pressure-box at an elevation of 400 feet, through iron pipes 30 inches in diameter, to a nozzle aptly named a "glant," with from 6 to 9 inch aperture.

With incredible force the stream cut into the gravel banks, which seemed to melt before it like snow. The lighter particles, including howlers a foot in diameter, were washed away. Larger ones were either raised by derricks or blasted and the fragments piped away. To assist the force of water, tunnels were driven into the gravel banks, and sometimes as many as 2000 kegs of gunpowder were exploded by electricity in a single blast. To those who have not seen this operation, it may be said that if a hydraulic giant of the magnitude and pressure mentioned above were set up in front

of the Parliament buildings in London, and the water turned on, the edifice could be wrecked in a few minutes, and in a few hours every wall within reach of the stream could be thrown down in rain. By this process, earthy matter containing only a few cents' worth of gold to the cubic yard can be made to pay, although the original cost of the plant is very great.

While we are educated to regard with wonder the work of the hydraulic giant nozzle, and sensational writers exaggerate the destructive character of that mode of gold mining, claiming that unless it at once ceased, "the mountains would be washed into the sea," yet all the excavations made by the gold miners in California during the 42 years since the historical discovery of the precious metal at Sutter's Mill, have produced no geological effect worthy of the name. A single clodhopper will in a few hours cut out a deeper basin than that of the most extensive hydraulic mine in the State. These artificial cuttings, although of local importance, are not to be compared with the eroded canyons and glacial channels of the Sierra Nevada.

As it will be shown that all drift deposits are covered by a stratum of so-called lava, it will be clear that they cannot be piped out as from hydraulic mines. It will also be shown that the drift gold deposits are older than the hydraulic placers.

Hydraulic miners recover the gold contained in loose sedimentary matter, while the drift miner seeks the precious metal in the deep-lying channels. Even if hydraulic mining were not interdicted, that system would be powerless to reach the deeply buried gold.

Drift Mining.

While placer mining was most active in California, it was found that the drift mines were invariably on the margin of channels covered by eruptive matter; finding it impossible to pipe out or otherwise work the gravels so protected, the miners drove in exploring tunnels and met with elongated channels bearing generally with the trend of the lava ridges. These channels were uniformly of the same general character; on the bottom was found a bedrock of a soft schistose nature, on which lay rounded howlers of large size, almost invariably of quartz, intermixed with which, but on or near the bedrock, coarse gold, worn or battered, was discovered.

Boulders of the overlying lava, although not uncommon in the hydraulic washings, and abundant in modern river channels, were conspicuously absent from the beds of the drift mines. Overlying the gravels, but under the lava, was found a peculiar sedimentary deposit consisting of gravel, coarse and fine sand, and a peculiar clay, bearing in miners' parlance the general name "pipeclay;" on this, with a distinct line of demarcation, lay the superimposed lava.

As experiences multiplied, miners learned to expect a "rimrock" (so called) along the edge of the lava ridges, dipping channel-like, and terminating in a depression or a number of depressions in which much water was always met with.

Drift mining is another form of placer mining, in some features resembling vein mining. It is peculiar in being conducted through long tunnels called "drifts" by the California miners, whence its name. The term is not to be understood in a geological sense.

Believing, with reason, that gold would always be found under these conditions, the more enterprising miners drove long and expensive tunnels in the bedrock below the gravels, calculating to connect with the lowest depressions in the channels.

In some cases, after months and even years of labor and expense, finding their tunnel too high, and knowing the difficulty of controlling the water in a shaft or incline, they have too frequently been compelled to abandon the old and commence a new tunnel at a lower level.

When successful, the drift miners obtained gold in such quantities that they were amply repaid for the toll, difficulties and disappointments at first experienced; and their success was an incentive for others to do likewise.

The usual and most economical mode of opening a drift mine is to select a tunnel-site with much care and judgment in or near a ravine or other depression sufficiently low to drain the gravel channel by a tunnel driven through one of the bedrock shores of the channel. Ample dump and facilities for bringing water for washing are, at this stage, matters for serious consideration. The object of the tunnels is to reach the gravel deposits lying in the channel and take out the lowest and richest stratum of gravel, generally four or five feet in thickness. This is run out by gravitation, in cars, on a tramway laid in the tunnel, the seepage-water flows out also without inconvenience under the tramway, saving the expense of pumping machinery indispensable in a shaft.

These tunnels, averaging a mile in length, are not easily ventilated. Various appliances, which partly serve the purpose, are in use to overcome this difficulty. When conditions are favorable, air shafts are sunk or npraised, but being expensive, they are not universal, as they should be. In some drift mines, locomotive engines of special construction are used to haul cars loaded with gravel and to convey timber to points where they are required.

On reaching the channel, a turn is made in the direction of the tunnel, and the miners drive up the slight grade, aiming to follow the deepest depression.

(Continued on page 255.)

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

GOVER.—Amador Ledger, April 4: The Gover mill has been idle for a few days in order to put in some new concentrators, which are said to give better results than any heretofore in use. The hoisting works at the Hardenberg mine at Middle Bar are completed and pipe connections made, and everything in running order. The work of draining the shaft is progressing satisfactorily. The work of getting the mill in order is being pressed at the Amador gold mine as fast as the arrival of the machinery on the ground will allow. The car track near the mill is being straightened, showing that all differences with the Doyle claim have been mutually arranged. Negotiations are in progress to bond the North California and Joe Davis claims, which belong to the North California Mining Co., to San Francisco capitalists for \$40,000. The Italian mine, belonging to Ginocchio Bros. of Jackson, is being worked on a small scale, with very encouraging prospects. We are informed that a couple of pounds of gold was obtained recently from a pocket. The 20-stamp mill of the Seaton has been secured to crush the rock from this mine. The test crushing of rock from Bellwether claim of S. W. Bright has been completed at the one-stamp mill of the Amador mine. It is rumored that the yield amounted to about \$3 per ton, which is considered quite satisfactory when it is remembered that the quartz came from close to the surface.

SUTTER CREEK.—Considerable improvements have been made in the pumping machinery at the Wildman mine. Knight & Co. have changed the valves in the hydraulic engine, so as to about double the stroke, and therefore nearly double its capacity. The water is very strong, and it was with much difficulty that the mine could be kept dry. Now the mine will be much more pleasant to work in. At Howard's foundry they are turning out several iron cars for different mines in the county.

Calaveras.

JESUS LOPEZ MINE.—Prospect, April 5: Work has been temporarily suspended on this mine for the present, pending the arrival of Mr. Gifford, a wealthy mining man of Chicago. Mr. Gifford bonded the Lopez mine some time ago, and it is proposed to either run a tunnel, which will tap the vein at a depth of 200 feet, or utilize the water from San Antonio creek. This mine has a shaft on the vein 100 feet deep, with a lead from three to four feet wide; with good walls and gouge, and we are credibly informed that the quartz prospects well. Thus far the mine has been prospected without the aid of any machinery—a windlass being used to sink the shaft.

MINING IMPROVEMENT.—Rumor has it that several gravel mines will be opened on Central Hill the coming summer.

El Dorado.

NEW MILL.—Mountain Democrat, April 5: Ben Parlow has about completed a 5-stamp mill on the Gentle Annie mine, Poverty Point, with accommodations in the mill for 5 stamps more. The mill will be ready for operation about the latter part of next week. The ledge as far as opened shows up well, and the prospect is good for a paying mine.

BEAR CREEK.—Cor. Georgetown Gazette, April 3: J. P. Mathews contemplates extensive operations on his placer claim, near Peg-leg gulch, soon as weather permits. L. Bingham is pushing things right along on his seam diggings at the head of Polecat ravine. J. C. Day has several men employed in his gravel claim on Kanaka ravine, and from all accounts it is yielding him handsome returns. The Darling brothers are preparing to commence sinking on their mine. They continue to crush ore day and night at present.

Inyo.

INYO MARBLE.—Independent, April 5: Mr. W. A. Goodyear, geologist for the State Mining Bureau, made a visit to Keeler and the marble quarry last week. Mr. Goodyear visited the quarry two years ago and made a report upon it as it then appeared. He now asks the Independent to publish the fact that since his last visit large ledges of very beautiful marble have been uncovered and that blocks of any size that may be wanted can be taken out, entirely free from crack or blemish of any kind. He thinks the marble is of the finest quality and the quarry practically inexhaustible.

THE SYLVANIA MINES.—Mr. S. G. Gregg made a visit to the Sylvania mines recently. He reports having gone down a shaft to a depth of 80 feet. This shaft is in solid ore all the way and the vein varies from 6 to 10 feet and even more in thickness. The ore carries three ounces in gold per ton, 60 ounces silver, and about 60 per cent lead. This makes the ore worth about \$160 per ton. Mr. Gregg says the vein has not been explored beyond the shaft on either side along the ledge. On the surface the ledge is easily traced at least 600 feet. In the bottom of the shaft the vein appeared to continue without change. Mr. Gregg thinks the property is very valuable. This is one of the claims recently bought by Andy Fyfe and others from a prospector named Kincaid. An adjoining claim belonging to Bouchier & Son is more extensively prospected than the above. Mr. Gregg did not examine the mine, but he says Mr. Fyfe has it bonded and told him it was the better mine of the two. Mr. Fyfe will put up a 30-ton smelting furnace some time this spring. Mr. Gregg visited Sylvania as one of a committee appointed from Big Pine to lay out a new road from the railroad to the mines. The road will be 45 miles long and will be put through without loss of time.

IN THE SOUTHERN CAMPS.—Register, April 3: Most of the names mentioned in this item are more or less old-timers, and many Register readers will be glad to learn of the boys' present whereabouts: Richard Decker, John Lemoigne are chloriding in the Hemlock mine at Panamint; Jack Curran and John Lee are at work on their own properties in the same camp. Arthur Smith, Wm. Hannagan, Oscar Stickney, Crittenden Hampton and F. P. Meyers are with Fitzgerald at Medlock. With Mr. and Mrs. J. J. Gunn at the old Minniti properties are Paul Myrtengreen, Hugh McNeal, John Donnelly and Frank Elder. James McDouald continues at

the Defiance, and has Frank Bartho, Barna McDonald, Adolph Elias and J. Donahoe. "The Lucky Jim" boys are J. G. McLean, Luke Reagan and Wm. Avery, who are enjoying the hospitalities of the property owner, J. A. McKenzie. At Keeler Dave Holland, Paul Houard, Louis Schalten, J. N. Yandeli (the latter with the Union Mining Co.), Supt. Wrinkle and Foreman Gray are running the Soda Works with J. A. Reagan and A. M. Fleming and a few Chinamen. The old Swansea furnace slag-pile affords lucrative work to Mark Hand and Jim Stansbury. The Marble Works, in charge of Captain J. V. B. Bowman, employs ten good new-comers. The Union at Cerro Gordo, with our old Esmeralda friend, Clem Ogg, as foreman and Henry Stansfield as clerk, employs some 17 men, all of whom are strangers. There are 8 contractors in the mine besides, most of whom are regular residents of the old lead camp.

Mariposa.

THE FRANCIS.—News, April 5: Andrew O'cese, who now owns and operates the Francis mine and mill, was in Mariposa last week. Without giving the figures as to the yield per ton, Mr. O'cese expresses himself satisfied with the general results. There are about 16 men at work, under the direction of Richard Ham, who bears the reputation of being a competent mining superintendent. The mill is run by water-power from Mariposa creek, and the supply this year will hold out much later than in ordinary seasons.

Nevada.

RICH ORE.—Grass Valley Tidings, April 4: The Chabmon mine, Nevada district, continues to send out very rich ore, and with the Mountaineer pays dividends regularly. There should be more such mines in the locality.

PROPOSED MINING CONSOLIDATION.—Grass Valley Union, April 6: There is a proposition to consolidate the Morning Star and other great mining properties near Iowa Hill, by which drainage would be secured by the tunnel that is now being driven into the Morning Star ground, as it is now in over 300 feet.

San Diego.

ALONG THE GILA AND COLORADO.—Los Angeles Herald, April 5: Colonel Tommy Gates brings pleasant news of what is going on at Yuma. The old town is improving slowly but in a healthy manner, with an excellent prospect for the future. There is no end of development in mining in the district along the Colorado and Gila rivers. E. H. Harazthy is spending from \$3000 to \$4000 on the Gila, 15 miles up from Yuma, to make a thorough test of the gravel at that point. Then Mr. Gratz, of St. Louis, who represents a large syndicate of that city, is putting in a plant, at a cost of \$4000, to develop the "dirt" 30 miles above Yuma, on the California side of the Colorado. He pumps the water up 300 feet from the river to work his mill. He is doing well. Jim Cushingbury, the old superintendent of the Vulture mine, is putting in a plant, at a cost of \$10,000, twelve miles above Yuma on the Arizona side of the Colorado. This is at Laguna. Next comes a Mr. Kelly from one of the towns in Missouri, a newspaper man, who has secured several claims on the Gila, where he is making preparations to spend \$25,000 in a plant to work his mines. Mr. Blaisdell, of the Cargo Muchacho mine, 18 miles up the Colorado, is working "dirt" that pays \$16 a ton right along. He gets water from the river, too. He is making a ditch from the Gila to Gila City, where he has 15 acres of fine vines and 10 acres of excellent orchard. He will carry this ditch on to Yuma. There is a party of English people who have been about Yuma for some time. They have returned to London with samples of ore from all along the Colorado and Gila, and some from Sonora which they will carefully assay with a view of investing capital to take hold of the mines. Col. Gates thinks there is a great deal of fine dirt along that part of the country, and that there is a fine future in store for it. Many people of this city will be glad to know that Tommy has secured some of this rich mining property for himself, and they will all hope that it may turn out even richer than he thinks.

Shasta.

PROSPECTORS.—Shasta Courier, April 6: The country for miles around town is being investigated by prospectors and a number of very promising ledges are being worked. Many prospectors complain to us of professional locators or persons who plaster the country over with claim notices, but do little or no work except to prowl around and renew notices when dates expire.

CHLORINATION WORKS.—Redding Free Press, April 6: Charley Butter's chlorination works at Kennet are a big success. He is working ore from a wide range of mining-fields, having received shipments from South and Central America, from the Rocky mountain regions, and large lots from Grass Valley. Once having established the reputation of being able to extract a greater per cent of precious metals from rebellious ores—it is a fact that he can—than all the chlorination works of the country, it means that he will have to double and treble the capacity of his works. He now employs a force of from 10 to 20 men.

AT WORK.—A. McKay, tunnel contractor on the Scherer tellurium mine, has a force of about ten men at work. As soon as they get into the mouth of the tunnel, three shifts will be put on, running night and day, and the force will be increased accordingly.

SQUAW CREEK.—J. M. Vannoy came down Monday from the Squaw Creek mines, where he has a very promising piece of property himself. He says that the Uncle Sam, the Snyder and Brown and Black Bear mines, after a winter of idleness, have resumed operations. The Uncle Sam is running full blast, operating 20 stamps and feeding over 50 men. These mines started up about the first of last month. The summer of '90 will be a very active one in mining circles.

Sierra.

PIKE CITY.—Mt. Messenger, April 5: The Sunflower mine is working two men. It does not sound bad to hear the whistle blow every day. Chatfield Bros. are mining on Griskey creek and seem to be doing quite well. Nels Hansen and Frank Misley are mining near Alaska mine, Louis Barnes has charge of the Alaska mine now.

THE WIDE AWAKE.—Cor. Mt. Messenger, April 5: Allow me to correct your statement concerning the Wide Awake mine in your issue of March 22d. It looks odd when you state that the Wide Awake new tunnel seems to be just in the right place. The

old workings toward the new tunnel were longer than we anticipated, and the course we run direct to the old works shortened the distance so that when we raised a chute we had to run 80 feet thence to connect with the old works. This was all pure accident and our good luck. If the new tunnel was in the right place and direction we would have struck the old workings in November last, when the contract was finished, instead of running 175 feet to get there.

Trinity.

QUARTZ BOULDERS.—Redding Free Press, April 6: A man by the name of Bragdon and other parties recently struck a 20-acre lot of boulders on East Fork, Trinity county. The ore is rich in free gold and sulphurates, a quantity of which is displayed in the bank of Sabasta county, and judging from what the discoverers say themselves, it is one of the most remarkable finds ever made in these northern fields. There must be a tremendous ledge somewhere on the mountain-side from whence these boulders rolled, and if ever found may be a bonanza surpassing the Treadwell lode on Douglas island, Alaska.

DOING WELL.—Journal, April 5: John A. Hubbard of Douglas City was in town this week and informed us that his claim is turning out satisfactorily. Up to the present time he has had plenty of water and the production was all that could be expected. This is one of the richest mines in the county, but the lack of the required amount of water has prevented it from being one of the first in point of gold yielded annually.

PROGRESSING.—The Trinity Gold M. Co. has a small head of water in its lower ditch and in a few days the ditch will be cleared and repaired to the head and running full of water. This amount will give them about six hours run each day. It will take about a month to get water through the upper ditch, as it is badly demoralized. On the completion of the upper ditch it is estimated that a full pipe head will be had until July, and a partial head much longer. With ordinary good luck this company will make a good cleanup for the season.

WORK TO BEGIN.—Last week George Bailey went to the mine in which he is interested above Canyon City and returned the first of this week. He reports between four and five feet of snow there and it was so soft that he was unable to get around sufficiently to inspect the tunnels. He informs us that work on a trail to the mine will begin in about two weeks. The trail will be built on a good grade, so that by a little extra work in the way of widening it can put it in a condition to admit machinery over it should future development justify the erection of a mill. As soon as the trail is completed it is expected that the snow will be off sufficiently to admit of opening up the tunnels and starting new ones to tap the lode at a good depth. A good deal of development work will be done on this mine this summer and much confidence is placed in the future of the property.

NEVADA.

Washoe District.

UTAH.—Virginia Enterprise, April 5: On the 725 level cutting out a station on the northwest side of the shaft.

SIERRA NEVADA.—On the 630 level a southwest drift is advanced 233 feet from the shaft station, continuing in a porphyry formation.

UNION CON.—On the 1465 level from the north lateral drift, opposite west crosscut No. 4, east crosscut No. 1 is advanced 234 feet, continuing in hard porphyry.

MEXICAN.—On the 1465 level west crosscut No. 4, 100 feet south of No. 3, from the north drift from west crosscut No. 1, from the main north lateral drift, is extended 77 feet, continuing in porphyry carrying lines of quartz.

OPHIR.—On the 1300 have been working north-easterly, following the ore streak developed in the raise above the south drift, which having narrowed the drift was stopped. Are now working southwesterly from the top of the raise and extracted from those points 45 tons of milling ore during the week.

CON. CAL. & VA.—The 1300, 1435, 1500 and 1600 levels continue to yield the usual quantity of ore. Shipped to the Morgan mill 1048 tons and 1840 pounds of ore and to the Eureka 1752 tons and 1360 pounds; battery sample assays showing an average value of \$21.95 per ton. Bullion valued at \$50,549.30 shipped to San Francisco. Bullion valued at about \$55,000 now on hand in the local assay office.

OCCIDENTAL CON.—Continue to extract ore of good quality from the slopes on the 400 and 500 levels. The 650 level north drift is advanced 43 feet and continues in low-grade quartz. The 450 level south lateral drift from the north line is advanced 11 feet and continues showing high-grade ore.

NORTH OCCIDENTAL.—The 550 level joint east crosscut is extended 158 feet and continues in porphyry and clay. The north drift from the line west crosscut is extended 59 feet and continues in low-grade quartz and porphyry.

BEST & BELCHER.—On the 1000 level east crosscut No. 1 is extended 305 feet. Formation, soft porphyry.

GOULD & CURRY.—On the 400 level west crosscut No. 1 is extended 543 feet. Formation, hard porphyry.

NORTHWESTERN CON.—Shaft down 10 feet below 100 level in hard porphyry.

NORTH GOULD & CURRY AND EAST BEST & BELCHER.—West drift from main lateral showing vein matter.

ANDES.—The 420 level west drift from the shaft station is advanced 50 feet and continues in porphyry, clay and quartz.

SAVAGE.—Shipped 455 tons of ore, showing an average value of \$20 by battery sample assays. Bullion on hand valued at \$28,091.70. The 300 level south drift is advanced 143 feet. The raise above the 500 level has connected with the 400 level workings.

HALE & NORCROSS.—Ore shipments, suspended during the week on account of Nevada mill stamps being bung up, will be resumed to-day. The winze below the 1250 level has connected with the 1300 level and good ore is showing in the bottom.

CHOLLAR.—The 750 level east crosscut, 80 feet south of the north line, passed through 11 feet of fair-grade ore and the face is now in clay.

POTOSI.—The raise above the 950 level is up 90 feet and shows ore in the top, car samples assaying

\$59 per ton. The winze below this level is down 30 feet, the bottom showing streaks of fair-grade quartz. The 850 level east crosscut is in 130 feet. The face is in porphyry, showing streaks of quartz giving fair assays. The east crosscut on the same level, 400 feet south of the north line, is out 151 feet, the face in porphyry.

WARD COMBINATION SHAFT.—The 1800 level east drift is out 300 feet. The Julia northwest drift is out 260 feet.

ALPHA.—The 500 level west crosscut is out 535 feet and continues in porphyry. Repairs to the 600 level station timbering in progress.

EXCHEQUER.—The 500 level north line east crosscut is in 150 feet, and continues in porphyry. The 600 level north drift is out 215 feet, the face in porphyry.

CON, NEW YORK.—Top of raise above 800 level continues in fair-grade quartz. The 650 level west drift is out 235 feet, face in porphyry.

SCORPION.—The southwest drift from the 630 level shaft station is advanced 173 feet and continues in porphyry.

IMPERIAL.—The 300 level west crosscut, No. 2, continues in quartz and porphyry. The 500 level west crosscut continues in quartz and porphyry, and west crosscut No. 1 from the north lateral drift continues in the same material.

KENTUCK.—Sinking a winze in ore below the 950 level.

YELLOW JACKET.—During the week shipped 600 tons of ore, battery sample assays showing an average value of \$21.75 per ton.

CROWN POINT.—Shipped during the week 859 tons of ore, showing an average value of \$18.75 per ton by pulp assays. Bottom of winze below 300 level south drift continues in fair-grade ore. Stopping from the raise above the 160 level.

CONFIDENCE & CHALLENGE.—Work during the week confined to repairing drift timbering.

BELCHER.—The joint 850 level east crosscut is in 295 feet, the face in hard porphyry. The 200 level south drift continues in quartz showing spots of low-grade ore.

SILVER HILL.—The 260 level northeast crosscut from the northwest drift continues in quartz and porphyry.

SEG, BELCHER.—The 1000 level southeast drift is out 102 feet in quartz assaying from \$5 to \$15 per ton. The 850 level Belcher joint crosscut is in porphyry.

JUSTICE.—During the week crushed 207 tons of ore showing a value of \$27.56 per ton by battery sample assays. The 490 level south drift is out 553 feet.

ALTA.—The ore output this week was 320 tons, showing an average assay value of \$24.25 per ton by pulp assays.

OVERMAN.—Shipped 242 tons of ore during the week, showing an average value of \$18.47 per ton by battery sample assays, of which \$10.85 was gold. The raise above the 1200 northwest drift is extended 11 feet through ore assaying from \$22 to \$46 per ton.

Eureka District.

THE LORD BYRON MINE.—Sentinel, April 5: We learn from reliable sources that the Lord Byron mine of the Ruby M. Co. (Limited), of London, Eng., situated in this district, is looking splendid. The old stopes are showing a great deal of ore in sight, and a new discovery of ore has been made below the tunnel level which looks promising. The prospects of this mine are very bright.

Robinson District.

EXAMINING MINES.—Eureka Sentinel, April 5: S. H. Lanyon and O. T. Boaz arrived here last Saturday and departed on Sunday for Robinson district to examine some mining property under bond to them. Mr. Lanyon is of the firm of S. H. Lanyon & Bro., zinc smelters at Pittsburg, Kas. The firm supply the Eureka Con. M. Co. with the zinc the latter use in their refining process. They supply some of the greatest concerns of the kind west of the Rockies. Mr. Boaz is a gas engineer and the owner of the gas, electric light and waterworks at Pittsburg. We trust the gentlemen will be pleased with the mines they are thinking of investing in.

Wild Rose District.

RICH ORE CHIMNEYS.—Silver State, April 4: The Paradise M. Co. has been prospecting its mines to a considerable extent during the winter. In the Wild Goose they sank shafts and run drifts in new ground and discovered three fine chimneys of ore in different levels, one as deep as the 300-foot level. One of these ore bodies has been opened to a considerable extent and shows a vein of very good ore from 7 to 8 feet wide.

ARIZONA.

NOTES.—Prescott Courier, April 5: Johnson's pack train, with rich gold ore from the Crowned King mine, Bradshaw district, unloaded at the Prescott ore works yesterday. Crowned King and Oro Bella mills are doing profitable work. The Mockingbird mill, Cherry district, commenced work Wednesday last. Richard DeKuhn is manager; Frank Raymond and T. J. Flannery are the engineers. Mill lay idle for eight weeks. Chances are favorable for the speedy starting of the Tiger mill. Men are being sent out to work in the Tiger lode. John McDonald and Fred Sattes are in great need of a pack train to bring in ore from the Blue Dick mine. Eight thousand dollars in placer gold was the sum sent into Prescott last week. Teams to haul in coke, etc., and bring out bullion from United Verde are badly needed. B. T. Riggs, one of the owners of the Hillside mine, has come back to Prescott. He brought with him a great many pounds of very rich silver ore. Joe Howell is here from the Hillside and says it is the best silver property he has ever seen. S. G. Turner of Big Bug was in Prescott yesterday. He came via Lynx creek and says the Dixie and Farnham mills are running. Joe Chambers has charge of the last-named mill and is making it do excellent work. He saves almost every bit of gold. Sinking is all the time going on in the Boggs and Hackberry mines, Big Bug district, likewise in the Senator, Hassayampa district. Water is too plentiful in the Senator. Miners are rustling for pack animals to bring in ore.

IDAHO.

PINE GROVE.—Elmore Bulletin, April 2: But little has been done here this winter in mining matters, aside from the Franklin mine. The only

mines worked are the Mountain View and Hawk-eye, and they are both producing large quantities of ore. We have plenty of good mines here, but need capital to work them. It is uphill business for a poor prospector to do much in the way of development. If capitalists would come to this camp I am sure they would find a good place to invest their money in mines.

THE VISHNU IN NEW HANDS.—*Elmore Bulletin*, April 2: The celebrated Vishnu mine at this place has at last got into the hands of men capable of making it productive. Messrs. Woodrow & McCormick on Monday paid over the purchase money, \$30,000, to Jacob Keiser and the administrator of the estate, and were placed in possession of the property. This transfer is no small item for the prosperity of this camp. The Vishnu is noted for its great wealth of gold, but the property has for years been tied up in such a manner that it was of little benefit to its owners or the community. Henceforth it will be worked upon a large scale and in an advantageous manner. The mine is to be worked by a tunnel leading from the Elmore new shaft and the ore will be reduced at the Elmore mill. Daylight is certainly dawning for the Rocky Bar once more. With the Elmore, the Vishnu, the Pittsburg, the Ophir, the Wide West, the Goat, all being worked under the control of energetic men, what is to prevent the most prosperous mining season ever experienced in Rocky Bar?

THE BASIN MINES.—*Boise Statesman*, April 3: Mr. J. B. Emory, a merchant at Idaho City, says there is not a more hopeful class of men in the world at the present time than the miners of Boise county, and particularly those in and about Idaho City. There is a great deal of sluicing going on already and piles of rich dirt that have been taken out, which it has been impossible to wash for the past three years, on account of the scarcity of water, have been treated this spring with good results. Money is already becoming easier though the season has but just begun. Mr. Emory thinks this will be the best year Boise county will have experienced since the flush times of the first few years after the discovery of the camp. There is plenty of snow in the Basin. It is from one to ten feet deep. Piping has already commenced and men are sluicing on the small creeks and other streams. In speaking of the Bed Rock flume, Mr. Emory said that not one-half of the placer gold in Boise Basin has been taken out and he believed the work performed in the foregoing connection would pay largely. The company has over six miles of territory on More Creek to sluice, but it is not contiguous. A claim belonging to Frank Headen's estate cuts their territory in two sections. Headen had expended \$10,000 in preparing his ground for work when he was taken ill and died on Sunday last. A week more of labor and he would have been ready for sluicing. He thinks the Bed Rock Flume Co. will purchase the property of the heirs and thus connect all of their own. Mr. Emory further says there is a great amount of gold in the company's ground and that they will be successful in getting it out. Mr. Emory has a great deal of faith in the quartz mines of Boise county. He says they are being discovered and opened faster than any accounts are received and that by the time the placer-mining industry of the Basin shall have become less remunerative the lodes will be so developed as to insure great returns and the permanency of the mining business of the county. The products of the mills of Boise, large though they may be considered now, are as a drop in the bucket to what they will be by the time the placers have been worked out.

A STRIKE IN THE RED CLOUD.—*Wood River Times*, April 2: Last Saturday the news was received of a new strike recently made in the face of tunnel No. 3 in the Red Cloud group of mines. The strike is of two feet of solid galena, besides the usual flanking of concentration ore. As it was made in the face of the tunnel or drift, work in which had been discontinued by the former owners of the property because of an evident lack of confidence in the continuity of the ore body, this last strike is very encouraging.

LOST RIVER.—*Cor. Wood River Times*, April 2: The people of Houston are now feeling somewhat encouraged over the prospects of a mining boom. Several experts, representing a New York company, are now there and have secured working bonds on many of the best-known properties of the district, and it is said to be their intention to commence work as soon as practicable.

MONTANA.

GRANITE MOUNTAIN.—*Anaconda Review*, April 3: The output for the week ending March 27th of the Granite Mountain was 49 bars of bullion, containing 73,440 ounces fine silver and 164 ounces fine gold. A contract was let last Saturday to W. M. Price and Geo. Krier to run a tunnel level 125 feet on the Diamond mine in Red Lion district. This tunnel is to connect with a shaft now down 100 feet. From A. S. McDonald, who was in town from the Cable district last week, we learn that the Golden Gate property is looking very fine. The tunnels are now in 135 feet, and a good body of ore is encountered there about two feet thick. From A. C. MacCallum, who has just returned from a trip to Champion, we learn that that camp is on the high road to prosperity. The American Ruby have a crosscut at the 200-foot level, and have struck an elegant lead of silver ore. There is a great deal of building going on in the camp just now, and by the first of June everything will be booming.

BI-METALLIC.—This company seems determined to outlive the great Granite mine in every particular. During the past week excavations have been going on at the hoist, and lumber is being conveyed to the site for the building of an addition to the present shaft-house, which, when completed, will make the largest shaft-house in Montana. The company has paid off its indebtedness of \$600,000. Since the 50-stamp mill started up, a year ago last February, the company has been earning on an average of over \$50,000 per month over and above expenses, and has been steadily reducing the debt contracted in placing upon the property the necessary machinery. Previous to the completion of the plant, the mine had been producing at the rate of \$40,000 to \$50,000 monthly, which was shipped to Omaha. The mine has been systematically developed. Besides the 50-stamp mill, which has a capacity of 75 tons per day, the company has erected a tramway from the mine to the mill, about two miles in length, and hoisting works. It is the intention of the company to create a fund of from

\$100,000 to \$150,000 before paying dividends. A new engine has been ordered that will likewise be equal to any other in the State. When all these improvements are completed the Bi-Metallic will have one of the very best mining plants in Montana, and, in short, it may soon become the greatest producer—or at least equal the Granite. W. Thomas Hart, acting superintendent at the Bi-Metallic in the absence of J. B. Risque, is experimenting on a new process for roasting the Bi-Metallic ores, and the first test was made last Tuesday. Should this new undertaking prove a success, the company intend treating their base ores by the roasting process instead of building a smelter.

FRANKLIN.—*Deer Lodge New Northwest*, April 4: The company has expended in development something like \$12,500, which is really much less than it would have cost to have sunk a shaft to the depth of the tunnel of 391 feet. One man can handle all the waste material for two shifts of miners, while the water takes care of itself, thereby saving the expense of a hoist. The company has 930 feet more of the ledge yet unexplored, the cropping of a portion of which shows good rock.

THE ZOSOL DISTRICT.—Two fairly promising locations in this district are the Carbonate Extension and Bonanza, the properties of Wm. Zosol and Julius Richter. They are now practically only prospects. The Carbonate Extension shaft is now down over 30 feet. One carload shipped from the Emery lead last summer netted \$583, and the extension of Mr. Zosol is a lead containing similar ore. The Bonanza, the shaft of which is now down 15 feet, has ore similar to that of the Hidden Hand, in the same neighborhood. One assay made from a choice piece of rock went 46 per cent of lead and 76 ounces silver. The poorest assay went 2½ ounces silver only. The Carbonate Hill or Emery lead has more than paid expenses from the beginning.

THE AMERICAN RUBY.—The strike the latter part of last week in this mine is calculated to make the stockholders happy. At the 200-foot level the crosscut struck the footwall of the vein, which at this point measures 12 feet in width. Next to the footwall the pay streak averages 2 feet in width. Two samples from the whole of the pay streak went respectively 46.60 and 87.10 ounces silver, with about \$4 of gold. This is exclusive of the pay streak on the hanging-wall and avoiding the high-grade ore, none of the richest specimens of high-grade ore having yet been assayed. The drifting is being prosecuted east and west on the vein.

THE INCLINE.—The Incline lead, in Zosol district, is the property of Moise Menard, John Renaud and Charles Cummings. Two men have been kept at work on the lead for the last three months. An incline tunnel following the lead has been run to a length of 90 feet, with a vertical depth of from 35 to 45 feet. Two assays made last week run respectively 102 and 53.95 ounces silver. There was 3 per cent lead and 24 per cent of iron in the first assay. This does not, however, give the proper proportion of lead in the vein, as it must, the owners think, contain about 35 per cent lead.

NEW MEXICO.

DEVELOPMENT WORK.—*Silver City Enterprise*, April 5: Milt Miller, one of the fortunate owners of the Alhambra, at Black Hawk, informs the *Enterprise* that the new strike in the mine appears to be more extensive and richer than any before made. Uncle Ben Hopson of Black Hawk is still taking out rich ore, and will soon have another shipment ready. John Spiller has been employed as superintendent of the Pacific mine and mill. The lessees in the lower level of the south end of the Atlantic mine, where the ore had been somewhat pinched, have struck a good-sized body of pay ore. Iron ore is again moving from Silver City in large quantities. Hardly a day passes but what from three to six cars pass down the road. One day last week eight cars of ore, one from Georgetown, two of concentrates from the Aztec, one of zinc and four of iron from Silver City and Hanover, were shipped to various points. Zinc shipments are becoming quite a feature in our output, and the prospects are that the output of this particular class of ore will be many times doubled before the year expires. On Monday last ground was broken for the erection of a 10-stamp mill and concentrator. The site is an eligible one at the foot of the spur dipping in the valley just below town. It is put up principally for concentration the constantly increasing amount of second-class ore on the Ruby, which assays from \$40 to \$50 per ton, and of which there are 600,000 or 800,000 tons on the dump; the first-class, running from \$500 to \$700 per ton, is shipped to Socorro. This will be a great accommodation to miners and a necessary adjunct. The Graed Tower is being quietly worked with continued assurances of being a mine, and several hundred tons of second-class ore for the present will likely be concentrated at the new mill. Clark & Sullivan have a mine three miles southeast of Gold Hill that bids fair to be of some importance. They will soon ship a carload which will net \$150 gold and \$15 silver per ton.

OREGON.

PIPING.—*Jacksonville Times*, April 6: Piping is progressing at the Sterling mines at a lively rate. A big cleanup will no doubt be made there. Lansing & Drake of Brush creek have been cleaning up some ground stripped by the February flood and did well, picking up some nice pieces of gold. E. Sanderson Smith is in Steamboat district, engaged in prospecting Griffith & Co.'s quartz ledge for capitalists abroad. He has two shifts of men at work. John T. Layton of Applegate precinct has finished repairing his ditch and will commence piping at once. John Miller's extensive mines on Farmer's flat were so badly damaged by the February flood that he found it impossible to operate them this year. He may abandon them altogether if the cost of putting them into good shape again will cost as much as he thinks it will. Mr. Miller has expended several thousand dollars there and we are sorry to learn that his loss has been so great. A choice specimen of ore from the ledge of G. A. Tyler, near Grant's Pass, was laid on our table this week. It is said to assay almost 70 per cent of tin, and as the ledge is 12 feet wide and has been traced for a distance of three miles or over, the discovery of its value naturally caused considerable excitement in the vicinity of Grant's Pass. Dr. E. B. Stone of this place is now engaged in analyzing the ore to verify the assay made at San Francisco.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING APRIL 1, 1890.

- 424,599.—INCUBATOR—B. W. S. Clark, Los Angeles, Cal.
424,771.—FRUIT-PITTER, ETC.—Fleming & McLaughlin, San Jose, Cal.
424,926.—REVERSIBLE PLOW—E. S. Gerow, Lafayette, Cal.
424,782.—STEP LADDER—E. Harter, San Diego, Cal.
424,646.—STEAM BOILER—J. L. Heald, Crockett, Cal.
424,648.—TWO-WHEELED VEHICLE—J. Heilrath, Plymouth, Cal.
424,649.—VEHICLE SEAT—J. Heilrath, Plymouth, Cal.
424,656.—CONCRETE MOLD—E. L. Ransome, S. F.
424,668.—GAS ENGINE—D. S. Regan, S. F.
424,832.—CABLE LIFTER—J. C. H. Stut, S. F.
424,833.—TENSION DEVICE—J. C. H. Stut, S. F.
424,584.—RAIL-CLIMBER FOR VEHICLE WHEELS—L. A. Turner, Los Angeles, Cal.
424,842.—WAGON SPRING—W. H. Williscraft, Juniper, A. T.
424,666.—LAMP BURNER—L. Zander, Oakland, Cal.
17,725.—TRADE-MARK—Leavitt & Van Alstine, S. F.

The following brief list by telegraph, for April 3, will appear more complete on receipt of mail advices:

- California—John C. Stut, S. F., turntable; Ernest L. Rasmussen, Sacramento, and T. J. Kingst, S. F., reversible window-sash; Kliza K. Smith, S. F., marker, cutter, etc., for plaster stone-work; Joseph Oswald, assignee of Harris, Oswald & Noble, S. F., sprinkler; Rokoff E. Newin, assignor to the Vulcan Iron Works, S. F., saw-mill set works; William Gehring, San Diego, valve for steam engines; James T. Dyart, Lakeport, carriage-top litter; John Cook, S. F., sail; Hiram Butts and J. Edmonds, San Diego, brake-blocks.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUTOMATIC TENSION DEVICE FOR CABLE RAILWAYS.—John C. H. Stut, S. F. No. 424,833. Dated April 1, 1890. This automatic tension apparatus for the cables of cable railways consists of sheaves or pulleys journaled in frames and traveling or sliding upon vertical guides so as to rest upon the cable, the weight of the sheaves causing it to press upon the cables where they leave the driver, and thus take up any sudden temporary or unusual slack which may occur. The invention is designed to automatically regulate changes in the length of the cable such as often occur in long lines of cable, where the addition or removal of a number of cars tends to change the tension suddenly and temporarily. This device is independent of any mechanism for permanently taking up the stretch of the cable, but may be used in conjunction therewith.

TWO WHEELED VEHICLE.—John Heilrath, Plymouth, Amador Co. No. 424,648. Dated April 1, 1890. The object of this invention is to do away with that objectionable feature of this class of vehicles known as the "horse-motion" by providing for a sufficient independence between body and shafts which will enable the latter to have their up-and-down and lateral movement freely but without imparting any such movement to the body. The invention consists in a novel spring-connection for the divided shaft.

ADJUSTABLE VEHICLE-SEAT.—John Heilrath, Plymouth, Amador Co. No. 424,649. Dated April 1, 1890. The object of this invention is to provide for properly balancing a two-wheeled cart. This effect is produced by the adjustment forward or back of the seat so as to regulate its position to properly distribute the weight, this being an essential object in two-wheeled vehicles, where the whole weight is borne by the horse, instead of being wholly carried, as in the case of four-wheeled vehicles, by the wheels.

FRUIT-PITTING AND SPREADING MACHINE.—Geo. A. Fleming, Chas. F. Fleming and Geo. T. McLaughlin, San Jose, No. 424,771. Dated April 1, 1890. The invention relates to the class of fruit-handling machines and especially to that class adapted for the pitting or stoning of the fruit and delivering and spreading it out in suitable trays. The object is to provide a machine of this class of great capacity, effective and rapid in its operation, adapted to accurately out the fruit into halves, remove and discharge the stones, and deliver the fruit perfectly and distribute it evenly over receiving-trays.

STEAM BOILER.—John L. Heald, Crockett, Contra Costa county, assignor to the Heald Manufacturing Co. of California. No. 424,646. Dated April 1, 1890. This patent covers a new method of dealing with the gases of combustion and also the disposition of the water in steam generating apparatus and the methods of supplying and conveying the same. It consists in the arrangement of steam-generating apparatus in sections, so as to more effectually

utilize and apply the heat of fuel, in avoiding the danger of destructive explosion, and in securing an increased area of heating surface within a given amount of enveloping shell. The object of the improvement in steam boilers is to provide for a gradual reduction and absorption of the hot gases of combustion by exposing to them surfaces of varying temperature so that the transmission of heat will continue as long as the temperature of the gases is high enough to produce useful effect. In steam boilers, as commonly arranged, there is nearly uniform temperature throughout all portions exposed to the heat, and as soon as the temperature of the boiler and that of the gases approximate each other, or when the gases of combustion have fallen to the maximum temperature of the boiler, the transfer of heat ceases and it is lost, the gases escaping at a high temperature, and without having completed the useful effect of which they are still capable. The power of heat absorption being as the difference of temperature in the two cases, the transmission of heat is directly as this difference, and by allowing the temperature of the boiler to diminish with that of the gases (which is possible only by arranging a boiler in separate sections) the difference of temperature is maintained until the gases escape and all useful heat is absorbed.

REVERSIBLE PLOW.—Edward S. Gerow, Lafayette, Contra Costa Co., assignor of one-half to James Eva, S. F. No. 424,926. Dated April 1, 1890. An important feature in the construction of this plow is the turning it above the axis of rotation and beneath the beam; and also the rectangular landside, each of the sides forming a shoe upon which it travels while plowing upon either one side or the other. From its peculiar construction, when the plow is turned so that either of these sides is downward, it will soon be scoured bright and any adhering soil will be rubbed off and the landside can never become clogged in this manner. With this plow it is unnecessary to do any heavy lifting or any difficult work in changing the plows from one side to the other, as is experienced in the under-turn in use.

LAMP BURNER.—Lonis Zander, Oakland. No. 424,666. Dated April 1, 1890. The object of this invention is to provide a wick tube into which the wick may be readily and easily inserted. A slide plate in the wick tube is removed, and the wick is then inserted in the tube through the open side. Then the slide plate is put back, thus fully inclosing and confining the wick.

The Mining Companies' Financial Standing.

The following is the financial standing on the first Monday of the present month of the mining companies listed on the two exchanges in this city:

† Mine expenses and March bullion output not included.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

MECHANICAL PROGRESS.

Why the American Iron Trade Must Continue to Prosper.

The phrase "phenomenal," as applied to the increased demand and production of iron and steel products in the United States, and the advance in prices which these staples have experienced within the past seven months, while many other branches of trade and manufacture have suffered from a depression in the market, is due undoubtedly to various causes. We all know what changes were wrought in the last half of 1889, and how bright is the present prospect for the continuance of activity and profitable commerce in these metals; and if the estimates and predictions of the editor of the *Pittsburgh Dispatch* are correct, the United States will be able to maintain her present, or a better, position in the iron and steel markets of the world for a long time to come.

The "phenomenal" part of last year's trade in these commodities became still more manifest when English dealers ordered supplies—limited, it is true, and certainly in marked exception to their general rule—to be shipped to them from this country; but in view of contingencies now apparently about to arise, it would not be surprising to find this phenomenon becoming a steady feature of our commercial system in the near future.

One contingency upon which this changed condition is based by our contemporary is the increased price of coal in Great Britain. This statement is made that "the London & North-western railway, which has heretofore been making contracts for coal at the rate of 6s. per ton, has been forced to renew them at 10s. as the lowest price obtainable. Such an advance in the price of the fuel that has created English manufacturers, just as the same fuel has created Pennsylvania's industries, may have the most far-reaching effects. The difference between \$1.44 per ton and \$2.40 may involve the difference between the command of the world's market for iron manufactures and the necessity of yielding the market to better situated rivals."

The *Dispatch* may be too sanguine in this view of the situation, when it continues to argue that we have such an superabundance of coal in this country that we can sell coke to England cheaper than Englishmen can import it from other European sources. The sale of 30,000 tons of Pennsylvania coke to parties in Belgium, not long since, is referred to as an indication of the trend of coke exportation, and the cause of exultation that "the condition, if permanent, implies that Pittsburgh"—with coke and iron too high in England to longer compete with the American products—"can take the place of Birmingham in the world's commerce."

—Exchange.

Files and Their Use.

To choose a flat file, turn its edge up and look along it, selecting one which has an even sweep from end to end, and having no flat places or hollows. To choose a half round file, turn the edge upward, look along it and select that which has an even sweep and no flat or hollow places on the half round side, even though it be hollow in the length of the flat side.

In draw filing, take short, quick strokes, which will prevent the file from pinning and scratching. Long strokes, no matter how long the work may be, are useless save to make scratches. Remember, it is less the number of strokes given the file than the weight placed upon it that is effective; therefore, when using a rough file, stand sufficiently away from the work to bring the weight of the body upon the forward stroke. New files should be used at first upon broad surfaces, since narrow edges are apt to break the teeth if they have the fibrous edges unworn.

For brasswork, use the file on a broad surface until its teeth are dulled, then make two or three strokes of the file under a heavy pressure upon the edge of a piece of sheet iron, which will break off the dulled edges of the teeth and leave a new fibrous edge for brasswork.

Use hasty cut files to take off a quantity of metal of ordinary hardness; second cut in fitting, and also to file unusually hard metal; smoothing to finish in final adjustment or preparatory to applying emery cloth; dead smooth, to finish very fine work, float file on lathe work.

To prevent files from pinning, and hence from scratching, properly clean them, and then chalk them well.

SOME PECULIARITIES OF IRON.—Recent experiments show that, if a bar of hard iron be allowed to cool from a white heat to a dull redness, there is a spontaneous disengagement of heat, and its magnetic properties suddenly change. In order to ascertain whether this result might be due to the heat set free by the modification of the iron, or if it required the presence of carbon, iron was experimented with containing from 0.6 to 0.25 per cent of carbon, by which means the first phenomenon above mentioned was found to be due to the molecular transformation of the iron, and the second corresponded to a change in the relation of the iron with its carbon. It takes place at 675 degrees C., when the thermometer suddenly stops and rises some six degrees, afterward resuming

its regular fall as the metal cools. This was observed with steel containing 0.57 per cent of carbon, while with only 0.19 per cent of carbon a much slighter effect of the kind was noticed at about 749 degrees; with 1.25 per cent of carbon, the two effects appear to confound themselves. When the proportion of carbon is increased, the temperature of the transformation of the iron seems to be lowered, and that of recalcination raised, so that both come to coincide in the hard steel.—*Engineering and Mining Journal*.

ECONOMICAL PUMPING.—At the meeting of the South Staffordshire and East Worcestershire Institute of Mining Engineers held on March 3, Mr. H. Lea, the president, referred to the engineering operations of the mines' Drainage Commissioners. After pointing out that the extent of district dealt with by the commissioners might be viewed as an oblong figure of irregular outline, having a length of about twelve miles from north to south, and an average width of about six miles from east to west, its area being about seventy-two square miles, the president spoke of the successive improvements which had been made in nethering the coal measures of this portion of South Staffordshire. Matters were in such a state in 1872 that there were no fewer than 139 pumping engines at work, raising 48,000,000 gallons of water in 24 hours; but to-day instead of having to pump up 48,000,000 gallons, only 17,000,000 have to be dealt with. The 139 engines had been reduced by the year 1885 to 62, and to-day the whole "come" of the district is lifted by 17 engines. Moreover, whereas by means of the old engines the cost of raising 25,000 gallons of water 100 feet used to vary from 11d. upward, the cost of doing the same work by means of the new engines is now in some cases as low as 3½d. Notwithstanding the increased cost of coal, there has been a steady improvement in economy of pumping during the past eighteen months, so that at present the expenses have been reduced, in some cases, to as low a figure as that which Mr. Lea has given. During the half-year the commissioners' engines have raised about 1,870,525,000 gallons of water, 23½ tons of water having to be pumped for each ton of mineral raised.

CONSUMPTION OF IRON IN ARCHITECTURE.—One large cause of the enormous consumption of iron which is now taking place is the great number of huge office and other large buildings which are now being erected in all our large cities, in the construction of which iron is largely used. This fact may be especially noted in San Francisco as well as elsewhere. Attention is called to this fact in a late number of *Architecture and Building*, wherein it is stated that "many of these buildings are not what they seem. To the ordinary beholder they are built of stone, brick, terra-cotta and glass, but, in fact, the entire skeleton is of iron or steel, and all other materials are merely masks with which to clothe the monster. The building is constructed on the principle of a latticed girder or braced tower. The brick or stone-work shown is a mere shell or architectural veneer, to give the building a resemblance to its neighbors. As we are apparently only at the beginning of this new era in architecture, it is probable that the demand for iron and steel for these monstrous buildings will continue at an increasing rate."

THE IMPORTATION OF IRON INTO JAPAN is increasing yearly. Last year the total was nearly double that of 1887. The increase was most marked in rails, but ironwork and sundry iron, under which heads machinery is probably included, also showed a very marked expansion. As the figures relate to last year, they obviously represent a large increase in quantity and not merely in value. The value of the iron produced in Japan is only about \$250,000 per annum, or about three per cent of the value imported. In this expansion of consumption in Japan—which has doubtless been paralleled by similar expansion in many other comparatively little-considered markets—we have one explanation of the recent upward movement of iron prices. Iron is now so extensively employed all over the world that even a slight general demand for renewals, irrespective of the constant demand for extensions, must mean a very large demand in the aggregate.

STEEL PIPES.—Steel pipes as a substitute for cast iron now form an important item for the engineer's consideration in the conveyance of water. Such pipes are being adopted for several reasons. As their weight is only about one-quarter the weight of cast-iron pipes for the same service, the matter of transportation forms an important consideration. They are also much less liable to fracture than cast iron.

ROPE TRANSMISSION OF POWER.—At Newark-on-Trent, England, a steel cable of less than one-half inch diameter transmits 30 to 35 horse power, without slip, at a speed of 2592 feet per minute, or 29.45 miles per hour. It is driven by eight-foot pulleys.

A HEAVY CASTING.—A bed-plate for an engine was recently cast at Newcastle-on-Tyne which weighed no less than 17 tons. It was taken to Sunderland on a "rolley" by 22 horses, and attracted great attention on the route.

SCIENTIFIC PROGRESS.

Scientific Experiments

An interesting home-made method of natural decorations consists simply in taking a glass or goblet and placing in the interior a little common salt and water. In a day or two a slight mist will be seen upon the glass, which hourly will increase until in a very short time the glass will present a very beautiful appearance, being enlarged to twice its thickness and covered with beautiful salt crystals, packed one upon another like some peculiar fungus or animal growth. A dish should be placed beneath the glass, as the crystal will run over. The color of the crystals may be changed by placing in the salt and water some common red ink or a spoonful of bluing; this will be absorbed and the white surface covered with exquisite tints. No more simple method of producing inexpensive or beautiful ornaments can be imagined, and by using different shapes and vases and shades, an endless variety of beautiful forms can be produced. The glass should be placed where there is plenty of warmth and sunlight.

Another scientific experiment which may interest some of the older as well as the younger members of the family may be made by suspending from the ceiling a thread which has previously been soaked in very salt water and then dried. To this fasten a light ring and announce that you are about to burn the thread without letting the ring fall. The thread will burn, it is true, but the ashes it leaves are composed of crystals of salt, and their cohesion is strong enough to sustain the weight of the ring attached to the thread.

Another curious experiment is that of putting an egg into a bottle without breaking the shell. Soak the egg, which must be fresh, for several days in strong vinegar. The acid of the vinegar will eat the lime off the shell, so that while the egg looks the same it is really very soft. Only a little care is required to press the egg into the bottle. When this is done, fill it half full of water and let it stand. The shell will absorb the lime and become hard again, and you have the curious spectacle of an egg the usual size in a small-necked bottle, which will be a great puzzle to those who do not understand how it is done.—*Exchange*.

SOUND SHADOWS.—In an interesting article on "Sensitive Flames and Sound Shadows," in the November issue of the *Popular Science Monthly*, Mr. W. La Conte Stevens gives an account of the experiments made in the Bay of San Francisco in 1874 by Prof. John La Conte and his son, Mr. Julian La Conte. The source of sound was not such as would give a definite pitch, like a bell, but the quick, violent, single impulse due to the explosion of dynamite employed in the blasting of rocks which obstructed the channels. The intensity of the shock thus propagated was such as to be felt as a blow on the feet of a person seated in a boat 300 feet or more from the detonating cartridge, and to kill hundreds of fish. Several vertical posts or piles, each about a foot in diameter, projected from the ground out of the water in the neighborhood. A stout glass bottle was suspended in the water about a foot in the rear of one of these piles, within the geometric shadow determined by lines supposed to be drawn from the cartridge 40 feet horizontally away. The bottle was perfectly protected from the shock of the explosion. It was then put in front of the pile. The first shock shivered it into hundreds of fragments. Other bottles, some filled with air and some with water, were similarly exposed in various directions around the pile, and with the same result—destruction, except when within the protecting shadow. The experiments were varied by immersing stout glass tubes, incased in thick paper, horizontally across the direction of the sound rays in water, between two piles which were aligned with the dynamite cartridge. These piles were 12 feet apart, the nearer one being 40 feet from the cartridge. Its shadow, therefore, just covered the second pile, and included the intermediate water, with the middle part of each tube. After an explosion these protected parts were found to be unbroken, while the ends which projected on the two sides beyond the shadow were completely shattered. The boundary between the regions of shadow and noise was sharply defined on the tubes, even at a distance of 12 feet behind the protecting pile.

THE STAR VEGA.—One of the most beautiful stars in the sky, and one that has been admired in every age of the world, is the star called Vega, in the constellation of the Lyre. It is remarkable for the exceedingly delicate tint of blue in its light. This star may be seen almost directly overhead at midnight in the middle of the summer, and with its soft radiance it forms one of the most charming features of the celestial landscapes at that season. In the early winter evenings it flashes low in the northwest. But, when we look at Vega through the megascopic eyes of the parallax hunter, it changes from a delicately beautiful star to a most portentous Cyclops of space. The distance of Vega, according to Dr. Elkin's measurement, is about 97 light-years, or more than 6,000,000 times the distance of the sun; and since we know that light varies inversely as the square of the distance, it is easily seen that Vega really pours forth more light than 900 suns like ours combined! Its heat is un-

doubtedly in the same proportion, so that if the earth should come as near to Vega as it is to the sun, we should wither into cinders before the fierce blue flash of its overpowering rays.—*New York Sun*.

WITHOUT FRICTION.—After showing that friction makes perpetual motion impossible, Prof. Hele Shaw reflects upon the state of affairs that would follow if friction were to cease to act. The whole force of nature would be at once changed, and much of the dry land and most of our buildings would disappear beneath the sea. Such inhabitants as remained a short time alive would not only be unable to provide themselves with fire or warmth, but would find their very clothes falling back to the original fiber from which they were made; and if not destroyed in one of the many possible ways—no longer dissipated by friction through the air, or by falling masses of water, no longer retarded by the atmosphere and descending as rain—would be unable to obtain food, from inability to move themselves by any ordinary method of locomotion, or, what would be equally serious, having once started into motion, from being unable to stop except when they came into collision with other unhappy beings or moving bodies. Before long they, with all heavier substances, would disappear forever beneath the waters which would now cover the face of a lifeless world.

ICEBERG DUST.—One of the most interesting contributions of Prof. Nordenskjöld to popular science is his examination—when about 80° N. latitude, before reaching Parry's Island, to the northwest of Spitzbergen—of the snow which covered the icebergs, and which had come from still higher latitudes. He found it strewn with a multitude of minute black particles, spread over the surface or situated at the bottom of little pits, a great number of which were to be seen on the outer layer of snow; many of such particles were also lodged in the lower strata. The dust, which became gray on drying, the professor found to contain a large proportion of metallic particles attracted by the magnet, and capable of decomposing sulphate of copper. An observation made a little later upon other icebergs proved the presence of similar dust in a layer of granular crystalline snow situated beneath a stratum of light fresh snow, and another of hardened snow. Upon analysis, Prof. Nordenskjöld found this matter to be composed in varying proportions of metallic iron, phosphorus, cobalt and fragments of Diatomaceæ.

A SUBSTITUTE FOR ARSENIC.—The British Consul at Nish, in Servia, in his last report mentions that at Avala, near Belgrade, quicksilver is abundant in conjunction with a green-colored mineral which has been named avalite, the properties of which are still unknown. It is hoped that, among other uses, it may be found possible to apply it as a substitute for arsenic as a coloring body, in which event the discovery will prove a very valuable one, as avalite is said to be free from the poisonous qualities which make the employment of arsenic so dangerous. The discovery of the position of the mine is due to Prof. Clerics of Belgrade, who came upon the ancient Roman works after a search of five years. Negotiations for its purchase and working by an English company are in progress. The *Chemical Review* remarks that the new mineral, it presumes, is to be substituted for arsenical green pigments.

MAGNETIC FINGERS.—The scientists connected with the Johns Hopkins University are engaged in investigating the peculiar power possessed by the fingers of Louis Hamberger, son of a well-known merchant. If the hands of the young man are touched by any polished object, they hold it like a magnet. He can thus raise up a large number of pins. His index fingers possess the quality more than the others. He also raises up a glass tube freighted with a six-pound weight.

LIFE IN THE WATER OF SALT LAKE.—Recent observations of the waters of Great Salt Lake prove conclusively that the statements made that no form of animal or plant life exists in the lake are erroneous. No fish or other large form of animal life has been discovered, but the presence of vegetable organisms in the lake may be considered a fact from the abundance of animal existence.

THE OLDEST OBSERVATORY in the world is located at Pekin, in China. It was founded in 1279 by Kihla Khan, the first Emperor of the Mogul dynasty. There are still in it three of the first instruments of observation. These were used for the observation of Halley's comet, in 1738, and may also be used when, 22 years hence, this comet again appears.

THE YARD STICK MEASURE FOR THE STARS.—The distance that light can travel in a year, which is 63,000 times the space separating the sun from the earth, or, in round numbers, 5,859,000,000,000 miles, is taken as the unit of measurement for star distances; and this yardstick for the stars is called a light-year.

LACK OF SYMMETRY IN THE HUMAN FACE.—The two sides of the face are by no means alike. As a rule, says a German professor, the want of symmetry is confined to the upper part of the face. Among other singular eccentricities is the fact that the right ear is almost invariably higher than the left.

GOOD HEALTH.

Cure for the Blues.

No man is so miserable but who may find some one poorer and more comfortable. "Sometimes when I am blue and feel deserted, I am pleased to call to mind," said a Lichen-street wholesaler, "the day that I learned a practical lesson, and it was not very long ago, either. I was feeling awfully blue and lonesome. I saw no joy in life. I didn't know whether I was worth a dollar or not. All ventures seemed to me to fail. My wife noticed it and said, 'What's the matter?' I told her. She looked sad and went away.

"Pretty soon she came back to me and said, putting her hand on my head as I sat in my chair: 'My dear, our neighbors down under the hill in the little house are poor. I wish you would go down and see them. You had better take down some apples and potatoes, and I will find something to send to them by the time you are ready.' Then she looked in my face, and I saw something that made me feel like minding her. Well, I did as she said. I put a bushel of apples, a bushel of potatoes, some pork and other things in the wagon. But my wife added a lot of clothes from the wardrobes of our girl and boy, who had outgrown them. Then I started, and in due time got to the house. I saw there some one more miserable than I was. As I pondered our homely gifts into a washtub set to receive them, I got my first lesson in the relations of wealth. To see the woman weep tears of joy at the sight of apples and potatoes and children's cast-off clothes; the little ones, half naked, view them with wonder and almost with alarm, set me to thinking, and I said to myself, 'Man, you have done wrong. You have neglected to appreciate what has been done for you. Why, you are rich, fabulously rich, for you have a home, a business, a loving wife, and all the comforts of life.'

"A great change came over me. I grew calm and still but content, and I have never been downcast since then that I didn't seek some poor fellow more wretched than I in the hope that we both might be made less so together by mutual ministrations."—*Ez.*

SLEEP.—How many hours sleep do you require? As many as you can get. That is the general answer to such a question. No rule can be laid down. Jeremy Taylor thrived on three hours, and so does Cardinal Newman. Many centenarians are contented with five hours, but some of them require eight or nine. Unless you are afflicted with a pronounced insomnia—a thing widely different from occasional and even troublesome wakefulness—you are foolish to employ any kind of narcotic drug. But there are two rules of sleeping that everybody may adopt without hesitation. (1) Never let yourself be awakened by anybody else, but wait until you have slept out your sleep. (2) Get up as soon as you wake. If you follow these two rules, the hours of sleep will very soon regulate themselves. If you read yourself to sleep you should read a heavy book, not a light one—a book that taxes and tires your brain, not one that stirs and stimulates it. A dull book is good, a stupid one is better.—*St. James Gazette.*

SCRATCHING THE BACK INSTEAD OF QUININE. Dr. Alois Fenykovich communicates to a Vienna medical journal an account of some observations made on the treatment of intermittent fever by means of friction of the back along the spine. Many years ago, as stated in the *Lancet*, while at Nisch with his regiment, there occurred so many cases of intermittent fever that the stock of quinine was becoming exhausted, and, in order that the patients might not be entirely without some sort of treatment, it was ordered that they should be rubbed twice a day along the spine with simple ointment. The day after this order had been given, it appeared that the usual attack had not come on. Accordingly, since that time Dr. Fenykovich has very frequently employed this treatment, and usually with marked success. Indeed, he says that three-fourths of his cases have done very well without any quinine at all.

DEFECTIVE HEARING.—Over 9000 children have been examined in the schools of the following cities—New York, Stuttgart, Bordeaux, Munich and Glasgow—and the average of defective hearing pupils is 26 per cent plus. As a comparison test between children who were regarded as bright and those considered backward and dull scholars, teachers were requested to make a selection of 70 of each group. The results of the two sets, says the *British Medical Journal*, show twice as many with defective hearing among backward children as among the forward children.

CURE FOR PNEUMONIA.—Chop some onions fine, and heat in a large spider, add rye meal and vinegar to make a thick paste, and simmer for five or ten minutes. Stir it thoroughly, put it in a cotton bag large enough to cover the lungs, and apply to the chest as hot as the patient can bear; when this gets cool, apply another; thus continue, and in a few hours the patient will be out of danger.

DON'T USE CARBOLIC ACID.—Dr. T. Billroth of Vienna states that insignificant injuries are frequently made serious by the uncalled-for ap-

plication of carbolic acid, which skillful surgeons are using much less than formerly. It may cause not only inflammation, but even fatal blood-poisoning. This, therefore, should be remembered by all mechanics. Salicylate of soda, in a moderately weak solution, is infinitely better than carbolic acid for every purpose to which the latter is applied in medical or surgical practice.

OLIVE OIL FOR SNAKE BITES.—It is stated that Dr. C. R. Early of Ridgeway, Pa., uses olive oil as a cure for rattlesnake poison. It is given in doses of a teaspoonful. Half a dozen doses at frequent intervals are sufficient. The doctor has treated many cases, always successfully. Care should be taken to secure the pure article.

USEFUL INFORMATION.

A SERIOUS REFLECTION.—It is a significant fact that out of the 1060 prisoners in the Eastern Penitentiary of Pennsylvania, only 19 are mechanics. This is a strong argument in favor of mechanics as an elevator of public morals. The percentage of men engaged in mechanical pursuits to the entire male population is large, yet there are less than two per cent of the persons in this institution, and the proportion is said to be about the same in others, who are mechanics by training. Instead of trying to impress upon them the repeated saying of Horace Greeley, "Go West, young man," it might be well to advise more of them to learn trades as a prevention of crime and immorality. For the above reason, and from the further fact of the organized efforts to limit the employment of apprentices, the *Scientific American* suggests the establishment of private and public industrial schools where boys may be taught trades—such as carpentering, brick and stone masonry, molding and all branches of ironwork, etc. There can be no question but that not only mechanical employment, but all kinds of labor, both manual and mental, lessen both crime and sickness. Let us, then, give the boys a chance to earn an honest living, even though it be largely at public expense.

PLAYGROUNDS ON HOUSETOPS.—A plan for school playgrounds, which has obtained in London for some years, has been mooted in New York in connection with new school buildings in the crowded tenement district of the East Side. In these regions, space is limited and dear, and the playrooms are usually in dark and damp basements. Now it is proposed to try the experiment of having playgrounds on the roof. The plan is to carry the walls up another story, but to have no roof. In wet weather a canvas top would be spread over the room, but at all other times the children would have the full benefit of the air and the sun. This experiment has been tried in London and has been found to work satisfactorily, and in one case a glass roof—forming a "crystal room"—was set up, to the great delight and comfort of the little ones. The *Sanitary News* assumes that the aerial experiment in playgrounds will certainly be tried in connection with one of the New York schools.

TWINE FROM WOOD FIBER.—It is said that two Wisconsin men have secured a method of making harvester twine out of ordinary pine wood. The discoverers have applied for a patent, and pending its issue are guarding their secret, in regard to which a contemporary says: "It is well to give publicity to new ideas, whatever 'crankiness' they indicate, for sometimes the 'crank,' like Galileo, becomes the honored inventor of something—a theory, a practical method of performing useful labor, a machine or a new article of commerce. But of the two discoveries here recorded, the twine-makers' seems to have the best foundation and the most money before it."

A NEW ROPE FOR POWER TRANSMISSION.—A Scotch inventor makes a solid round band or rope for power transmission by impregnating flat webs of canvas or other fabrics with a solution of gutta-percha, rolling it upon itself and wrapping with cloth. A flat web is made in a similar manner by folding the fabric into layers of the desired width and passing it through pressure rolls.

PAPER-BOX MANUFACTURE.—The millions and billions of boxes manufactured for confectionery and general light commodities create an immense industry. As an article of manufacture, it is important that the boxes must be in the most compact form, as their cheapness will not justify much factory or storage room.

CHEAP CLOTHING.—John F. Plummer of New York said the country is suffering under a popular prejudice that better clothes can be got abroad than here at the same price. He declared there was no country where a man could get as good a suit of clothes for as little money as in the United States.

A NOVEL FLOWER has been found at the Isthmus of Tehuantepec. This floral chameleon has a faculty of changing its colors during the day. In the morning it is white, when the sun is at its zenith it is red, and at night it is blue.

It is said that seven-eighths of the subscriptions to the magazines are from women. This shows good taste on their part.

ELECTRICITY.

Danger from Electricity.

The continuous current is like a snake which strikes once and loses its fangs. The alternating current is a snake which can strike again and again. The latter current is coming into use in electric lighting, and it may yet be employed in the transmission of power. Theory indicates certain advantages in its use over that of the continuous current. The dangers from its employment are very great, and will need careful safeguards.

It is not, however, the possible risk to life in the contact with the ground and a dangling dead wire which has come in contact with the overhead system of electric propulsion that constitutes the most serious danger from electricity. What is most to be feared is the ease with which extensive fires can be started in cities by means of bare or poorly insulated electric circuits, of which the earth forms a portion. The electric current seeks to return to the generator which produces it by the path of least resistance.

If, therefore, a telegraph or telephone wire, or any metallic conductor, should come in contact with a bare wire conveying a powerful current, this current would seek the ground by every possible way; and if the telegraph or telephone wire should be connected with the ground, the powerful current would be directed through telegraph or telephone instruments in offices and houses to ground connections. It is said, in reply to this view, that lightning frequently has entered houses by telephone and telegraph wires, and has merely burnt out a coil, or fused a wire, and has not caused any serious conflagration. A sudden discharge through a circuit, however, is not so dangerous as a slow, insidious heating, which might go on for several hours before it is discovered. This heating could easily be produced by a portion of a powerful current leaking into houses and offices from a wire which has fallen upon a bare circuit through which a current is flowing. What is to prevent, it may be asked, a great city being set on fire by electricity, in a hundred places at once, on the night of a blizzard? The inquiry is certainly not a frivolous one. The elements of danger are with us, and the questions of safeguards demand the most careful consideration by our municipal authorities.—*Prof. Trowbridge, in March Atlantic.*

DREAM OF ELECTRICITY.—"The great development in electricity will be, I am firmly convinced," said Mr. Edison to an interviewer in Paris, "in discovering a more economical process of producing it. At present we only get from coal consumed about four or five per cent of its latent electricity. The rest is wasted in heating water, expanding steam, pushing pistons, turning wheels, and finally causing a dynamo machine to operate. A process will ultimately be found for extracting 90 to 95 per cent of the latent electricity directly from the coal. Then steam engines will be abolished, and that day is not far off now. Already we can get electricity direct from coal to the amount of 90 per cent, but only for experimental purposes. When I was on shipboard coming over, I used to sit on deck by the hour and watch the waves. It made me positively savage to think of all that power going to waste. But we'll chain it up one of these days, along with Niagara Falls and the winds. That will be the electrical millennium."

AN ABSURD THEORY.—One of the latest theories advanced is, that the generation of so much artificial electricity as is now going on is changing the constitution of our atmosphere, and causing the heavy and numerous storms and epidemics which we are experiencing. It has been said that many worthy people can never be thoroughly happy unless they are miserable, and this new theory will probably give them something to worry about for awhile. It evidently owes its origin to the erroneous supposition that all the electricity generated by our dynamos is thrown off into the atmosphere, or into the ground, in the form of electricity, whole, of course, is absurd.

A NOVEL ELECTRIC SHOCK.—A painter received an electric shock the other day under somewhat novel conditions. A leaky gas pipe caught fire and soon ignited some electric-light wires which passed near it, melting off the insulation, which in turn was communicating the blaze to the surrounding woodwork. At this point a painter dashed a bucket of water on the burning matter, but received, as a reminder that he was dealing with the electric fluid, a sharp shock from the current running back along the water to his hand.

MOVABLE TELEPHONES.—There are some people who make queer dispositions of their telephones. A well-known undertaker of New York has his telephone on a dumb-waiter. He runs it up to his room at night, and can answer it without getting up. In the daytime he runs it up out of sight after he has used it, and when the people who are always wanting to "use your telephone for a moment" drop in for that purpose, he tells them they can use it if they can find it.—*Electrical Review.*

CHEMICAL AND FRICTIONAL ELECTRICITY.—Some one asks, what is the difference between electricity generated by chemical process and

that generated by friction, magnets and otherwise? The answer given is that the difference consists in tension or potential; frictional electricity has very high tension compared with that generated by a battery.

The longest distance over which conversation by telephone is daily made is between Portland, Me., and Buffalo, N. Y., about 750 miles.

ENGINEERING NOTES.

A PNEUMATIC STREET RAILROAD.—A street railroad about one and a half miles long, on an entirely new principle, is being constructed in Washington by the Judson Pneumatic Railway Co. of New York. In this system, power is to be transmitted by compressed air from a central station to a series of motors placed beneath the track at intervals of about 1500 feet. In a conduit between the rails, similar in construction to a cable-railway conduit, revolve a smooth cylinder, or series of cylinders coupled together at the ends, about six inches in diameter. These cylinders are to be kept in continuous rotation by the compressed-air motors. An adjustable blade or arm, projecting from the bottom of the car, and passing through the narrow slot into the conduit, carries at its end a group of friction-wheels, which may be pressed down forcibly upon the upper quarter of the revolving cylinder. The plane or revolution of these friction-wheels may be changed by an ingenious device controlled by a lever, to be operated by the driver of the car. While the friction-wheels revolve in the same plane as the cylinder, the frame supporting them is at rest, but the moment the axes of the wheels are thrown out of line with that of the cylinder, by a movement of the lever, the frame is driven along the cylinder by the diagonal travel of the wheels, which is similar to that of the traveling ink-distributor on some of the old-fashioned printing presses. The speed of the car is regulated by the angle of inclination of the friction-wheel axes, the cylinder revolving continuously in one direction at a uniform speed.

PECULIARITIES OF THE FORTH BRIDGE.—The 51,000 tons of steel employed in the Forth bridge is that known as mild steel, and was made on the open-hearth or Siemens-Martin process. Two qualities were employed, one to resist tensile and the other compressive strains, having strengths respectively 30 to 33 and 34 to 37 tons per square inch in tension. Under the combined circumstances of the most adverse conditions for the stability of the structure, the maximum rolling load, and the fiercest hurricane, the strain will never exceed $\frac{7}{8}$ tons per square inch and in some parts considerably less. It will readily be perceived how ample is the margin of safety allowed. The changes resulting from variations of temperature have of necessity to be allowed for, and in so large a structure they are considerable—an inch for every 100 feet being arranged for in expansion and contraction, the space over the whole length of the structure gives for this purpose no less than seven feet. For each pier and cantilever, with part of the connecting girder which it has to carry, 18 inches of play have been designed. The surfaces of the bridge requiring to be kept painted is no less than 20 acres, while the rivets employed, if laid end to end, would cover about 380 miles in length, and the plates used in the construction would extend a distance of over 45 miles.

PROGRESS OF THE MANCHESTER SHIP CANAL. At the half-yearly meeting of the shareholders of the Manchester ship canal, held lately, a report on the progress of the work was presented. From this it appears that during the last two years the contractors had carried out a proportionate part of the excavations required to be done, though during the first two months of 1888 they were necessarily employed in making preparations which had enabled the work to be carried on continuously without a hitch. During the last five months of the past year, weather and floods hindered the work, but had not done any permanent damage. It was the intention of the contractors to work day and night during the present year, in order to get well forward with the excavation. The masonry and concrete work was proceeding steadily. Besides the actual excavation of the canal, the railway embankments were now in a forward state, and the viaducts required were in course of construction.

THE SIBERIAN RAILROAD.—Recent foreign correspondence states that the Russian Government has decided to push vigorously the construction of the proposed railroad across Siberia. Gen. Annenkoff, the builder of the Trans-Caspian road, reckons that the entire line to Vladivostok will cost less than \$200,000,000, and that through trains can be run from the Baltic to the Pacific within five years from the beginning of construction. The development of Siberia by a transcontinental railroad would be of vast importance to the civilization of the world. This is a great undertaking indeed; but the magnitude of any great enterprise is no bar whatever to establishing it if it presents a reasonable indication for profit. The length of this new line of railway and the obstacles that must be encountered in its building would have been insurmountable a decade ago, but in this age obstacles only spur projectors to greater effort.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Wild's Roughing Rolls for Ore, 247. View of Laporte, Looking Toward Mt. Fillmore; Figure Illustrating Mechanical Theory of the Corona, 255.

ENTOMOLOGICALS.—Rolls for Working Ore; A Novel Application of Water-Power, 247. Paving Events; "Sampling Ores;" Elasticity of Masonry; The Technical Society, 254. The Solar Corona, 255.

CORRESPONDENCE.—Angels, Calaveras County; The Mining Outlook in Honduras, 248. The Deep Gold Placers in California, 249-255.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 250-251.

MECHANICAL PROGRESS.—Why the American Iron Trade Must Continue to Prosper; Files and Their Use; Some Peculiarities of Iron; Economical Pumping; Consumption of Iron in Architecture; Steel Pipes; Rope Transmission of Power; A Heavy Casting; Miscellaneous, 252.

SCIENTIFIC PROGRESS.—Scientific Experiments; Sound Shadows; The Star Vega; Without Friction; Iceberg Dust; A Substitute for Arsenic; Magnetic Fingers; Life in the Water of Salt Lake; The Yard-Stick Measure for the Stars; Lack of Symmetry in the Human Face; Miscellaneous, 252.

GOOD HEALTH.—Cure for the Blues; Sleep; Cure for Pneumonia; Scratching the Back Instead of Quinine; Defective Hearing; Don't Use Carbolic Acid; Olive Oil for Snake Bites, 253.

USEFUL INFORMATION.—A Serious Reflection; Playgrounds on House-tops; Twine from Wood Fiber; A New Rope for Power Transmission; Paper-Box Manufacture; Cheap Clothing; Miscellaneous, 253.

ELECTRICITY.—Danger from Electricity; Dream of Electricity; An Absurd Theory; A Novel Electric Shock; Movable Telephones; Chemical and Frictional Electricity; Miscellaneous, 253.

ENGINEERING NOTES.—A Pneumatic Street Railroad; Peculiarities of the Forth Bridge; Progress of the Manchester Ship Canal; Siberian Railroad, 253.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 258.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, 258.

Passing Events.

There is no change in the local industrial situation as regards the strike of the molders. A number of men have been brought from the East by the Foundrymen's Association, and while some of these have been captured by the strikers, others have gone to work in the shops. During all this trouble more or less work has been sent away from the city to be done elsewhere.

The utilization of power furnished by city water works for generating electricity to light the town, as successfully put in practice at Waterville, mentioned in another column of the PRESS, furnishes an example that may well be followed in other places on this coast where similar conditions exist.

The sunny, pleasant weather of the past week will have the effect of starting industrial operations of all kinds in all parts of the State, for it is an earnest that the long and severe winter is at last over. Building operations in this city, which have been at a standstill for months, have again commenced. The cessation of rain will also benefit mining, since the miners can now do something more than pump, which is about all that has been done for some months.

The prospect now is that we will have a very prosperous season in almost all branches of business, and that labor will be in demand. A great deal of work must be done to make up for the time lost the past winter. Altogether, the outlook is very favorable for California.

"Sampling Ores."

The *Territorial Enterprise* of April 1st attempts to instruct the public in the relative value of ore assays, classed as "car samples" and "battery assays."

While always willing to learn, it is just as well for the public to have as many points connected with the subject as possible, and therefore the PRESS takes pleasure in calling attention to a very few legally developed facts. We do this in behalf of our numerous readers, many of whom have been and still are assessment-payers and owners in Comstock mines.

Governor Stevenson of Nevada, in January, 1882, contracted with the Kentucky Mining Company, wherein he agreed in writing to return to the aforesaid company 65 per cent of the car sample or mine assay value of its ore milled by him.

Surely, the Governor, with his 35 years' experience in milling and mining Comstock ores, would not have signed such a contract if the car sample or mine assays were so totally unreliable as the *Enterprise* would have its readers believe; and withal so worthless as a check against the millmen returning less than they should to the mine for whom they were working ore. Mining stockholders contend that it is the only check against the mill retaining more than the actual loss incurred in reducing a mining company's ore to bullion. [Copy of the contract can be seen at Kentucky Mining Co.'s office, Pine St., S. F.]

Senator John P. Jones, as a witness in the trial of the Kentucky case in Department 6 of the Superior Court of S. F., Cal., in December, 1888, testified that he always, in case of milling ores, kept the car samples or mine assays for self-protection, and also to show, by comparison with the battery assays, that he was working the ores up to a satisfactory percentage of their mine value.

As a verification of this testimony, we append a copy of his weekly report to the Con. Cal. and Virginia mine when he was working their ores by contract in 1885.

AVERAGE ASSAY VALUE OF 2009 TONS OF ORE.

	Gold.	Silver.	Total.
Per car samples.....	\$3,492	\$20,443	\$23,935
Per R. R. car samples.....	9,106	20,287	29,393
Per battery samples.....	8,169	15,536	23,705

YIELD IN BULLION PER TON.

	Gold.	Silver.	Total.
.....	\$9,674	\$12,326	\$22,000
.....	W. H. LOWELL,		
.....	Clerk Con. Cal. and Virginia M. Co.		
.....	Virginia, Nevada, May 30, 1885.		

Here it will be seen that Senator Jones worked these 2009 tons of ore and returned to the company more than 76 per cent of the car sample or mine assay.

[A copy of the above report can be seen at the Con. Cal. and Virginia M. Co., Nevada Block, S. F., Cal.]

Why, then, did Senator Jones deem it necessary to make a report embracing all the ore assays? Aside from the fact that it was merely an act of justice to all stockholders, he was probably aware that the laws of the State, under which this mine was incorporated, compelled himself and all other contractors and superintendents to make just such returns, under oath, as he made. He was simply obeying the legislative Act of April 23, 1880.

We respectfully call the attention of all Virginia newspapers and superintendents of mines on the Comstock to the Act of April 23, 1880, and ask them why the law is not obeyed, as it was by Senator Jones in making his bullion returns to the Con. Cal. and Virginia Mining Company.

If the would-be teacher of the *Enterprise* should conclude to continue his system of instructing assessment-payers, let us suggest that the next lesson may give in detail the secrets of that wonderful Chollar mill. Numerous tons of ore from Hale and Norcross reported by the superintendent to average at the mine above \$40 per ton fail to give more than 50 per cent of that value at the mill.

Our attention has been called to some of the pan elimes or tailings, which look as though they had passed through a very coarse battery-screen, and they assay about 30 per cent of the assay value of the ore from which they are reported to have come.

When 25 per cent of the gold and 30 per cent of the silver assay value of ore is to be found in tailing elimes, something is radically wrong. Therefore it is suggested that superintendents of those mines obey the law, and that our enterprising teacher devote a few hours of each

day studying the manipulating of mill-screens and amalgamating pans; more particularly those pans which are constantly at work on pan-slimes for the benefit of the mill-owners. By careful study these pans may, perhaps, give away the secret of why mine assays and railroad car samples have been withheld from the stockholders of the Comstock mines for the past four years.

To supplement these remarks, the following paragraph is taken from the *Virginia Chronicle* of April 2d: "From 1875 to 1878, when nearly all of the available stamps on the Comstock and vicinity were dropping on Con. Virginia and California ore, a contract was made with mill superintendents that a certain percentage of the assay value of car and wagon ore samples must be returned in bullion, the superintendents agreeing to pay reclamation on shortage in the bullion returns if they fell below the percentage agreed upon, taking the assays made at the mines as a basis, and receiving a premium if the returns exceeded that percentage."

The Technical Society.

The regular meeting of the Technical Society of the Pacific Coast was held on Friday evening last, President John Richards in the chair. Randall Hunt, superintendent of the contractors at the building of the seawall, read an instructive paper, "Construction of Cofferdams." He said there was probably no other subject in engineering so little understood. He described coffer-dams as being temporary structures for the purpose of pumping out the water, in order that the permanent structure might be built, and said the most difficult of the kind he built was in sand. He showed a drawing of the Chippewa river dam on the Chicago, Burlington & Northern railroad, in which the coffer-dam was a partial failure. In the course of his remarks he expressed himself as favorable to caissons instead of coffer-dams and orlins. He described the caisson now being used in the construction of the seawall at the foot of Market street, in which the caisson method has superseded the coffer-dam method. At the close a vote of thanks was tendered the speaker, and a motion was carried to disband the paper at some future meeting.

Luther Wagoner described some experiments in stretching steel bars.

By reason of the early departure of Hubert Vischer to Honolulu, a resolution thanking that gentleman for his past services to the society was adopted.

A communication from the American Society of Engineers was read requesting the society to use its influence to test the Bear valley arch dam on the construction of the newer and higher dam, observing if any deflection occurs, as such experiments may throw considerable light on the elasticity of masonry. On motion it was decided to appoint a committee to consider ways and means for such experiments. The committee consists of E. J. Molera, Ross E. Browne, Prof. Frank Soule, Luther Wagoner, and L. N. Clement.

THE MARSHALL MONUMENT.—The State Commissioners appointed to erect a monument in memory of James W. Marshall, the discoverer of gold in California, decided to install the statue in Coloma, El Dorado county, immediately after the adjournment of the Convention of the Grand Parlor of the Native Sons of the Golden West, which will convene in Chico on the 28th of this month. The monument has cost \$5000, will be 41 feet high, consisting of a bronze statue of Mr. Marshall 11 feet high, surmounting a granite base 30 feet high, and will be placed on the lot in which the discoverer of gold is buried.

THE BEAR'S NEST.—Messrs. Venator and Bernhardt, the two German mining experts who have been examining the Bear's Nest mine, Douglas island, Alaska, have returned. It is understood that the mine is almost a complete failure. It is not likely to be abandoned, however, until a more thorough examination is made. English and German inventors are thus far heavy losers in the venture.

At Shamokin, Pa., the Cameron colliery fire got beyond control, and they had to flood the entire mine, with its 25 miles of galleries.

A HOLE accidentally burned through the roof of the caisson of the huge North River tunnel has caused the flooding of the tunnel.

Elasticity of Masonry.

The Bear Valley Dam.

The residents of Mill District, San Bernardino county, recently held a mass meeting and appointed a committee to investigate the condition of the Bear Valley dam. This committee this week reported that in its present condition, owing to the immense volume of water that would probably pour into the reservoir from the melting of the winter's snow in the mountains, they deemed the dam insecure, and that in order to make it safe the lake should be lowered to a depth of 40 feet.

The owners of the reservoir, after hearing the report of the committee, acted immediately upon their suggestions, and the water in the lake is being released as rapidly as is thought safe.

The Bear valley reservoir is situated in the San Bernardino mountains, at a great altitude above the valley. It is one of the largest artificial lakes in the United States, and is used to irrigate thousands of acres in the foothills and along the Santa Ana hills. The water of the lake empties into Bear creek and thence into the Santa Ana river. The valley of Santa Ana is quite densely populated, particularly Mill district, and the bursting of the dam would cause great loss of life and property for miles along the river.

A new and higher dam is about to be constructed below the Bear valley arch dam (which is the boldest arch dam in the world) in such a manner that the arch dam will be gradually relieved of strain by letting in water below it, which process may be repeated several times. These conditions afford a unique opportunity, never likely to recur, for determining the elastic yielding of said dam under strain, and the coefficient of elasticity of masonry as to which there is at present very imperfect information.

In response to a request made by the American Society of Civil Engineers, a committee has been appointed by the Technical Society of the Pacific Coast (as mentioned elsewhere in the PRESS) to make arrangements to cause minute observations to be made of the movements of the dam as pressure may be gradually relieved or applied.

The American Society of Civil Engineers has requested the company owning the dam to afford facilities to enable this unique opportunity to be properly availed of, asking them, in default of other engineers offering to do so, to themselves cause observations to be made by some competent observers. The practical data obtained by this proposed investigation will be of the greatest use to engineers all over the world.

SOUTHERN PACIFIC CO.—Senator Leland Stanford has retired from the presidency of the Southern Pacific Co., and C. P. Huntington has been elected in his stead. The other officers are: Charles F. Crocker, first vice-president; A. N. Towne, second vice-president; J. C. Stubbs, third vice-president; G. L. Lansing, secretary and controller; Timothy Hopkins, treasurer; N. T. Smith, assistant treasurer; C. F. Krehs, assistant secretary. Directors—C. P. Huntington, Leland Stanford, Chas. F. Crocker, Thos. E. Stillman, Thos. H. Hubbard, A. N. Towne, J. C. Stubbs, E. H. Miller, Jr., S. T. Gage, W. V. Huntington, W. E. Brown. Executive Committee—Leland Stanford, chairman; C. P. Huntington, Chas. F. Crocker, Thos. H. Hubbard.

THE STRIKE.—The Foundrymen's Association brought more molders from the East this week, and though some deserted on arrival, others are at work in the shops. The strikers still hold out, but the gradual filling up of the shops by imported men is weakening those who are "out." More men are expected from Philadelphia, Glasgow and Belgium. The shops are slowly but surely getting their complement of men.

THE QUARTZ MILLS of Montana number 48, 5 of which are in Beaverhead county, 15 in Deer Lodge, 7 in Jefferson, 5 in Lewis and Clarke, 4 in Madison and 12 in Silver Bow. Their gross output was, last year, \$24,012,000, divided as follows: Deer Lodge, \$3,604,000; Lewis and Clarke, \$1,333,000; Silver Bow, \$19,025,000. The average wages paid in these mills are \$3.45 per day.

VIEW FROM LAPORTE, LOOKING TOWARD MT. FILLMORE.—See page 249.

The Solar Corona.

Prof. Schaeherle's "Mechanical Theory."

The abstract printed below and the accompanying (a reproduction of the lantern slide used to illustrate his lecture) set forth the leading features of a new "mechanical" theory of the solar corona, which was explained to the members of the Pacific Coast Astronomical Society at its last meeting by Prof. J. M. Schaeherle of the Lick Observatory.

It was not in the least difficult for the members of the association to realize that the paper presented by Prof. Schaeherle was of extreme importance, and that it apparently solved all the mysteries attending the coronal appearances in a simple yet perfectly satisfactory manner.

Prof. J. M. Schaeherle's paper was entitled "A Mechanical Theory of the Solar Corona." It stated that his investigations seemed to prove conclusively that the solar corona is caused by light emitted and reflected from streams of matter ejected from the sun by forces which, in general, act along lines normal to the surface of the sun; these forces are most active near the center of each sun-spot zone.

Owing to the rotation of the sun, the streams of matter will not lie along normals, since the angular velocity of different portions of the stream grows less as the distance from the sun increases; in other words, the streams are double curvature. Each individual particle of the stream, however, describes a portion of a conic section which is a very elongated ellipse so long as the initial velocity is less than 353 miles per second (assuming that the sun's atmosphere, as shown by various observations, is exceedingly rare).

The variations in the type of the corona admit of an exceedingly simple explanation, being due to nothing more than the change in the position of the observer with reference to the plane of the sun's equator. According as the observer is above, below, or in the plane of the sun's equator, the perspective overlapping and interlacing of the two sets of streamers cause the observed apparent variations in the type of the corona.

Prof. Schaeherle then exhibited a model, in which the sun is represented by a ball about an inch in diameter from which radiate a number of needles, to represent the streams of matter. All these needles are contained between two zones corresponding to 30° of latitude. The longer ones are most numerous near the middle of each zone, and slightly more inclined to the normal than shown in the shorter ones, in order that the more distant portions of the needles (representing the outgoing streamers) shall have directions roughly the same as required by physical laws. Eight photographs of the model, representing the various types of the corona, were also shown, and these are reproduced in the accompanying cuts.

When the model is placed in a beam of parallel rays and its shadow allowed to fall upon a screen, the slightest change in the posi-

FIGURES ILLUSTRATING MECHANICAL THEORY OF THE CORONA.

tion of the model produces an entirely new image.

Mr. Schaeherle stated that he had thus far been unable to find a single observed phenomenon which could not be accounted for by this mechanical theory.

A discussion of the theory and a comparison showing the remarkable agreement with observation will appear in the report of the eclipse of Dec. 21, 1889.

Concisely stated, the changes in the corona studied by the Lick astronomer have been from month to month, and not—according to the former custom—according to some cycle of years. Professor Schaeherle has pointed out that the December-January eclipses will show similar coronæ; and that the April-May and the August-September eclipses will be radically different in appearances. Then, constructing his model according to the principle that the "streamers" will be longest and most numerous near the centers of each sun-spot zone, he goes on to study the appearances presented by the different cross-sections of this model as observed at various angles above and below the plane of the sun's equator. These changes will all recur within the space of one year.

In the diagrams, one and two represent the appearance when the earth is nearly in the plane of the sun's equator; three and four, one month from that "node;" five and six, two months, and seven and eight, three months from the node; nine and ten are explanatory of the varying perspective shown by the individual streamers.

Prof. Schaeherle is a well-known American astronomer, who came to the Lick Observatory from Ann Arbor, Mich. His principal work has been in connection with the Meridian Circle, but he is also known in the annals of astronomy as the discoverer of two comets (by means of telescopes constructed with his own hands), and also as the author of many mathematical papers in the "Astronomische Nachrichten," etc. His work at the Lick Observatory has shown him to be a keen observer and an investigator of the highest rank. It is highly probable that his new theory is the first step toward an entire solution of this much-vexed question regarding the solar surroundings.

The Deep Gold Placers of California.

(Continued from page 249.)

As soon as the drift reaches gravel, it is heavily timbered, even if this was not necessary before. As the work progresses, the bedrock exposed in the tunnel is cleaned up from time to time and prospected. When the work has been continued for a time upstream in the channel, cross-drifts are cut at right angles, and a series of squares is thus blocked out. Breasting then begins, the gravel is stopped out, the large boulders piled up, and only the earth known to be auriferous taken out to be washed. As the stopping progresses, the roof is supported by heavy timbers and the space is filled by refuse boulders. After the tunnel is finished, the gravel is taken out as coal is mined in a flat or nearly horizontal vein. The bottom of the working tunnel is kept in bedrock for two reasons: first, to serve as a drain, and second, that the top of the ear may be near the surface of the bedrock for convenience in filling.

This is the method in most drift mines. In exceptional cases the gravel is cemented and changed to a hard conglomerate; this must be blasted out; few if any timbers are then required. Instead of washing as in the former instance, the auriferous gravel is disintegrated in cement-mills or crushed like quartz in an ordinary stamp-mill.

When the gravel is loose, it is dumped from the cars into a "V"-shaped chamber and a powerful stream of water turned on. The lighter particles flow with the water through riffled sluice-boxes, from which the gold is collected at periodical cleanups. One man can wash the gravel taken out by 75 men.

The hydraulic stream is thrown in such a manner as not only to disintegrate the gravel but also to force it against the strong hulkheads, from which it returns with the rebound of the water and passes the nozzle in its way down the sluices. This operation causes great agitation, during which the gold falls below the earthy matter and is arrested by the riffles; boulders too large to be washed down the sluices are taken out by hand and thrown aside.

STEWART MINING BILL.—A letter written by John Dare Emersley to the San Francisco Mining and Scientific Press of March 29th and April 5th, on the "Stewart Mining bill," headed "A Defective Measure Criticized," should be carefully read and digested by every mine-owner in the land.—Eureka Sentinel.

The gripe proved fatal to many Indians on the north coast of Vancouver island.

"Sensible" Horse Power Hoisting Whims.

These Hoisting Whims are built entirely of iron and steel, mounted on a heavy base plate, and, consequently, are very durable and cannot be affected by extremes of either cold or heat or climatic influences.

The hoisting drum is completely under the control of the person in charge of the hoisting or lowering through the shaft of the mine.

As the drum is entirely independent from the driving gears, the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases their capacity by avoiding the loss of time due to stopping and starting the horse.

They are very light and compact, and can be packed for transportation by mules. Their cost of erection is very slight, two men, in half a day, being able to put one in place, ready for work.

With each Whim, working drawings are furnished, showing in detail the proper construction of Galloway Frame and foundation for Hoisting Whim.

We carry in stock the following sizes:

No. 1.—Capacity with One Horse and Single Line, 800 pounds, 75 Feet per Minute.

No. 2.—Capacity with One Horse and Single Line, 500 pounds, 125 Feet per Minute.

Weight of machine, 1200 pounds. Total shipping weight, including Sweep, Levers and Sheaves, 1400 pounds.

ROCK AND ORE CARS.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery. Adapted to heads running from 20 up to 2,000 feet. From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

**JAMES LEFFEL'S
Mining Turbine Water Wheel.**

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globes Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, April 10, 1890.

The past week has been fairly active in all branches of trade. It was generally expected that as interior roads improved, an increase in the volume of goods going out on distributive orders would be looked for.

The iron-molders' strike continues to interfere to some extent with foundry work, but, judging from present advices, the strikers will soon have to acknowledge themselves defeated, when business in that branch of trade will resume its normal condition, and upon a much more satisfactory basis.

The money market continues to show ease under freer remittances from all points on this coast, and also by more money placed in circulation in this city. Building and all other outdoor work is being vigorously pushed, giving employment to idle men, necessitating large disbursements of money. This, together with the promise of good crops and an active mining season, inspires confidence in the future, which is well calculated to promote speculation and an active money market later on.

MEXICAN DOLLARS—The market begins to show more strength. The demand from China ought to set in soon. The market is quoted at 75½ @ 75¾ cts. Exports last month were \$494,065 to Hong Kong and \$40,000 to Japan.

SILVER—The market at the East and abroad has gained in strength. This usually obtains with the India wheat crop coming in on the market. The quantity of Indian Council bills will be less than were placed last year, which should have its influence on silver. The conviction gains ground that the present Congress will pass a silver bill which will give free coinage in the near future. With the bullion piled up in the treasury vaults, it will always be a menace to European countries, and consequently they will not remonetize silver; but with free coinage in this country the remonetizing of silver by European countries will soon follow, for the minds of leading financiers at home and abroad are being disabused of the old threadbare mining-stock speculation cry when the manipulators have stock to sell, of "We are going to uncover a hidden bonanza on the Comstock." It is a well-established fact that the Comstock ore is running largely to gold, and no big bonanza like those of former days is likely to be uncovered, all stock speculators' reports to the contrary. With gold on the Comstock, silver ought to be favorably influenced, even without legislation. The silver bill will come up in Congress next Tuesday. The action of the committee having in charge the recoinage of worn or mutilated subsidiary silver coin, in reporting in favor of the National banks counting the silver a part of the reserve, is a step in the right direction.

The local silver market has been strong at 96 cts., with the Mint and exporters buying. The latter paid, in two instances, an advance on 96 cts. Yesterday (Wednesday), while the Mint's counter price was 96 cts., a sale was made direct to the Department at 96½ cts. To-day the market is very strong, with an advance obtainable. London cables came through at 44½d, and New York at 96½ cts.

QUICKSILVER—Receipts the past week aggregate 216 flasks. The receipts in last month aggregate 3493 flasks, and exports 792 flasks. The market continues strong, with a good home demand reported.

BORAX—The market is reported steady, with the Eastern demand not quite so urgent. Receipts the past week aggregate 445 cts.

ANTIMONY—The market continues bare of stock, causing nominal quotations. The East reports a firm market.

LIME—The home consumption is quite large, absorbing supplies upon receipt here. Receipts the past week aggregate 497 bbls., and exports by sea 600 bbls. to Honolulu and 150 bbls. to Hilo.

LEAD—The home demand is reported to be quite free. Receipts have been light. The market is steady. At the East, the market, after holding steady at the lower prices, is again gaining in strength. The European markets are reported weak.

COPPER—The market shows an unusually strong tone. At the East, supplies go into consumption at a good rate. The same remarks apply to Europe. The French stocks are reported to be reduced, owing to smaller quantities received from Chili and the United States.

TIN—The market for pig is barely steady. For plate the market is unchanged. Canners are reported to be well supplied and not in want of immediate requirements. It is a disputed point as to the probable quantity that will be worked up this season on this coast. From present advices we incline to the opinion that it will prove larger than that of last year.

IRON—Imports the past week aggregate 100 tons from New York. The market is still lifeless, but bidders, as far as we can learn, are not pressing sales, preferring to wait the outcome of the iron-molders' strike. The stock here is large. Eastern advices report an improved demand. They also report more furnaces being erected in the Southern States, with the output there steadily increasing. English advices report more furnaces damped, which will restrict the output of hematites fully 20 per cent. Puget sound and Oregon are drawing quite freely from the local.

COKE—The local demand is slow. There is a fair inquiry from up North.

COAL—Imports the past week aggregate as follows: Departure Bay, 6860 tons; Seattle, 10,285; Tacoma, 2200; Coos Bay, 750; Sydney, 2350; Newcastle, N. S. W., 5318; total, 27,763 tons. Warm weather and free receipts of soft coals cause an easier tone for that grade, but bidders look for little or no concession unless the weather continues warm for two or more weeks. Hard coals are firm for spot, on passage, and to arrive. The tonnage at Australia to load for this port is still light. The consumption of steam coals shows an increase.

The Hawthorne Bulletin says that Wm. T. Coleman has sold his horax deposits at Death Valley, Inyo county, to San Francisco parties for \$400,000.

Mining Share Market.

The past week has witnessed renewed activity in the mining share market, with Potosi and Chollar still in the lead. The actions of these two stocks are such as to give to close observers greater confidence in the market. Those in position to know affirm that this is a growing market with setbacks, and perhaps at times, decided breaks, particularly in the leaders. The general public are doubting Thomas, still adhering to the opinion that prices must go quite low before there is much in them. There is one thing that cannot be denied, viz., that every share of stock thrown at the pool is not only taken, but bids are made for more. In 1886 the North End stocks had a deal, the next year the Confidence-Challenge group, and now it looks as if the Chollar-Potosi group is to have a deal. In the outside stocks there is nothing doing, but toward the close, higher prices are bid for Bodie—as if the Bodie sharps are after some of the "chicken pie" so as to continue assessments.

The return of Col. Mackay to Virginia City, it is claimed, is due to an improvement in Union, and also to observe closely the work going on in Best and Belcher and Ophir. Others, again, think his object is to get up a move in the stocks so as to sell out and then go to New York City to live.

Hon. Francis G. Newlands, who is supposed to control the Gold Hill mines, will be on the Comstock the last of this month—just about the time they are ready to put the pumps in Crown Point so as to pump out the mines.

From the Comstock mines our advices report them in rich ore on the 1300-foot level of Con. Virginia, which they are stopping out. In Union they have run into ore, but the particulars are withheld. In Ophir and Best and Belcher important work is being done. The assessing of Hale and Norcross is considered by many to be an outrage on shareholders. The assessment is levied in the face of a reported rich ore development from the 1200-foot level down. In Andes, more work has been and is being done under the present management than for many years previous. The winze in Potosi continues to show well. A drift is being run through Bullion to tap the downward continuation of the ore found in the winze and upraise. In Julia, more work is being done. In Alpha, they ought soon to begin to make favorable reports of the 600-foot west crosscut. In Con. Imperial they are running a drift or crosscut so as to cut the downward continuation of the ten feet of ore found near the Challenge line. After the crosscut is advanced a little further, an upraise will be started. The joint Confidence-Challenge upraises on the 300 and 500 foot levels are in ore. In Yellow Jacket they have stopped work on the 500-foot west crosscut so as to allow the water to run off. Work will be resumed as soon as they can handle the water. Crown Point's official letter received this week reports still higher battery assays, and states that in the winze being sunk below the 300-foot level they are in good ore. The old 230-foot level west crosscut is being opened so as to advance the crosscut to a point above the 300-foot level west stopes.

From the outside mines there is nothing of particular interest to report. The suit of some of the shareholders of the Kentucky Mining Co. against Gov. Stevenson for an accounting has been compromised. The amount of money that the Governor will pay to the stockholders, we are not able to learn at this writing, but it is intimated that it will give a handsome dividend to them.

Eastern Metal Markets.

By Telegraph.

NEW YORK, April 10, 1890.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday....	43½	95½	\$14 30	\$3 87½	\$20 10
Friday.....			14 30	3 87½	20 10
Saturday.....			14 30	3 87½	20 10
Sunday.....			14 30	3 87½	20 10
Tuesday....	44	96	14 50	3 90	20 00
Wednesday..	44	96	14 50	3 90	20 00

NEW YORK, April 8.—Borax is slower, but the tone appears to be steady. Quicksilver is steady. Lead is a shade stronger under a fair demand. Tin is lower, but closed with a steadier tone. Copper is quite strong under lessening supplies and a good demand.

The Mercantile Register for Business Reference

Has taken its place as the only first-class book of reference published in San Francisco. It is a local production, devoted to the interests of the Pacific Coast, issued in two volumes alternating annually—California being especially favored by representation in both volumes—in the Northern in connection with Oregon, Washington, Montana, Idaho and Wyoming, and in the Southern with Colorado and Nevada, and the Territories of Arizona, New Mexico and Utah. It is a buyers' guide of a high standard, and the largest one in the world, while the estimation in which it is held by representative business men of the Coast is attested by the thousands of signatures kept on file by the Register Publishing Company, the originators of the work.

Its object is more to bring the buyer or consumer into direct communication with the jobber or producer than to give lists from which to mail circulars. Its extensive circulation over such an enormous territory necessarily brings it before many possible customers who are seldom favored with a visit from the traveling salesman or even glance at the many circulars that reach them, only to find their way into the waste-paper basket.

It has only to be seen to be admired, consulted once to secure a patron who remains a regular subscriber. Great care is taken to confine the names given in the lists to desirable firms, only the most substantial business houses being inserted in conspicuous capital letters that are the only distinguishing mark of "paid matter," there being no display advertisements, side-lines or corner-cards to interrupt the classified lists, attract the attention of the user or mar the typographical beauty of this page.—S. F. Examiner, March 25, 1890.

SANTA BARBARA has two miles of bituminous rock pavement, which cost \$160,000.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Bullion Shipments.

We quote shipments since our last and shall be pleased to receive further reports:

Consolidated California and Virginia, April 5, \$50,549; Savage, 5, \$28,091; Justice, 5, \$5298; Cons. California and Virginia, 9, \$56,147. Total for March account, \$246,148; Mt. Diablo, 9, \$9056.

Attention, Southern California Miners.

WORKS FOR SALE.

The Works are situated at Daggett, Cal., in the Calico Mining District, and on the side-track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power Engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to GILLISPY & CHILDS, 123 California St., San Francisco.

Assessment Notices.

AOME MILL AND MINING COMPANY; a location of principal place of business, San Francisco, California. Location of Works, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1890, an assessment, No. 10, of 3 cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of May, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, THE 9th DAY OF JUNE, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. M. BUFFINGTON, Secretary.
Office, Room 11, No. 303 California Street, San Francisco, California.

DRS. PORTERFIELD & LOSEY,
888 Market Street, San Francisco.

The Pittsburgh Boiler Scale Resolvent.

This Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.

CARNEGIE BROTHERS & CO., PROPRIETORS OF EDGAR THOMSON STEEL WORKS, }
PITTSBURGH, PA. WORKS AT BRADDOCK. }
Oct. 4, 1887. }

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have tested nearly all Compounds presented to us, and this one is the only good thing we have ever used. Our feed-water is heated in Serrymau Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as sulphate of lime, carbonate of lime, mud, and everything that is bad.

Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Allegheny Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central Iowa; Mexican Central; Delaware, Laokawanna & Western; Burlington, Cedar Rapids & Northern, Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT }
{ PROVES ENTIRELY SATISFACTORY. }

Stationary and Compound Engines, Flour, Sugar, Saw
and Quartz Mill Machinery.

AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description
ALL WORK TESTED AND GUARANTEED;
IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.
KENDALL'S PATENT, AUGUST 24, 1886.
CAPACITY. 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List. MARSHUTZ & CANTRELL.

LIDGERWOOD M'F'G CO.
MANUFACTURERS OF
HOISTING ENGINES.
300 Styles and Sizes. Over 6000 in Use.

Nos. 129 and 181 FREMONT STREET SAN FRANCISCO, CAL.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$900, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MA

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), London, October 8, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly,
THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased.
ADAMS & CARTER.

MANUFACTURERS OF ALL KINDS OF

Mining and Milling Machinery, Engines and Boilers,
SHEET-IRON WATER PIPE for Mining and Irrigation Purposes.

ALSO SAWMILL MACHINERY.

Exclusive Agents for the Pacific Coast of HEINE PATENT SAFETY BOILER and MACBETH STEEL PULLEY.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.
All Complete for \$150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "husted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make Two, Four and Eight Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

Come and see one at our works in operation, or send for circular.

SETTING OF 150-HORSE POWER HEINE BOILER WITH MECHANICAL STOKER.

Mechanical Feed for Boiler Furnaces.

On this page is an engraving of a 150-horse power Heine boiler, equipped with the Roney mechanical stoker. This boiler has a great reputation as a cheap and efficient generator of steam, and when fitted with a mechanical stoker, will successfully burn low-grade fuel, so that the cost of evaporating a pound of water into steam is materially reduced. The California Engineering Co. of this city is rapidly introducing this mechanical stoker into use on this coast. By means of this device, slack screenings, etc., may be burned without trouble, greatly reducing the cost of making steam. The machine feeds the fire with great regularity and the rocking motion of the grates prevents any caking. The application of the stoker to the remodeling of existing boiler plants is quite easy, as the stoker itself is independent of the masonry of the boiler setting.

The prospectors into the Carriso mountains on the Navajo Reservation have returned to Albuquerque, N. M., with stories of the wonderful richness in gold and silver of that section, and the ease with which the mineral can be secured, Nature providing plenty of water and timber. An effort will be made to have the district detached from the reservation.

The New England Society of California Pioneers left Boston on the 10th for a visit to California. It is the intention of the party to make trips to many of the old mining camps and towns of the State.

The Deep Gold Placers of California.

NUMBER III.

[Written for the Press and Copyrighted 1890, by HENRY G. HANES, F. G. S. A., F. G. S.]

The Deep Channels.

The ideal deep-lying auriferous channel is quite different from the real one. The ideal is a rocky trough with smooth sides and a uniform rimrock, the real one is an elongated basin scooped out of the bedrock, of varying width and depth, with an uneven and extremely rough bottom.

Such channels are uncovered in hydraulic mining but never in drifting. In the latter case they are only seen by the dim light of candles; in the former, exposed to the broad sunlight, they may be minutely examined. They are not synclinal troughs or folds, but cut channels too wide to be the work of rivers and frequently too flat to have been the beds of rapid streams. The late Mr. W. A. Skidmore thus described them as seen by him:

"These ancient channels are sinuous in their course, and have many branches and tributaries. Their grades vary from 20 to 300 feet per mile, sometimes confined within narrow banks, and again assuming lacustrine proportions."

"The San Juan Ridge at North Bloomfield has a channel about 200 feet wide on the bottom and 800 feet wide at the surface. The company own about 19,000 linear feet of the channel, which has been continuously worked since 1853."

"* * * The channel on which the Bloomfield and Milton Companies are operating has been opened in so many places that its position has been accurately determined and its contents approximately ascertained. Within the limits of the San Juan Ridge alone, in the county of Nevada, it is known that there remains to be extracted about \$90,000,000. In other portions of the county the position of the gravel channels is not at present so well known. It is, however, known that they exist for many miles in length."

While gravel channels have the same general character, they differ in detail. An accidental depression in the rimrock, explored by a bore-hole, may be mistaken for the bottom, in which case driving for it would result in disappointment and financial loss. The most skillful engineering will not insure connecting with the bottom of the channel by a drift, because there are unseen irregularities which cannot be allowed for. This may be understood by examining the channels of mines exposed by hydraulic mining.

Channel Filling.

The deep placer channels of California are filled with gravels having a varying thickness of from 20 to 400 feet. Large boulders generally lie on the bedrock. They are not of uniform size, but range from the well known cobble used in paving city streets to masses of many tons weight. Stones of lesser size than those first mentioned are designated as gravel, coarse, medium, and fine—the latter down to a quarter of an inch in diameter. Less than this is called sand, also of many grades of fineness. When it passes through a 60 mesh sieve, it becomes silt, the finest of which remains in suspension for many days. As an illustration of this, I give the result of my experiments.

A sample of muddy San Francisco surface water was taken from a small pool on the hill, near my residence on Greenwich street, Jan. 1, 1886, after a heavy rain. It was set aside and closely watched. Not until March 20 (85 days after) did it settle perfectly clear. Feb. 9, 1888, a second experiment was made, the contents of the bottle were well shaken up; the next day a stratum of the heaviest particles had settled, but the liquid was otherwise unchanged. On the 15th, more had settled, but it was still opalescent and semi-opaque. March 18, it was still milky, but the extreme upper surface to a depth of two or three millimeters was clear; all below was translucent. April 17 (67 days), it was still slightly opalescent, but the sediment had practically settled. It is silt of this character that is referred to by Dr. Trask and Prof. Blake as quoted elsewhere. It bears the general name "pipeclay" among the California gold miners.

As a rule in these deposits, boulders diminish in size and gravel becomes smaller, while the proportion of sand and silt increases from the bedrock upward.

The following measurements, selected from many, show the thickness of gravels at different localities:

	Feet.
Cotton Mine, Grizzly Canyon	20
Todd's Valley	35
Smith's Point	50
Vaughn's Claim, Wisconsin Hill	55
Gopher Hill	240
Magara, Slate Creek	300
(Of which 100 is gravel.)	
Indiana Hill	400
Cherokee Flat	430
Gold Run, Blue gravel	150
Overlaid by red gravel	300-450
Blue Tent	650

There is a marked difference between the matter filling a hydraulic channel and that of a drift mine. As a rule, the latter is almost wholly quartz, blue in the channels at a high altitude, notably near Laporte, and white lower down as at or near Dutch Flat in Placer county; while boulders of diorite, granite and other rocks are not uncommon in the hydraulic mines.

The large boulders are rounded and smooth;

coarse gravel, too, is rounded; the finer gravels, on the contrary, are all angular. The condition of the sands and silts has been stated elsewhere. The pipeclay, which is a fine glacial mud, deposited in still water, is tough and plastic when wet; when dry it takes the form of lithomarge, and breaks with a conchoidal fracture. It often contains leaves unbroken and as perfect in form as when they fell on the placid surface of a lake.

While a general uniformity in these deposits has been shown, it is not to be understood that there is no sand or fine grits near the bedrock, or boulders far above, for the interstices of the bedrock boulders are so filled, and large boulders sometimes lie many feet above. An observer who stands in a deep cut made by hydraulic mining on a large scale, may notice on the high banks so formed, indications of stratification, but not such as may be seen elsewhere in the State, indurated to sandstone; he may see that this stratification is irregular and has the appearance of having been deposited by installments, in lenticular bodies rather than in parallel strata as might be expected. As the surface is reached, the stratification becomes more regular. There is no disputing the fact that a long period of quiet must have followed the glacial era in which the great boulders were deposited on the deeply channelled bedrocks.

Similar conditions existed in the deeper drift mines, but as they all lie under lava deposits, they cannot be examined except by bore-holes, and in the few vertical shafts sunk from the surface. The faces of the banks at the Polar Star Hydraulic mine in Placer county, as exposed by the hydraulic jets, are thus irregularly stratified from bedrock to surface; some portions are stained by oxide of iron; but the boulders, be they large or small, are all white quartz. At Gold Run, in the same county, the boulders are diversified in character, hornblende, porphyry and diorite being mingled with quartz.

The gravel in hydraulic mines is always loose and easily disintegrated, otherwise this mode of mining would be impossible. In drift mines, as a rule, it is also loose, but in some cases the boulders are cemented and thus changed to the hardest conglomerates, which must be blasted out and disintegrated in cement-mills, or even wholly crushed under heavy stamps, to recover the gold that exists under the same conditions as in the loose gravels.

It is in accordance with my theory to assume that the channel filling in the deep placers is wholly local; that all the constituents originally in the soft bedrocks were set free during the ice period and simply sank downward as the soft bedrock was cut away by the ice and glacial rivers. I have found in place within a radius of ten miles around Gibsonville, all the constituents of the channel filling, including the blue quartz which gives character and name to the deposits. The similarity between the Ohio boulder clays admitted to be glacial, as shown below, is too striking to be a coincidence.

The following is a tabulated view of the principal mineral composing rocks, and their associates, likely to be found in shallow placer mines, with relative hardness and specific gravity:

Name.	Hardness.	Specific Gravity.
Graphite	1.0	2.10
Talc	1.0	2.60
Gypsum	2.0	2.30
Chlorite	2.0	2.60
Gold	2.5	19.25
Serpentine	2.5 to 4.0	2.60
Mica	2.5	3.10
Calcite	3.0	2.70
Limestone	3.0	2.70
Brittle	3.5	4.48
Dolomite	3.5	2.90
Fluor spar	4.0	3.10
Platinum	4.5	17.75
Pyroxene	5.5	3.20
Agapetite	5.5	5.10
Hornblende	5.5	3.00
Nephelite	5.5	2.50
Scapolite	5.5	2.60
Muscovite	5.5	4.50
Leucite	6.0	2.50
Hematite	6.0	4.50
Cyanite	6.0	3.40
Feldspar, Orthoclase	6.5	2.50
Olivine	6.5	3.00
Epidote	6.5	3.50
Staurolite	7.0	3.80
Tourmaline	7.0	2.94
Feldspar, Albite	7.0	2.60
Quartz	7.0	2.60
Zircon	7.5	4.75
Diamond	10.0	3.50

The glacial till in Ohio (Geological Survey of Ohio, Vol. I) much resembles that of California. There was a period of glaciation in Clarke county, an intercalation of vegetable growth, and subsequent deposit of clay and gravel, and channels were eroded resembling ours. "The floor of the county is covered with tough, compact, blue clay filled with scratched pebbles and boulders, and containing tree trunks and vegetable remains 20 to 30 feet below the present surface." There is also a heavy accumulation of ochreous gravel.

Prof. Wright has figured ("Ice Age in North America," page 114) a stratified glacial deposit on Seven-mile creek near Hamilton, Ohio, which much resembles a hydraulic mine in California; and another on folio 284 so strikingly like our hydraulic banks that, by permission, I have introduced it here. (Fig. 5.) As it is taken by the photogravure process, it is exact to nature, and not as an artist would sketch it. It has the advantage, too, of showing the details more perfectly when somewhat magnified. Another on folio 340 could be duplicated by a camera in any of the hydraulic mines of this State.

A view of a similar glacial bank as exposed in the Blue Tent hydraulic mine in Nevada county, from a photograph by Watkins of San Francisco, is reproduced for comparison. (Fig. 6.) It was taken from a greater distance than in the case of the Ohio photograph, otherwise the similarity would be more marked.

At Wahoo near Portwine, Plumas county, the Laporte channel, the channel east of Canyon creek, and the Morristown channel run within a space of 18 miles and are nearly parallel; they are 500 feet wide. The gravel is from 50 to 300 feet deep. The grade is from 60 to 200 feet to the mile. The channel filling is composed of earthy matter from the finest silt to boulders having an estimated weight of 25 tons, some of them so large that it is cheaper to drive a tunnel through than to attempt to remove them.

Boulder clay (the pipeclay of the California miner) extends over the low grounds of North Germany, Denmark, Holland, Scandinavia, Scotland, and a part of England and Ireland.

According to Geikie, the silty snepended matter in the waters of the Rhine in July and August is angular.

At the Manzanita mine, near Nevada City, Nevada county, there are found on the bedrock some dark-colored howlders, much quartz sand, and some magnetic sand. The slickens from this mine contains mica scales resulting from the decomposition of the granite bedrock.

Channel-Filling—Boulders.

There are two ways in which boulders may be formed, the commencement in both cases being the same. Fragments are sundred from rock masses by the crushing weight of superincumbent earth; by the action of frost, by local pressure, landslides, earthquakes, volcanic eruptions, by the force of sea waves, by undermining oatacracts, by lightning, by change of temperature, by glaciers or still other causes.

The surface of a glacier is generally if not invariably covered with rock fragments torn from the earth by the power of the moving ice; these vary greatly in dimensions, ranging from huge masses to coarse sand.

These rocks frequently slip into crevasses and go to the bottom of the ice sheet; pass to the edges, forming lateral moraines, or move with the current and eventually drop on the terminal moraine. All the moraines of the Muir Glacier, Alaska, contain many large blocks of stone, one of which 20 feet square and about the same height was seen by Prof. Wright, as it stood on a pedestal of ice three or four feet high.

Those rock fragments which fall into the crevasses are rolled into howlders or ground to sand. When two glaciers meet, a medial moraine is formed by the blending of the two central laterals; much of the matter in this case goes to the bottom and is crushed on the bedrock which is itself deeply channelled thereby.

John Collett (Indiana Geol. Rep. 1876, Fol. 364), writing of Montgomery county and the glacial epoch in Indiana, thus accounts for the boulders in the drift: "The glacial surface was covered with angular fragments of rocks from overhanging cliffs at the north, and with sand and gravel. Such materials, absorbing the warmth of the short arctic summer, would gradually sink in their matrix, or falling through the numerous crevasses and water-ways would reach the bedrock, over which the glacier was advancing. The softer material would be ground in this giant mill to powdered clay and sand, while the more obdurate rocks would be rounded, polished and striated as gravel and boulders which we find so plentiful in this region."

The ground material under the glacier is called by the Swiss geologists "moraine profunde" or "grundmoraine"; by the English, "howlder clay," "till," or "bottom moraine."

The erosion which cuts the channel is caused by the grinding of the rocks which fall through the crevasses. These, if of hard material, do much work when held in the frozen grasp of the glacier, while soft matter soon becomes mud and is quickly washed away.

The sand and small pebbles so formed are invariably angular, while the sands of rivers and those on the seashore are rounded and smooth. The most indurated bedrocks are ground and polished as well as channelled. The elongated glacial channels frequently cross, the new partly obliterating the older ones, indicating the shifting of the ice streams.

Another way that boulders are formed is by weathering, which includes accidental contact with other bodies by which fragments are sometimes broken off along lines of least resistance.

If a cube of considerable size could be formed of the hardest known substance, it would only be a question of time and endurance when it would be reduced to a spherical form in compliance with the laws which govern all matter. A small cube of dense and resistant matter would be longer in assuming a globular shape, but would with equal certainty arrive at that condition.

Voluminous works have been published in ancient, medieval and modern times, and elaborate experiments made to prove that boulders were wholly the work of rivers. In 1697, Gugliemini published "Physico-Mathematical Treatise on the Nature of Rivers," and Paul Frisi in 1762, a "Treatise on Rivers and Torrents." Modern works of the same character are elaborate and exhaustive. Experiments have been made at different times and places by grinding river stones of all colors and textures on grindstones and shaking them together in boxes to determine the time and force

required to reduce them to their present condition.

Frisi and Gugliemini have recorded various experiments made with a view to prove or disprove theories prevalent in their time, as to the cause of rounded howlders, pebbles and sand found in rivers.

Both assumed that the rivers in which the pebbles were found had imparted to them their spherical form, and found by experiment that, even if swept down the whole length of the stream, they could not possibly have become rounded to the extent shown in those found high up in the rivers. Failing to account by experiment for the gravel and for the sands of the vast deserts of Tartary, Frisi came to the conclusion that they were created as such, which he expressed in the following words:

"As for myself, I am of the opinion that the rounded stones, gravel and sands are substances originally prepared by Nature and spread all over the globe; that stones rolling on the bed of a river may there receive a greater degree of polish, and sands may possibly become smaller, but that stones and gravels rubbing against each other, however great may be the force, can never be converted into sand."

A river cannot make a howlder, which can only move down the stream once, and in that part only that flows in the mountains and hills; although it may polish and somewhat reduce the size of those already formed. The Mississippi river in flowing 4200 miles conveys only fine silt; there are no howlders or even pebbles in its delta.

Danree, one of the most indefatigable of modern investigators, put three kilograms of rock fragments into an iron cylinder with five liters of distilled water. After revolving 192 hours, a movement equal to 287 miles, he found 2.72 kilos of mud, while the water filtered off contained 12.6 grams of potash.

Fragments of quartz in a cylinder revolving with a velocity of one meter per second, were rounded after a journey of 25 kilometers, and could not be distinguished from pebbles found in a river-bed.

These results may account for the condition of sands and silts in rivers, and the soluble salts in their waters, but not for the gigantic boulders and the position of the channel filling and the auriferous gravels in the California drift mines. The following quotations from one of my State reports record conclusions I have drawn from actual observation. I have since observed and collected numerous samples of this howlder weathering.

"Broken masses of granite, which consist largely of quartz, naturally weather into spherical bodies and the forces of gravitation tend to produce globular forms. I have noticed, in several localities in California, large boulders of granite in place which were rounded by the slow scaling of the surface caused by frost and rain, and have observed on convex and large sized slabs still adhering loosely to the mass. When detached, a convex surface was left on the remaining part. All mineralogists know the property of quartz minerals to break with a conchoidal fracture. On the other hand, rocks which break into angular fragments are generally soft, and easily worn down by attrition with each other. On the eastern slope of the Sierra Nevada mountains, where there are no great rivers or torrents, a tains of vast extent may be seen lying against the foot of the mountain, composed wholly of angular fragments of metamorphic rocks. These deposits extend for hundreds of miles. Still in the beds of small mountain streams in the near vicinity, the ubiquitous howlder may be found. In truth, we must search beyond the present period of natural hydraulic forces for the solution of this enigma; but it may be assumed that howlders have been ground under glaciers, and subjected again and again to the action of torrents and streams during countless ages. The zircon sands described may be regarded as a strong argument in favor of this conclusion. They were formed originally in the crystalline rocks, having been set free by disintegration. The same may be said of the magnetic sands seen in place in microscopic sections of crystalline rocks. The zircons have been subjected to the attrition which has rounded the howlders and pebbles, and ground the granites to sand, but, being harder than their associates, have resisted the force, and retain their sharp angles of crystallization most perfectly. Their great specific gravity has caused them to become concentrated."

"On the route from Oroville to Magalia in Butte county, the road lies generally in valleys which have been cut through the formation known in California as 'table mountains' which are invariably capped by lava."

"In crossing these valleys it may be noticed that the plains are covered with small howlders, varying from small pebbles to masses of considerable size; these have, without doubt, fallen from higher elevations, and cannot have moved more than a few miles at most, for they are all of the basalt of the table mountain, which, geologically speaking, is very young as compared with the formation underlying it. A close study of these howlders will develop some striking features, bearing directly on the formation of the gravel deposits of California, which came to me like a revelation, and which cannot fail to interest any observer. All the fragments, be they large or small, have taken, to a greater or less extent, a rounded form, not by attrition but by natural weathering; not only are the angles all removed or rounded, but the fragments falling from them in many instances

(Continued on page 271)

How to Tell the Age of Trees.

The practical horticulturist has many methods of getting at the age of a tree without counting the rings, just as a mathematician can tell its height without ascending to the top with a foot-rule; and some of these methods I adopted when in California, to test the assumed age of the big trees by their rings, and in every case the enormous age was confirmed.

One of these methods was to take a blaze mark, the age of which was known, and count the number of rings that had been made on the outer edge since the mark was cut. I found these averaged about 16 to the inch. Counting those in the center of a cut across stump, which must have been its early growth, I found them wider. The two together, and then averaged, would give a fair ratio of age per inch. If it took 24 of these to make an inch, which the cut on the outside proved it did, a tree 20 feet in diameter would be 1680 years old. We get at this much easier than by puzzling over obscure annual rings for half a day or more.

Another way to prove age is by noting the number of main side branches growing from the trunk in many coniferous trees, of which the White Pine and Norway Spruce are familiar examples. Looking at fine specimens of these trees, the branches seem stratified. This comes from the formation of the terminal buds at the apex of the growth of the leader. There is one very strong bud for the point, and three, four or five strong ones beside it. All below are very weak buds. It is these strong buds that make the very strong horizontal shoots that afterward give the stratified appearance to the whole tree. These in the White Pine of ordinary growth are about a foot or 15 inches apart, and even though the lower lateral branches die, they leave the "knots" by which their former existence can readily be seen. I saw Sugar Pines cut in California where a hundred or more of these branches or their knots would be readily traced, and the age fixed, and the rings of wood would exactly correspond.

But there is a method I have used that I have never seen referred to in print, and a method that has served me many a good turn when desiring to know the exact age of some fine specimen on the lawn of some place, when even the owner would declare he had forgotten when the tree was planted. It may be an evergreen with the branches growing close to the ground. The same principle I have referred to, of a strong branch pushing just below the terminal bud, and making a strong branch the next year, applies also to the lateral branches—indeed even more so, as very often the strong buds are the only ones that make a lateral during one season's growth. By counting the sections backward, I found the tree 25 years old, which I happened to know was its exact age. The height also is 25 feet, as I know by my shadow. I select a time when my shadow is exactly my height, and the tree's shadow will, of course, be the tree's exact height also.

Deciduous trees, equally with evergreens, have the strongest buds just beneath the apex of the annual growth, making stronger branchlets next year, by which the annual series may be determined; but as these leave no scars when they die away, it requires a practiced eye to determine where branchlets have been. But if a horizontal branch be in vigorous growth, the length of the last annual growth may be compared with the whole growth by a mean figure obtained between what we ascertain to be a good growth in youth and the young growth before us. This, of course, is not an exact result, but one will be surprised to find, by the annual rings, how near it approximates.

Again, the age of many trees may be approximated by the rough bark. Old botanical textbooks taught that the rifts in trees were mechanical. The bark split because the trees were pushing out. I believe it was left to me originally to show that this is an error. Every tree has its own distinct method of disrupting its bark, which could not be the case if the splitting were merely mechanical. The truth is the splitting of bark arises from the growth of cork cells, and in each species these cells have a separate specific development, and usually at a specific age. In the sweet chestnut the bark commences to rift when 25 years of age, so that all above the junction of smooth and rough bark will be 25 years. I believe the chestnut retains its smooth bark longer than any of those which eventually become rough. Some trees, like the hickory, never get rough, because the development of the cork cells begins and ends in a single year, and the bark exfoliates in the form of a thin film. These kinds always have thin bark.

In these and other ways the practical man confirms the concentric ring theory, and is able to assert, with considerable assurance, that the annual rings do mark the age of the tree.

I have found, when heated out by these positive facts, that those who dispute them generally fly to other climes. They do not, they say, behave so in equatorial regions. They may or may not. I find people know so little of what happens in unfamiliar countries, that their failure to know about what is actually before them makes the assertion not worth an argument.—Thomas Meehan, *German Town Nursery, Pa.*, in *Country Gentleman*.

HUGH J. PARK, formerly a well-known mining engineer and at one time a very wealthy man in San Francisco, died at Pomona last week.

The Late Dr. Parry.

[Written for the Press by PROF. J. G. LEMMON.]

Dr. C. C. Parry was most intimately connected with the flora and the botanists of California. Since his early explorations on the coast near San Diego, in 1849, the Dr. has made several brief visits to different regions of the western slope intent upon some special discovery or study. During one visit it was the curious little sand plants, the *Chorizanthe*, that caught his keen eye and secured his careful discrimination. Another visit was devoted to the Alders; another to the *Cacti*, etc.

In 1882 Dr. Parry traveled well over the Pacific Slope, studying the interesting family of *Arctostaphylos* or "Manzanita," publishing the following year, in the Proceedings of the Davenport Academy of Sciences, a monograph which cleared away much of the misconception and ambiguity that bes all along enumbered our botanical literature, by showing that there were several distinct forms mingled in previous descriptions.

A second monograph, read before the California Academy of Sciences June 20, 1887, still further elucidated the subject, and the two

as the winter of 1875-6, when I joined him at Crafon for the exploration of San Bernardino valley and vicinity. From that date a warm mutual attachment has ever existed, and it happens that his last days in California were spent in the quietude of the Lemmon Herbarium, where, overlooking the roofs of Oakland and amid study and social converse, the bonds of friendship were more strongly welded, if that were possible, and the intimate companionship of long years culminating in these brief weeks, confirmed our judgment of the social, genial character and noble qualities of this busiest as well as most modest of men.

The botanists of California and of the whole Pacific Slope learn with profound sorrow that our tireless fellow-worker has ceased laboring with us and taken his first rest; and we turn in deep and tender sympathy to the loved companion who has walked proudly by his side these many years in full accord with his life-chosen work, now left to tread the rest of her journey companionless, and we would bear to her annually, as we study them, the sweet fragrance and tender bloom of the almost numberless flowers that have received their baptismal names from the lips of "Good Dr. Parry."

To Prof. Lemmon's appreciative tribute to the memory of his friend and botanical companion, we need but add a few leading facts in

THE LATE DR. C. C. PARRY.

papers cited complete our knowledge of the California manzanitas, Dr. Parry having detected and described therein six new species, besides determining the proper limits of the other nine.

Later, in 1887 and 1888, Dr. Parry performed like excellent services in the examination of our *Oenothera* family, many species of which form our coast chaparral, while others constitute the valuable forage plants called "teabushes" or "deer brush," on the interior mountainous regions. In two able monographs published February and August of 1889, he has cleared up the mass of confusion in this genus while detecting a half-dozen new species and defining the 26 remaining ones.

Dr. Parry has contributed several valuable articles to the press of this coast, chief of which was a series of sketches of early explorers, beginning with David Douglas. It is greatly to be regretted that he was not spared to continue those articles, as he contemplated, by giving his personal recollections of the pioneer botanists—Torrey, Thurber, Nuttall, Hartweg, Bigelow, Schott, Wright, Silliman, Lobb and others.

Not less successful was good Dr. Parry in making friendships among people of all classes, wherever he journeyed. Genial, witty, cheerful, apt at repartee and hadinage, as he was generous and noble-minded in all discussions, he was always welcomed to every fireside on his busy rounds of discovery.

It was the good fortune of the writer to meet Dr. Parry and his esteemed wife as early

the life of the esteemed scientist. Dr. Charles C. Parry was born in Admington, England, Aug. 28, 1823, and came to this country with his parents in 1832, settling in New York State. He graduated with full honors from Union College and afterward studied medicine, was admitted to practice, but chose rather the pursuit of the sciences, especially that of botany. In 1846 the family moved to Iowa, and Dr. Parry practiced medicine a few months, but the following year began his work as a botanical explorer in the new regions of the great West. This work was continued year after year, much of the time being devoted to official botanical work in connection with the Government surveys, and his territory being the Rocky-mountain region. This work was pursued up to the commencement of his work on this coast, as mentioned by Prof. Lemmon. Dr. Parry left a comfortable property in Iowa, thus providing for his faithful wife who survives him. Dr. Parry's portrait, which appears upon this page, is a photograph from a photograph kindly furnished by Prof. Lemmon.

THE BLIND SELDOM SMOKE.—A peculiarity about the blind is that there is seldom one of them who smokes. Soldiers and sailors accustomed to smoking, and who have lost their sight in action, continue to smoke for a short while, but soon give up the habit. They say that it gives them no pleasure when they cannot see the smoke, and some have said that they cannot taste the smoke unless they see it.

The Coming Census-Taking.

Interesting Information about Methods.

The interesting announcement is made at the Census Bureau that the work of preparing for the coming enumeration of the population next June is practically over, so far as the central management in Washington is concerned. The Superintendent of the Census, Robert P. Porter, has, in fact, got the machinery of the Bureau in such good running order already that he has been able to take advantage of the present period of routine inactivity to go on a ten-days' vacation—getting a breathing spell now that he would probably have been obliged to forego during the busy period of tabulation and computation which will follow the actual gathering of the statistics.

The manner of getting at the number of inhabitants in each State or Territory is simple and effective. The supervisor's district is the unit of the system. The supervisor appoints the enumerators, among whom the work in the district is to be subdivided, and is responsible for their zeal and accuracy. By a provision of the law no enumerator is to be required to look after an subdivision of more than 4000 people, and he is also expected to be a resident of the subdivision and personally familiar with a great number of the families which he is to visit. The average size of a supervisor's district may be guessed from the fact that New York and Pennsylvania have each 11; Ohio and Illinois, 81; New Jersey and Connecticut, 2. Many inequalities occur, however, in the division, according to population, New York City, Kings, Queens, Richmond and Suffolk counties making up together only two of all the 11 in New York State. Massachusetts, similarly, forms but a single district, while Maryland has three districts.

The enumerator is to start out on his inquiry on June 21. If he is to work in a city of more than 10 000 inhabitants, he must finish his canvass in two weeks. If he has a country subdivision, he will not be called upon for a return until the end of the month. The list of questions drawn up for him is given below. With this he must go to each family, and, if possible, get answers from each member of it to all the questions which fit the case.

1. Give Christian name in full, and initial of middle name, surname.
2. Whether a soldier, sailor or marine during the Civil War (United States or Confederate) or widow of such person.
3. Relationship to head of family.
4. Whether white or black, mulatto, quadroon, octoroon, Chinese, Japanese, or Indian.
5. Sex.
6. Age at nearest birthday. If under one year, give age in months.
7. Whether single, married, widowed or divorced.
8. Whether married during the census year (June 1, 1889, to May 31, 1890).
9. Mother of how many children, and number of these children living.
10. Place of birth.
11. Place of birth of father.
12. Place of birth of mother.
13. Number of years in the United States.
14. Whether naturalized.
15. Whether naturalization papers have been taken out.
16. Profession, trade or occupation.
17. Months unemployed during the census year (June 1, 1889, to May 31, 1890).
18. Attendance at school (in months) during the census year (June 1, 1889, to May 31, 1890).
19. Able to read.
20. Able to write.
21. Able to speak English. If not, the language or dialect spoken.
22. Whether suffering from acute or chronic disease, with name of disease and length of time afflicted.
23. Whether defective in mind, sight, hearing or speech, or whether crippled, maimed or deformed, with name of defect.
24. Whether a prisoner, convict, homeless child, or pauper.
- 25 and 26. Is the home you live in hired, or is it owned by the head or by a member of the family?
27. If owned by head or member of family, is the home free from mortgage incumbrance?
28. If the head of the family is a farmer, is the farm which he cultivates hired, or is it owned by him or by a member of his family?
29. If owned by head or member of family, is the farm free from mortgage incumbrance?
30. If the home or farm is owned by head or member of family, and mortgaged, give the post-office address of owner.

Many of the questions, it will be seen, are not intended to be put to all the members of the family visited. From their general scope they are likely to furnish the Bureau with all the information that is needed in the treatment of population and social statistics.

AN EIFFEL TOWER OF ICE.—The Eiffel ice tower completed at St. Petersburg is over 150 feet high, and is composed of 10,000 blocks of ice. The first platform is occupied by a splendid restaurant, and the whole structure is radiant at night with thousands of electric lights, forming a dazzling spectacle.

DURING the month of March there were worked 12,330 tons of Con. Cal. and Virginia ore. The average yield in billion per ton was \$19.96, of which \$10.74 was gold and \$9.22 silver. The average assay of the battery samples was \$24.47 per ton.

IN STAVE-DRESSING twelve co-laborers with a machine can dress 12,000 staves in the same time that twelve workers by hand could dress 2500.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alameda.

CHROME.—Livermore *Herald*, April 11: N. R. Knight is in town this week, and is paying daily visits to the chrome mines. He predicts considerable activity in our mines this season, as there is a good demand for chrome. Mr. Knight and associates are fitting up an old smelting-works building near Melrose with appliances for crushing chrome, it being more acceptable in the Eastern market in that shape.

Amador.

MILL.—*Ledger*, April 12: The mill at the Amador gold mine is about completed. The hitch in regard to the right of way for the car track has not been finally settled, although the terms of settlement have been agreed upon. At the Hardenberg, taking out the water from the shaft is progressing rapidly. For several days it was noticed that while they were taking out large quantities of water the water level in the mine remained stationary. An examination disclosed the fact that the water, as fast as taken out, drained back into the shaft by another opening; as soon as that was fixed the water was lowered fast. A ledge said to be ten feet wide has been struck in the Gardner claim near Irishtown. The ore carries large quantities of sulphures, and shows some free gold. Samples of rock may be seen at Newman's store. Petrie and Tripp are running a tunnel at the Culver mine, near Big Bar bridge. This claim was recently purchased by Mr. Petrie from E. A. Culver.

Calaveras.

WEST POINT.—Cor. Calaveras *Chronicle*, April 12: The mining interest is looming up, and, from the present outlook, it bids fair to make this section of Calaveras lively this summer. The Lone Star is showing an immense body of very rich ore. The Blazing Star hoisting works are nearing completion, and work will be resumed in the mine at an early day. Work is also being vigorously pushed ahead on the Scorpion works and its whistle, too, will soon be calling the miner to his daily toil.

El Dorado.

ACTIVE.—Georgetown *Gazette*, April 12: The general activity prevailing everywhere over the Divide, below the snow line, shows that we have entered upon the most prosperous season that has been experienced for many years. Industry is booming all along the lode from Kelsey up through Garden Valley into Georgetown and into Volcanoville mining district. Slate mountain and Bear Creek are chock full of stir in quartz and placer mining, while the Greenwood seam belt is alive with energy. The Georgia slide seam mines were never more active, and numerous surface diggings are being worked from Georgetown to the snow line. The Onion Valley placers will be worked as soon as the snow permits. Other interests are also taking on new life.

Mariposa.

BEAR VALLEY MINES.—*News*, April 12: Reports from Pine Tree and Josephine mines at Bear Valley represent the development of a large body of low-grade ore as one of the results of the prospecting which has been going on for the last two years in that locality. Mr. Stanley, the mining expert, is making a very thorough practical investigation of the mines upon the grant, and will be able to make an elaborate and intelligent report. There is a strong probability that something more than prospecting will be done during the coming season. This property is in the heart of the mining district. The mother lode runs through it, and outside of that there is a network of smaller gold-bearing veins. Practically, the mining heretofore done has been prospecting, or, as the old Comstock miners would say, "among the grass roots." This will apply to mines at Princeton and Mariposa as well as Bear Valley.

POCKET.—Several very pretty specimens of rich quartz have been brought in from Sebastopol during the past week. They were from the old Hart mine, which some years ago yielded excellent returns. The ore is in bunches, or in other words, it is a pocket mine.

Nevada.

MINING BRIEFS.—*Tidings*, April 12: A small vein of high-grade ore has been cut in the bottom of the shaft at the North Banner. The ledge gives every indication of widening and permanency. Early next week the Omaha Co. will commence hoisting out of the Lone Jack shaft, using water for power. Waste rock exclusively is to be hoisted through this shaft, the quartz to be sent up through the Omaha shaft. Forty-five miners' inches of water are running out of the Peabody drain tunnel. In view of this fact, the pump was not started this week as contemplated. Next week will see the pump in operation, however, and in a few days thereafter the water will again be pumped out, for the third or fourth time this winter. However, there will be no more delays from this source, and sinking will be pushed with all expedition. Nobody would be surprised to hear of a bonanza being uncovered in the Peabody.

DRIFT GRAVEL.—*Herald*, April 12: Capitalists are negotiating for a gravel claim on the Washington ridge which has been developed enough to just prove that a channel has been struck, and the gravel prospects well enough to show that it would pay if properly worked. That ridge has gravel a good portion of the distance between here and Phelps' Hill. There is ground yet unclaimed which offers a good field for prospective work. It is within the range of possibilities that much of it will be located and worked this season. If the San Jose turns out as well as it promised last fall, gravel property up that way will soon command a good price.

YOSEMITE.—*Telegraph*, April 12: The owners of the Yosemite gravel mine feel very much encouraged now at the prospects. The drift is in about 700 feet, and a few days ago an upraise of about 30 feet was made and pipeclay was struck which pitched downward. The lower drift will now be run and it is expected that a short distance will develop a rich gravel lead. The Yosemite is located at Selby Flat, a short distance above Nevada City, and in a region abounding with gold. In the early days an immense amount of wealth was taken from the surface ground on Selby Flat, and there is plenty left. John

M. Thomas of the Citizens' Bank in Grass Valley, and W. D. Harris are the principal owners of the mine.

THE GOLD HILL.—Grass Valley *Tidings*, April 11: The Messrs. Hopkins, George Mainhart and Surveyor Uren went out to the Gold Hill mine this afternoon and took notes and measurements to promote the preliminary work for reopening the mine. A steam plant is to be put on, active operations to commence in a month or less. Later on water-power will no doubt be introduced, and the steam plant retained only for use in cases of emergency. If the Gold Hill does not prove to be the equal of any mine in the district, everybody who knows the history of the property will "lose their guess," as the miners say.

Orange.

BIG COAL ENTERPRISE.—Los Angeles *Express*, April 10: On Monday last a party of well-known citizens of Los Angeles returned from an inspection of a very valuable coal bed in Orange county. There were in the party Col. J. C. Robinson, vice-president of the Los Angeles Cable Co.; ex-Mayor John Bryson, Dr. J. H. Bryant, Supt. E. E. Hewitt of the Southern Pacific Co.; Capt. A. W. Barrett, H. J. Woollocoit, John McCrea and Charles Seyler. The location of the coal bed is in Santiago canyon, about 10 miles east of Santa Ana. The gentlemen made a very thorough examination of the prospect. A tunnel had been run into the hill, and at a depth from the surface of about 16 feet were found four or five blanket veins of very good-looking coal. The intention is to form a joint-stock corporation to open and develop the property. A shaft is to be sunk and all these veins very thoroughly explored. Ten thousand dollars is to be laid out at once in this preliminary work. The corporation will be known as the Carbondale Coal M. Co. A year or more ago D. M. Tomblin, an enterprising resident of Tuslin, exhibited specimens of this coal in this city and exerted himself to interest capital in the development of the property. It is averred that should the enterprise be carried out as now projected the new enterprise will be able to lay down coal in Los Angeles at \$6 a ton.

Placer.

THE DRUMMOND QUARTZ MINE.—*Herald*, April 12: The old-time miner and mining superintendent, Wm. Werry, after the hard winter, has again taken charge of the Drummond quartz mine, near Iowa Hill, and reports everything as looking well. A contract has been let to run tunnel No. 2, in which the ledge is likely to be struck soon. Mr. Werry thinks this lower tunnel will demonstrate the mine's increased value. But even the openings in tunnel No. 1 show the Drummond to be a rich mine and good for years. If they strike good ore at a lower level, so much the better. The intention is to soon have another mill in operation, probably by the 1st of May. There are now about 20 men employed, and when the new mill is started they will increase the force. When in full operation they expect to crush from 30 to 35 tons of rock per day.

San Diego.

BANNER.—Julian *Sentinel*, April 11: As De-maids has departed, I will give you a few items from Banner. The Cincinnati Belle Co. have their new shaft down 80 feet, with a good ledge of ore. They have built a road from the mine to the Cuyamaca mountain, via Bob Gardner's, for timbers, etc. The Ready Relief are running their ten stamps on good ore. The Warlock boys are about to make a deal with Pomona parties for their mine. The Point Loma Co., of the North Golden Chariot, are in 80 feet with their tunnel and expect to strike the ledge at 150 feet; then look out for big reports. Bryan Obeir and Expert Werlitz, of St. Louis, will soon arrive at Banner and will commence operations on the Kentucky.

PINE VALLEY.—San Diegoan, April 10: Coroner Eadon, who has just returned from a trip to Laguna, reports mining matters lively in Pine Valley. "I stopped over at Goodbody's camp at the Eureka mine. They have ten men at work and are taking out a good deal of ore. They have a five-stamp mill, but it is at present idle for the reason that the bed of the crusher is broken, and they are waiting a new one from San Francisco. Another mine is being worked near by."

Sierra.

WIDE AWAKE.—Mountain Messenger, April 12: At the annual meeting of the Wide Awake Mining Co., held in Downville, April 7th, the following named were elected directors for the ensuing year: F. Ensich, J. A. Blohm, C. F. Eckard, P. R. Gardner and J. M. B. Meroux. At a subsequent meeting of the Board of Directors, P. R. Gardner was chosen President, H. T. Briggs, Treasurer, and A. J. Meroux, Secretary. The mine is opened for work and 18 ounces of gold, the first cleanup this season, was washed out this week. Mr. P. R. Gardner will have charge of the property until a superintendent is appointed. Nine men are employed and more will soon be engaged.

THE CLEANUP for March at the Young American quartz mine was about \$15,000.

Sutter.

GOLD DUST.—Sutter County Farmer, April 11: T. S. Kersey of West Butte, a pioneer miner, was in town last Saturday, and brought with him a quantity of gold that he had washed out during the past winter. On his range in the Buttes there are many places containing free gold, and during the rains while water can be procured, good wages can be made with the pick and pan. Mr. Kersey had only worked at odd times, and had secured about \$30 worth of the precious stuff. Some fair-sized lumps of gold were shown in the box containing the dust.

Tuolumne.

RICH ROCK.—Tuolumne Independent, April 12: We are informed that some very rich rock has been discovered in the extension between the Black Oak and Live Oak mines, said to be the richest rock Soudhyville has yet produced. The Dead Horse mine is at present showing some very rich ore.

Trinity.

WORK PROGRESSING.—Trinity Journal, April 12: Last Tuesday the Trinity Gold Mining Co. had 160 inches of water through the lower ditch, and by Saturday evening they expect to have the ditch running full. It will take about four weeks to get the upper ditch ready to carry water, but with water the lower one will furnish good work can be done.

EAST FORK.—The Enterprise mill is running in good shape. Yesterday the Yellowstone started up,

and is running day and night. Mr. Paxton has quite a force of men at work, having three shifts on the lower tunnel. Smith and Watrous are having a good run this season, and judging from the muddy water in East Fork they must be moving considerable dirt. Prospectors are commencing to move around through the mountains, and some assessment work is being done.

NEVADA.

Washoe District.

POTOSI.—Virginia Enterprise, April 12: The east crosscut, 300 feet south of north line, 850 level, is out 196 feet; face in porphyry with streaks of quartz which give good assays. East crosscut 400 feet south of north line, 850 level, is out 158 feet; face in porphyry. The winze below the 930 level is down 43 feet; the bottom is showing stringers of ore of good grade. The raise above the 930 level is up 85 feet; the roof is in quartz giving assays of from \$25 to \$40 a ton.

ALTA.—Are working in the stopes between the 925 and 825 levels and drifting southeast on the 1040 level; face of drift in low-grade ore. Milling about 45 tons of ore daily, of the average value of \$20 per ton.

YELLOW JACKET.—Shipping about 65 tons of ore daily of the average value of \$22 per ton, and doing extensive prospecting work.

CON. IMPERIAL.—West crosscut No. 2 from the 500 level north drift (Yellow Jacket), which is the 750 level of the Imperial, is out 238 feet, having been advanced 30 feet during the week. The north lateral drift in No. 1 crosscut on the same level is in 115 feet, 20 having been added during the week. The face shows quartz and porphyry.

CROWN POINT.—Have started to open the old west crosscut on the 230 level and to advance it over the 300 level west stop. Shipped to the mill during the week 787 tons of ore, the average battery samples of which assayed \$24.52 per ton.

BELCHER.—The 200 south drift from the west crosscut is out 175 feet, having been extended 40 feet during the week. The face is in low-grade quartz. The 300 west crosscut is out 65 feet. The face is all in quartz showing spots of pay ore. The 600 south lateral drift is out 217 feet, having been advanced 15 feet since last report. The 800 joint crosscut is out 323 feet, and the face is in hard porphyry.

CONFIDENCE AND CHALLENGE CON.—The joint Confidence and Challenge raise is up 18 feet, having been commenced during the week. The top shows low-grade quartz.

OVERMAN.—Have extracted and hoisted from the 1200 level 213 tons of ore. Shipped to the Vivian mill 283 tons of ore. Battery average, \$18.02 per ton; of this amount \$10.04 is gold. Stopes are looking well and yielding the usual quantity and quality of ore. Shipped one bar of bullion valued at \$7372.97; previous shipment, \$6336.49. Total for the month of March, \$13,709.46.

JUSTICE.—The north drift, 622 level, advanced 18 feet; total length, 770 feet. The face is in low-grade quartz. The southwest drift, 490 level, advanced 10 feet; total length, 563 feet. The face is in hard rock. Shipped to the mill during the week 196 tons of ore, the average battery assay of which was \$26.10.

SEGREGATED BELCHER.—The 1000 level south-east drift is out 103 feet south of north line, and they have connected with the end of the east crosscut. The 850 level joint crosscut is out 323 feet, having advanced 28 feet since last report. The face is in hard porphyry.

CHOLLAR.—The east crosscut, 80 feet south of north line, 750 level, is out 110 feet; face in porphyry. The east crosscut, 80 feet south of north line, 850 level, is out 115 feet; face in porphyry.

EXCHEQUER.—The east crosscut on the north line, 500 level, is out 167 feet; face in porphyry. The north lateral drift, 600 level, is out north of Alpha shaft 227 feet; face in quartz and porphyry.

ALPHA.—The west crosscut, 500 level, 100 feet north of shaft, is out 547 feet; face in hard porphyry. The south lateral drift, 600 level, is out 19 feet; face in soft porphyry and stringers of quartz.

SAVAGE.—On the 300 level the south and north lateral drifts are advanced respectively 159 and 84 feet. Are extracting ore from the 400, 500, 600 and 750 levels, and are running prospecting drifts on each of these levels. During the week they milled 459 tons of ore of the average value, as per battery samples, of \$22 per ton. Have bullion on hand amounting to \$6304. The total bullion yield of March was \$28,855.65.

SCORPION.—On the 630 level the southwest drift from the shaft has been advanced 60 feet in a porphyry formation.

HALE & NORCROSS.—No work has been done in the mine since last report up to Wednesday, when work was resumed, except timbering the shaft and repairing the south lateral drift on the 500 level, both of which repairs are completed. Have started No. 1 east crosscut from the south drift on the 500 level, and advanced it 20 feet. It is hoped to encounter in this crosscut the northern continuation of the ore recently disclosed in the Chollar drift near the Hale & Norcross south line. Milled during the week 280 tons of ore of the average value, as per battery samples, \$20 per ton.

SILVER HILL.—The south drift from the shaft, 160 level, is out 545 feet; face in clay and porphyry. The northeast drift, 260 level, is out from the shaft 650 feet; face in clay and porphyry. During the week have been repairing the 400 level station.

WARD COMBINATION SHAFT.—The east drift from the 1800 level station is out 314 feet; face in porphyry.

JULIA.—No work has been done in the northwest drift the past week except repairs.

CON. NEW YORK.—The west drift from the shaft, 650 level, is out 250 feet; face in porphyry. The north lateral drift, 800 level, is out from the west crosscut 203 feet; face in clay and porphyry. The raise from the 800 level is up 214 feet; the roof is in quartz giving fair assays. The south lateral drift, 950 level, is out from the shaft 133 feet; the face is in quartz giving low assays.

BEST & BELCHER.—On the 1000 level, east crosscut No. 1 has been extended 22 feet; total length 327 feet. Formation, hard porphyry. On the 1200 level the north drift has been cleaned out and repaired 40 feet; total distance, 570 feet.

GOULD & CURRY.—On the 200 level west crosscut No. 1 has been extended 18 feet; total length, 134 feet. Formation, soft porphyry. On the 400

level west crosscut No. 1 has been extended 18 feet; total length, 560 feet. Formation, soft porphyry.

ANDES.—Drift on 420 level advanced 70 feet. Formation, clay and porphyry, with stringers of quartz. On 350 level still advancing repairs.

Central District.

GOOD PROSPECTS.—Cor. Silver State, April 11: Central district, which, like most of the mining camps in the State, has been dormant ever since silver was demonetized, is now coming to the front again. Lately some very rich mines have been developed and large bodies of ore have been found at a considerable depth, which are very rich in gold and silver, and will soon be sending forth a large output of bullion to the markets of the world and adding to the many industries of Humboldt county. The following are a few of the leading mines in the camp: The Locomotive, owned by Frank Clark, and perhaps the oldest and most developed mine in the camp, has been running steadily for a number of years. Considerable work has been done and the mine has paid its owner from the grass roots down. The Aurum, owned by Clark & Stodding, is one of the richest mines in the camp. At a depth of about 150 feet a body of ore was discovered which is from 18 to 20 inches wide, and averages about \$700 in gold to the ton. The ore also carries very rich galena, which ranges from \$125 to \$200 in silver to the ton. The mine is rapidly being developed and is one of the best prospects in Humboldt county. The Millionaire, owned by A. H. Ruse & Son, is also a rich property, and is being worked at a depth of 200 feet with a large body of ore in sight, which is very rich, and ranges about 18 to 30 inches in width and assays very high in gold and silver. At present they have no way of hoisting the ore and have to stow it away in drifts in the mine, but the owners expect soon to have a whim in operation. The Railroad, owned by Norman Gilbert, is another good mine, and is developed to a large extent and has an immense body of ore in sight. The Keystone, owned by Alex Wise, is another on the list of good mines in the district and has rich ore in sight. It is expected this mine will be worked this summer. Frank Reynolds is running a tunnel to tap a ledge, which prospects good on the surface, and he expects to strike ore shortly, as indications show that it is not far off. He has already cut several small seams of ore in the tunnel, which is now in about 125 feet from the surface. Quite a number of prospectors are in the hills, and it is probable that other good leads will be found before very long. The camp has quite a lively appearance, and it is the hope of everybody that it is on the verge of a boom.

Bureau District.

SURVEY AND EXAMINATION.—Sentinel, April 12: Gen. Robt. M. Clark arrived here from Carson last Tuesday and has been examining the Prospect mountain tunnel and Colorado mine, with a view of ascertaining if the ore that has been extracted from the tunnel and workings has come from the Colorado ground or not. Surveyor Read has been surveying the Colorado mine and the tunnel for the same purpose, as well as to ascertain what amount of ore has been extracted from the Colorado ground. What the result will be we cannot foretell, but steps will probably be taken to prevent the Tunnel Co. from taking ore from any of the mines the tunnel penetrates that they do not own. It would be a good thing if the owners of those mines, and the Prospect Mountain Tunnel Co., would agree to a compromise, and better still if all of them were consolidated. There are several good mines that could be worked through the Prospect mountain tunnel, principally the Silver Connor series, Williams series, Colorado, Avon, Manhattan, Pentier, and Cosmos. If all of these mines were consolidated with the tunnel, which has penetrated the mountain for a distance of 2350 feet, it would make a very productive and a great and valuable property, particularly if it were to fall into the hands of a big incorporated company. The mines mentioned have yielded a large amount of ore, and there are all the evidences of great value and permanency in them. General Clark returned to Carson yesterday.

SHIPPING ORE.—We learn that ore in considerable quantities is being mined by the lessees of the Bullwhacker mine, owned by the Ruby Mining Co. (Limited), and shipped to Salt Lake for treatment. It is quite remunerative on account of the high percentage of lead it carries. The entire amount of ore shipped over the railroad during the week from the following mines was 43 carloads. Twenty-two cars loaded with ore from the Jackson, Phoenix and Bullwhacker mines, pulled out of the railroad depot last Wednesday, destined for Salt Lake City.

Tuscarora District.

NEVADA QUEEN.—Times-Review, April 12: North gangway from 600-foot station of North Belle Isle has been advanced 24 feet. A strong flow of water is coming in.

NAVAJO.—Crosscut from the end of south drift, 150-foot level, extended 16 feet. The crosscut from the north gangway, 350-foot level, extended 23 feet; total, 44 feet. No material change since last report.

NORTH BELLE ISLE.—The stopes above the 300-foot level are without material change. North gangway from the shaft, 600-foot level, has been extended 24 feet. The water is coming in pretty strong.

BELLE ISLE.—The crosscut near the Navajo line, 250-foot level, has been extended 8 feet, cutting some low-grade ore. A drift has been started north from the crosscut and extended 6 feet. South drift from crosscut on the 350-foot level extended 13 feet.

GRAND PRIZE.—500-foot level: East drift from north crosscut extended 9 feet without change. North crosscut from front vein extended 21 feet. Have passed through the north vein. A drift is started east upon the vein; the face is in concentrating ore of fair grade.

DEL MONTE.—First level—North gangway has been advanced 27 feet, total 98 feet, spar and iron pyrites showing in the face. North drift from joint crosscut extended 10 feet, seams of high-grade ore all through the face of drift.

COMMONWEALTH.—We have sent 520 tons of ore to the concentrator, which is running all right; 110,200 pounds concentrates on hand, weighed as taken from the vanners.

NORTH COMMONWEALTH.—First level—No. 2 east crosscut has been extended 15 feet through the vein, showing some good ore. North drift from

No. 1 east crosscut advanced to feet and connected with south drift from joint crosscut. Have started to drift east from this point.

ARIZONA.

NOTES.—Prescott *Courier*, April 11: Word from Bradshaw district is to the effect that the Gray Eagle mine is being opened in a workmanlike manner and is looking well. Both mills are running. Mr. Williams, superintendent of the Boggs, Hackberry and Senator mines, is opening all three mines in the right way. Water is still a troublesome element in the Senator. The Congress mill, which has run night and day for ever so many months, is now getting a thorough cleaning. Supt. Giroux thinks of starting United Verde smelters early next week. Several sales of undeveloped lodes have been made this week. Several wagon-loads of gold sulphurets came here yesterday from the Congress mine. T. W. Boggs of Big Bug district said recently that there are some 60 men working in and about the Hackberry and Boggs mine. The vein in the last named mine is very large. N. C. Sheekles of the Crowned King mine arrived here recently from the mill, which is running and paying. The company's most refractory ores are shipped East. Wm. Murphy has taken men to Bradshaw to work in Wm. A. Linn's fine claim on the Tiger. The Black Horse mine continues to improve as depth is attained. The old Farnham mill, Walker district, is running day and night, mostly on custom ore. Foster & Robeson have started work in the Middleton mine, Walker district, and will commence shipping ore. Miners are talking a great deal about the rich strike in the Hackberry mine, Big Bug district. Frank McCabe's mines, near Glendale Gulch, are producing high-grade ore. N. L. Griffin, J. W. M. Moore and a good many more Walker district miners are sending ore to Joe Chambers' mill. Placer miners of Black Canyon creek are sending in considerable dust to Cordes and Bumblebee stations. Mr. Williams, manager of several mines in this section, has gone to Yucca, Mohave county, to start work in his copper mines, which means that he will, ere long, be smelting in Copper Basin, 13 miles from Prescott. Harlan's mill, on Hassayampa creek, is crushing out the gold. The Congress mill has been overhauled and is working away with usual good results. Miners of Tip Top district are shipping a great deal of high-grade silver ore to the smelter at El Paso, Texas. Jake Henkle is commencing to ship rich ore from his Rapid Transit mine, Bradshaw district. Santa Maria mines are attracting attention. Charles Bennett is opening a promising ledge in Groom Creek district. Turkey creek miners are praying for the water to recede. It is too much for them. J. W. O'Bryan will install new life into Placeritas district in a short time. It is well enough to remark every once in awhile that failures here are not chargeable to Arizona or Arizonians. They can honestly be charged up to detailed "superintendents" who had more money than mining brains.

COLORADO.

THE BUSHWICKER.—Aspen *Times*, April 10: The Bushwick management has met with much difficulty during the past few days in getting the ore from the mine down the mountain. It might be supposed that the Smuggler mountain road would be in a passable condition by this time, but such is not the case, the road on top of the mountain being extremely boggy and at other points rough and unsafe. Seven wagon-loads of ore that were loaded Monday did not get into the samplers until yesterday afternoon. In the meantime the product of the mine has been piling up on the dump and it has been determined to transport the ore by jack train until such time as wagons can again make the trip. One hundred and sixty jacks were sent to the mine yesterday and brought down 25 tons of ore. This ore is of the usual high grade, ranging from \$100 to \$200 per ton. The mine is continually improving in appearance and it looks now as if shipments of 35 or 40 tons a day would soon be possible. When it was found recently where the main ore body lay, the second level north was started to reach it on its downward trend. This level is just coming into mineral and it is believed that the rich ore chute will soon be showing up at that point. If this expectation is realized the management will be assured of several hundred thousand dollars' worth of mineral between the two levels.

IDAHO.

SMOKY—Ketchum *Keystone*, April 7: We are informed that the outlook of the Smoky mining district is very encouraging. Our informant says that the Carrie Leonard and Pot Wrestler mines, which are being worked under a lease, have not looked as well for the past three years as they do at present. The prospects of the Fraser mine, owned by the Philadelphia and Idaho Co., are looking very flattering, and the number of miners will no doubt be considerably increased as soon as the roads will admit of getting in supplies to the mines. A few men have been working at the King of the West mine during the winter, and it is reported that this mine never looked better or more promising than at present. Arrangements are being made by which the miners of Smoky expect to make shipments of ore in the course of a couple of weeks. They will use pack-trains until the roads become passable for wagons. The prospects of the entire Smoky district for a prosperous season are exceptionally bright. An important development is reported in the lower works of the Red Elephant mine at Bullion. The ore body is said to be six feet wide.

SEAFORD MINES BONDED—Challis *Messenger*, April 8: The Eureka, Midway and Ella and a two-thirds interest in the Big Sulphur mines, Seaford district, have been bonded by Messrs. Mat Womacks, Lee Womacks, Carl Laue, D. W. Clum and Henry Duffy to C. E. Keller of St. Paul, Minn., through his agent, Wm. J. Scott of Challis. The bond is for five months. These properties are all developed, the Eureka the most extensively, and ore has been shipped from them to Ketchum which averaged about 135 ounces per ton, the lowest being 110 ounces and the highest 150 ounces per ton. These properties are considered by all miners of Seaford to be among the best locations of that rich district, and conservative mining men who have examined them thoroughly think that with full develop-

ment they will rank with the first mines of the other permanent districts of Custer county.

MONTANA.

CHAS. CLARK'S PURCHASE.—Phillipsburg *Mail*, April 12: Charles Clark, of Granite Mountain, took up the deed in escrow in St. Louis, Saturday, of the Harris & Hazleton group of mines in the Beaver creek district and paid the purchase price in cash, \$75,000. These mines, it is said, have paid the owners \$10,000 per month net, for several months past.

GRANITE MOUNTAIN.—The output for the week ending April 10 was 51 bars of bullion, containing 79,585 ounces fine silver and 155 ounces fine gold.

NEW MEXICO.

DEVELOPMENT WORK.—Silver City *Enterprise*, April 11: James Smith and John Stone have been working out some excellent ore at Bald mountain. Wm. Brahm contemplates the erection of a silver mill at Lone mountain in the near future. He will treat custom ores. Wm. Beall and Col. Dan Casey are drifting from bottom of shaft on the Only Show mine in Cow Springs district. The boys are taking out some very fine chloride ore with considerable in sight. Iron ore is now being shipped from Legal Tender hill at the rate of two cars per day. George W. Wearing, of Deming, states that the building of the new road from Deming means the early completion of the new smelting plant upon which he has been working for the past year. The completion of the smelter at Deming will be of great advantage to many mines in this section of the county, and especially to those of Pinos Altos, which produce low-grade concentrates. And still they come to the front. The new strike on the Oseola mine, the north extension of the Deep Down in Atlantic gulch, is something over which mining men in other mining States would rave and newspaper correspondents warm the wires. In a drift run from the 60-foot level, there has been discovered a body of ore over 12 inches in thickness, which is sprinkled, pepper and salt fashion, with free gold throughout the entire mass; an average of over 12 inches assaying 33 ounces of gold per ton. The talcose vein matter adjacent thereto for a width of 18 inches, running from three to five ounces in gold per ton. The owners, Messrs. Martin Cox and Jake Long, are very much elated. The recent strike in the Alhambra at Black Hawk is probably the finest body of ore ever developed in this district. It is without doubt the most extensive chute of native silver ever uncovered in the Territory. The drift has now been driven over 20 feet along on the ore body and only the apex of the ore chute has been uncovered, yet the ore is so exceedingly rich that over \$20,000 is now exposed in sight, with an underhand stope of virgin ground to be explored.

OREGON.

HYDRAULIC COMPANIES.—Grant's Pass *Courier*, April 10: The four hydraulic mining companies on Williams creek, viz: Elick Watts, Bigham & Co., Sparlin & Co. and J. T. Layton & Co., are all running with plenty of water in pay dirt. The Pacific Hydraulic & Gold Mining Co., on Grave creek, are working two pipes night and day. The high water damaged their mine considerably by washing out two bridges, otherwise they would have had six pipes playing on pay dirt. The Grant's Pass Mining & Lime Co. are operating on their time claim, three miles east of Woodville on Ward's creek. They have burnt one kiln of 850 bushels, and from this time on will burn six kilns every four weeks. They expect in the near future to construct a Put kiln with which they will burn 100 barrels of lime per day; this will require an expenditure of over \$3000. This is one of the best lime quarries on the coast. Long years ago a couple of miners struck quartz on Horseheaven creek, a tributary of Williams creek. Patiently they toiled in developing their ledge, and after working down on the ledge, to further demonstrate the richness of their find, they started a tunnel from the face of the hill many feet below. With common black powder and drill they penetrated the hill some 60 feet, but failed to find their ledge which gave such rich promise higher up. Vainly they run side drifts, no ledge could be found, and after years of toil and the utter depletion of their money they abandoned the mine. A third of a century rolled away. Rubbish and a tangled growth of wild weeds and underbrush had obliterated all signs of the work these men had done. The mine was forgotten, and even tradition failed to note its locality. The flood of 1890 came; the saturated hillside lost its hold on the long-hidden bedrock, and with a roar and a crash it came down. But there was no one near to hear the uproar made by the falling mountain-side, for it was far out in the peopleless mountains. Recently Mr. S. Messenger happened in the vicinity of the old forgotten mine, and going to it, found that the landslide had completely denuded the face of the hill, revealing a well-defined ledge, and also how near, bow very near, the disheartened miners had come of striking the sought-for ledge. By a strange freak the ledge had veered from its indicated course, and by a very few feet the miners of long ago missed it. Mr. Messenger is an experienced quartz miner, and after fully testing the rock is satisfied it is good. He is now preparing to work it. It is free gold, and one or more arastras will be put to work on it right away, the machinery for which is now ordered.

UTAH.

GRAPHITE.—Eureka *Chief*, April 11: A large body of graphite has been discovered near Santaquin. The Victoria Mining Co. have a force of men at work on their claims near Silver City. Quite a number of new dwellings are being put up at Silver City and Mammoth, and the people of these rich camps look forward to a season of growth and prosperity. The fine weather of the past few days has caused the feet of the prospectors to itch, and many are striking off into the mountains and canyons in search of pay dirt. Since the strike of ore in the mountains beyond Homansville, the houses there so long vacant are again being occupied, and where bats and the festive coyote have so long held sway is now the scene of hopeful activity. Ed Brim accidentally discovered a body of mica near Silver, Thursday.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING APRIL 8, 1890.

- 425,365.—SNOW EXCAVATOR—D. R. Bier, Woodinville, Wash.
425,206.—BRAKE BLOCK—Butts & Edmonds, San Diego, Cal.
425,207.—RAILWAY RAIL JOINT—E. J. Byrne, Ft. Bowie, A. T.
425,122.—SAIL—John Cook, S. F.
425,126.—CARRIAGE TOP LIFTER—Jas. T. Dy-sard, Lakeport, Cal.
425,166.—CAR COUPLING—C. F. Francisco, San Diego, Cal.
425,169.—STEAM ENGINE VALVE—Wm. Gehring, San Diego, Cal.
425,174.—OPERATING ELEVATOR GATES—F. N. Hallett, Portland, Or.
425,386.—SAW MILL SET WORKS—R. E. Nevin, S. F.
425,106.—ELECTRIC ROTARY PUMP—E. I. Nichols, S. F.
425,349.—SPRINKLER—Jos. Oswald, S. F.
425,146.—REVERSIBLE WINDOW SASH—Reguin & Kingston, S. F.
425,085.—SAW GUIDE—T. Roberts, Eadonia, Washington.
425,110.—MARKER, ETC., FOR STONE WORK—Eliza K. Smith, S. F.
425,151.—TURNTABLE—J. C. H. Stut, S. F.
425,196.—SAW SWAGE—Wheeler & Newhouse, Corvallis, Oregon.

The following brief list by telegraph, for April 15, will appear more complete on receipt of mail advices: California—Cullen B. Bingham, Volcano, ore feeder; William H. Birch, assignor of one-half to C. J. Kaighin, S. F., sleeve; Thomas A. Evans, S. F., electric railway; Robert Franklin, Pomona, hose coupling; Windfield S. Getchell, San Jose, and R. E. French, Oakland, packing for stuffing-boxes; George Harvey, Forestville, stump-puller; John D. Hooker, Los Angeles, means for coating metal pipes; George O. Kohler, S. F., hose-hall gloves; Stillman A. Moulton, Campbell, tray for drying fruit; Louis Shafter, Oakland, ventilating outlet for refrigerator chambers.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MOLD FOR MAKING CONCRETE CONTINUOUSLY.—Ernest L. Ransome, S. F. No. 424,656. Dated April 1, 1890. This invention relates to an improvement in the manufacture of concrete molds for sub-ways; and it consists essentially of a continuously-moving mold about which the concrete is constantly tamped while it is in motion. In a former patent, too, the same inventor is shown a mold adapted to be moved forward to a certain point and to remain stationary while the material is being tamped and compacted about it, after which the mold is loosened and again moved forward and again expanded after it has reached the point where the next section is to be completed. Mr. Ransome has found by experience that if the mold is moved continuously at a slow rate of speed while the work is being carried on, and without any contraction of its side for this purpose during the progress of the work, a great improvement in the work is produced. By the improved method, as the concrete is filled in and compacted, the friction caused by drawing the mold over and through the concrete serves to smooth it down, producing altogether a very superior and more finished result; and as no delays are necessary to move the mold and set it again for its work, it will be manifest that the work will be greatly accelerated and cheapened.

AUTOMATIC CABLE LIFTER FOR CABLE RAILWAYS.—John C. H. Stut, S. F. No. 424,532. Dated April 1, 1890. The invention relates specially to those devices which are used for raising the cable into the jaws of the grip of cable cars. Ordinarily, when the car is running, its stop is made by releasing the cable from the clamping effect of the grip but without dropping the cable from the jaws; but at certain localities—at turn-tables, the termini of the road, and at crossings—it is necessary to cast out the cable from the jaws, so as to wholly disconnect the grip, and it then becomes necessary when the car is to start again to lift the cable up into the jaws of the grip. It is the object of this invention to provide a simple and effective automatically operating device for raising the cable, and to this end the invention consists in a lifting roller mounted in the tube or tunnel under the cable, a lever in the tube and traversing the line of the grip-slot, so that as the grip passes the lever is thrown to one side, and suitable connection between the lever and the roller whereby the roller is raised to lift the cable into the jaws of the grip.

TURNTABLE.—John C. H. Stut, S. F. No. 425,151. Dated April 8, 1890. This invention relates to an improved construction for turn-tables which are specially applicable for use upon cable railways where it is necessary to transfer a car from one track upon which it arrives at the table to another track upon which it is moved in another direction after leaving the table. The object of the invention is to provide a turning-table so shallow in depth that it will allow the endless traveling cable to pass beneath it without change of direction while

a slotted tube or tubes are huilt into the top of the table, so that the grip may pass through after letting go the cable. By building the table of angle-iron or steel girders and top and bottom plates, and nailing the girder with the tubular channel which extends across the table, and forming the bottom of the channel in a peculiar way, the inventor is enabled to make the table very thin and strong and to build into the table the tubular channel or channels through which the grips and grip-shanks may pass when disengaged from the cable, while the latter is allowed to pass below the table without any change of direction from its ordinary line of travel.

SAIL.—John Cook, S. F. No. 425,122. Dated April 8, 1890. The essential object of this invention is to provide a sail of increased capacity and at the same time so constructed and arranged as to place the center of the wind force at as low a point as possible, whereby the greatest stability is given to the boat and the danger due to a sail of great dimensions avoided. This sail has the general configuration of an elongated parallelogram, differing therefrom only in a slight convergence of the sides of the sail forward, so that it is a little narrower at its forward end. There is a boom or spar at both top and bottom, and braces or stretchers separate these spars. These stretchers converge near the mast and the ends are secured upon an eyeholt from which a line leads down to the foot of the mast. By pulling upon this line, the stretchers are pulled in toward the mast, thereby straightening them and raising the upper boom or spar, keeping the sail tightly stretched. The pivotal connection of this sail with the mast enables it to be turned at right angles in front of the mast, when the boat is sailing before the wind or at any angle when the boat is beating or tacking. The stretchers or braces keep this sail very flat.

SAW-MILL SET WORKS.—Robert E. Nevin, S. F., assignor to the Vulcan Iron Works, No. 425,386. Dated April 8, 1890. This consists in the combination, with the carriage, of oppositely rotating ratchet-wheels connected, respectively, with pinions whereby the setting-gear is moved constantly in one direction, a lever and pawls whereby the ratchet-wheels are moved, stops by which the movement of the lever and the amount of set is regulated, and foot-levers and mechanism for operating the stops, and a means whereby the pawls may be thrown out of engagement with the ratchets.

Mining Share Market.

The mining share market has been active throughout the past week, with Chollar and Potosi the leaders on a break-neck down move. The whole market, like a kite's tail, moves in sympathy. Those of our patrons who took warning from our last week's remarks that although "this is a growing market yet there would be setbacks and, at times, in the leaders decided breaks," and sold out, did well. This opinion we still adhere to. It is based on important work now going on in the mines. The decline the past week was engineered by the pool through well-distributed cross-orders. While crossing orders to put prices down, they had brokers quietly taking in every share of actual stock offered for sale, paying higher than was bid. The pointers, as usual, worked the street to sell. Yesterday (Wednesday) the market closed very weak, but this morning it opened strong at an advance. After the regular Call, prices were still higher, with some stock, marking an advance of \$1 a share over yesterday's closing prices. Chollar and Potosi are still in the lead. The outside stocks are dull, with no trading of consequence reported in them.

It is now claimed that a gentleman who has disposed of his interests in the late Alaska Fur Company has joined the Comstock pool, throwing, so it is said, his interest with the north-end manipulators. From the mines our advices report that in the Potosi winze they are in high-grade ore on one side, with porphyry on the other side. The assay goes higher than was reported by Mr. W. E. Sharon and Co., Boyle when they inspected the mines last week. They reported two feet of ore assaying \$100 a foot. They also said that from appearance, with more work, the find might lead into a large body of rich ore. In Chollar there is an improvement. In Con. Imperial important work has been commenced, which this week's letter does not mention. This probably accounts for the five-cent assessment on the stock. A few months ago the company took out ore which they milled to test its quality, confirming our statement that on the upper level they had run into a ten-foot ledge of good to rich ore. Private advices state that in the Challenge-Confidence joint work now going on they ran into ore going over \$50 a ton. Official letters received from the two mines report that in the raise from the 300-foot level and the raise from the 500-foot level they are in good ore.

Our advices report a general improvement in the Gold Hill mines, although Crown Point's official letter reports the pulp assay the past week over \$4 a ton less than for the preceding week. Belcher reports being in ore on two levels. Our advices from the North End mines are of the most encouraging character. A Virginia City contemporary says: Already sufficient has been revealed in Ophir, Chollar, Potosi and Overman to revive such interest in the Comstock lode as will enable the energetic prosecution of work for another two years in the mines, during which time we may reasonably hope to strike other ore bodies. The work of draining the Gold Hill mines is another important factor in interesting speculators in mining. By draining those mines to the 2200 level a block of rich mineral ground, where-in very little prospecting has been done, 800 feet deep, 700 feet wide, and nearly a mile in length, will be added to our resources.

A TINY HOUR GLASS containing gold-dust instead of sand is the latest pendant for a chain.

MECHANICAL PROGRESS

The Future of Nickel Steel.

Some most remarkable statements, of great interest to the steel trade, were recently made by Mr. S. J. Ritchie, the well-known head of large American copper and iron interests in Canada. We cannot do better than reproduce them substantially as given:

"Within the last year nickel has come to assume a very important place in metallurgy as an alloy with steel. These results have been obtained in Great Britain, in France and in Germany. In France the cartridge shells are made of an alloy of equal parts of nickel and copper. In Great Britain large guns for the navy are being made of an alloy of nickel and steel. This has also been done in an experimental way in Germany, but heretofore and before the discovery of nickel deposits in Canada, the supply of nickel was so small and the price so high it would have been impossible to supply any considerable want, even had its utility been known. The Iron and Steel Institute of Great Britain is composed of the most prominent manufacturers of steel, both in Great Britain and upon the Continent, and it has at its meetings many American manufacturers. The discussions at its annual meetings represent the best talent and skill in everything pertaining to iron and steel that is to be had in the world, and its conclusions are the highest authority to which we can appeal.

"About one year ago this institute appointed one of its most competent members, a manager of the Steel Co. of Scotland, to make an extensive series of experiments with this alloy. This he did, and reported the results of his efforts to the meeting of the institute held in London May 8, 1889. The report has attracted the attention of steel manufacturers all over the world. No result approaching the high elastic limits and breaking strain of those reported from this alloy had ever before been seen. I myself saw a piece of this steel, made by the house of William Jessup & Sons of Sheffield, which contained about six per cent of nickel, and which was one inch square, that sustained a weight of 103 tons, and also showed a high elastic limit. These results were so wonderful that parties in Europe, who manufacture guns and armor plates for the three principal Governments, have offered to contract for our companies' entire production for a period of ten years. The proportions of copper and nickel in the ores belonging to our companies are just about those used by the French Government in the manufacture of cartridge shells. The proportions of iron and nickel are about what are used in nickel-steel, which it is proposed to use in the manufacture of guns and armor plate."

It is understood that Mr. Ritchie last summer visited the principal iron and steel works of Great Britain and the Continent, and that the above statements are based upon actual investigations. Certainly his statements indicate early and most important developments in the steel industry.

Amount of Friction Between Different Bodies.

One of the plainest statements in regard to this matter is given in one of Grimshaw's "Handy Little Books for Practical Men," about in the following terms: The ratio obtained by dividing the entire force of friction by the normal pressure is called the co-efficient of friction. Hence we may define the unit, or co-efficient, of friction to be the friction due to a normal pressure of one pound. In accordance with the above definition, then, the following values of the co-efficient of friction for different surfaces in contact have been established (the higher the numerical value of this co-efficient, the greater is the friction):

CO-EFFICIENTS OF FRICTION.

Iron on oak	0.22
Cast iron on oak	0.19
Oak on oak (fibers parallel)	0.48
Oak on oak (crossed)	0.10
Cast iron on cast iron	0.15
Wrought iron on wrought iron	0.14
Brass on iron	0.16
Brass on brass	0.20
Wrought iron on cast iron	0.19
Cast iron on elm	0.19
Soft limestone on same	0.64
Hard limestone on same	0.38
Leather belts on wooden pulleys	0.47
Leather belts on cast iron pulleys	0.28
Cast iron on cast iron (greased)	0.10

Pivots or axles of wrought or cast iron on brass or cast-iron pillows:

1. When constantly supplied with oil.....0.05
2. When greased from time to time.....0.08
3. Without any application.....0.15

To TEST ENAMELED IRONWARE FOR LEAD, take ordinary vinegar, which dilute with four times its weight of water, and to which add five per cent of table salt. The solution is poured into the vessel and left in it for 12 hours at ordinary temperature. At this time the liquid is examined for lead by means of sulphide of ammonium. If the liquid acquires a black or dark-brown color, the enamel is dangerous; if the color is only light-yellow or light-brown, the vessels may be used.

BRONZINO IRON OR STEEL.—Some German artists have introduced a method of bronzing iron or steel surfaces in such a way as to prevent the possibility of rust. The object to be acted upon must be free of all oxidation or other impurity, and is exposed for two or three

minutes to the vapors of a heated mixture of hydrochloric acid and nitric acid, in equal proportions, at a temperature of from 550° to 650° F. After cooling, the objects are rubbed over with vaseline and again heated until the vaseline begins to decompose; this treatment with the vaseline is repeated once. Should a lighter coloring be desired, it is produced by mixing acetic acid with the other acids.

A NEW KIND OF WATER PIPE, which has recently been put upon the European market, is described in a German journal. The pipes are made of glass, about 0.2 inch thick, and have an asphalt coating about 0.4 inch thick, with fine gravel on the outside. The purpose of the asphalt coating is to prevent fracture of the pipes. The latter are designed to supplant wooden, earthenware or cement pipes, and also lead and iron service pipes, the advantages claimed for them being thorough resistance against the moisture in the ground, and against the action of acids and alkalis. They are, moreover, impervious to gases, and are claimed to afford little opportunity to the formation of incrustations. What results the pipes will give in practice remains to be determined. Glass pipes have been made in this country; but the asphalt covering is something new, and no doubt a very great improvement.

STEAM TRAMWAYS ON CITY STREETS.—Steam tramways are very common in English cities, but do not meet with much favor in this country. They are speedy, emit neither smoke nor steam, run noiselessly, and altogether give general satisfaction. The engine and boiler is of an ordinary type and is hoisted in. The exhaust steam is condensed by being passed through about 300 copper tubes on the roof of the engine, the water of condensation flowing to a feed-tank and is pumped, still hot, into the boiler. Coke is burned, the average consumption being 10 to 15 pounds per mile, and the total working expenses, including wages, depreciation of engines and other items, are 8½ cents per mile.

TEN-WHEELED LOCOMOTIVES.—The Baldwin Locomotive Works are to build for the Erie Railway Company three more of the large ten-wheel passenger locomotives of the same type as those recently built for that road. The *Railroad Gazette* says these engines represent the heaviest class of passenger motors in service, and their use increases the belief that the six-wheeled coupled locomotive will be the engine adopted for heavy express service in the near future. These locomotives have 20 by 24 inch cylinder, 65-inch drivers, weight 127,000 lbs. exclusive of tender, and have 97,000 lbs. available for adhesion. They are adapted for burning anthracite fuel.

BRICK-MAKING DEVICES.—In the manufacture of brick, improved devices save one-tenth of the labor, and in the manufacturing of fire-brick 40 per cent of the manual labor is displaced. Some idea of what this means may be gained when it is shown that something like three thousand millions of brick is the annual output of the United States, employing a capital of about \$300,000,000. There is no other country in the world where brick-making is carried on so extensively, or with so much skill and profit, as in the United States.

LOCOMOTIVES FOR INDIA.—Fifty locomotives are being erected on the Clyde for the South Indian Railway Co., Limited; the whole are to be shipped within the next six months. It is further stated in regard to India railways that a proposal is under consideration, by the East Indian Council, to convert all the narrow-gauge lines of railway in India to broad-gauge lines, at a cost of about \$100,000,000.

WELDING STEEL TO BRASS.—It is said that successful experiments have been made in welding steel to brass by the electric-welding process, and in such a manner that the steel will split longitudinally without affecting the welding. The aim is to weld brass boiler-flues to steel safes, which is of much importance, as steel will stand a higher degree of heat than brass.

NEW USES FOR RAWHIDE.—The new-process rawhide, which is being introduced for gears so satisfactorily, is also being made into chisel-handles and mallets. In this shape it finds admirable adaptation, being handsome, receiving a fine polish, light, elastic, and may be turned or molded into any shape.

BLAST FURNACES.—The productive capacity of blast furnaces in the United States continues at about 175,000 tons a week, having hovered about that figure for the past 60 days. The number of rolling-mills and steel works is 445, and 11 are now in process of construction.

IRON BOLTS exposed to the action of rain-water in bridge over the Thames have in 25 years been eaten away from an original diameter of 3ths to one of 5 16ths of an inch, which is a reduction in area of cross-section of 75 per cent.

ENGLISH STOVES.—English stove manufacturers construct the bottom grates for their fires so as to be adjustable, and thus they can make a fire shallow or deep, or may spread a thin vertical fire against a front grate.

PROBABLY the first compound locomotive was built by William Baxter, in Newark, N. J. It was in practical use as long ago as 1870.

SCIENTIFIC PROGRESS.

Steady Exhaustion of the Earth's Mineral Supplies.

The enormous demands of modern industry are making most rapid inroads into almost all the various minerals of the earth—demands far greater than have been made in any past century. The *Journal of Man*, in alluding to this matter, says:

It is not merely that the absolute quantity of the earth's mineral wealth used up yearly by civilized races is large, but that the proportion of this annual consumption to the entire store is extravagant, in view of the length of time over which the store ought to last, unless the future of our race is to be much briefer than we have any reason to expect. Let us take man's use of the earth's buried stores of coal and oil as illustrations of the processes of exhaustion. It has been estimated that beneath the earth's crust there lie about 8,000,000,000 cubic yards of coal at depths rendering them available for the use of man; in round numbers this would be a little over 7,000,000,000,000 tons of coal. Of this store Great Britain has available for use about a fifth part, or, more exactly, according to the best estimates, 145,000,000,000 tons. This is an exceptionally large supply for an area so small. Yet Great Britain, which has not yet reached either the fulness of its growth or the full development of its civilization, consumes already each year more than 150,000,000 tons of coal, a rate of consumption which would fully exhaust her supply in a little over 900 years—a mere moiety of time compared with the duration of man on the earth in the past.

Thus a people who may be regarded as typical of modern civilization, supplied by nature with a hundred times more wealth in coal than the area of their country would entitle them to expect, are spending their share of this form of hurled wealth (really buried life) at such a rate that the exhaustion of the region they occupy will be completed in less than a thousandth part of even that period (a million years) which science regards as the time unit by which the earth's future is to be measured. It is not likely any other region of the earth will remain much longer stored with coal than Great Britain. Elsewhere there are immense supplies, and as yet, where these large supplies exist, the human race is not so closely crowded as it is in Great Britain; but wherever the earth is thus well stored, the population is growing in density, and at rates showing that in less than two centuries the population per square mile will be greater than in England.

So far as coal is concerned, the outlook is that the earth's buried stores will be entirely exhausted in less than 2000 years. If we remember that the consumption of coal is an index of the rate at which the other mineral stores are being exhausted, that coal is not merely being used in the direct work of civilization, but in procuring the materials by which that work is continued, we cannot fail to see that other portions of the earth's stored wealth must also be undergoing a similar process of rapid exhaustion. As a matter of fact, all other forms of stored wealth are also being exhausted at speedier rates; many are being exhausted far more rapidly even than coal, and some are being exhausted so rapidly that their future duration may be counted by years rather than by centuries.

THE HEIGHT OF SEA WAVES.—The theory of the late Capt. Scoresby as to the height of sea waves appears to be untenable, judging by the reports of the fearful weather which has recently prevailed on the Atlantic. We now know, says *Iron*, London, that powerful passenger steamers have had their hulls shattered, their deck ladders torn away, their hosts wrenched from their davits and the iron davits themselves twisted like pin wire. Now, the boats of such vessels are swung high aloft above the deck. Therefore the seas, which smashed them into match-wood and twisted the davits from which they were torn, must have been of greater elevation than 26 feet (the maximum height according to Scoresby). Not very long ago the *Servia* was the largest and most powerful passenger steamer afloat. Seen on smooth water in her ordinary trim, her towering height appears to render her secure against being hoarded by any wave, yet on one occasion a leaping sea struck her with such violence that it flattened one of her huge funnels. The height of the wave must have been nearer 50 than 26 feet. The other week the Dundee screw-liner *Croma* arrived at New York in a sea-battered condition, and reported fearful weather. She had actually shipped a sea down her funnel—an elevation of 56 feet above the ordinary water level. If steamers having a fair degree of buoyancy meet with such experience, what wonder is it that heavy cargo steamers like the National line steamer *Erin*, their decks loaded with cattle, occasionally go to the bottom?

TRAINED SENSITIVENESS.—It is very remarkable to observe the keenness to which the various senses can be educated. Some blind persons can by the sense of touch to their tongue guide a thread into the eye of a needle. Some watch-makers can ascertain if a watch is running accurately within reasonable limit by holding the watch to their ear and at the same time watching the vibration of the pendulum of a standard

clock. The carefully-trained pilot in a fog or dark night will depend upon his hearing to tell him when he is approaching an invisible object of any considerable size which projects above the water, as he will instantly notice a change of echo of the noise made by his vessel. Some engineers, trained to the sound of their engine, will notice a very slight difference in the working of any part by the change of sound, even when they are engaged in other work and apparently not listening to any noise.

A PROBLEM IN ASTRONOMY POSSIBLY SOLVED. The curious suggestion made by S. E. Peal of Assam, India, in demonstrating that Greenland is covered by a huge ice cap, may have unconsciously solved an interesting problem in astronomy. It has long been noticed that the polar caps of Mars are not diametrically opposite, the southern one not being centrally placed over the axis of rotation, and it now appears that a like anomaly may exist on the earth. In Antarctic waters are seen immense flat-topped bergs of ice 2000 feet high and several miles long, which are evidently fragments broken from a permanent cap directly over the south pole; while in the Arctic regions thin field ice preponderates and hears out the assertion that the north pole is covered by a deep sea, quite free from islands, in which the ice finds no anchorage, and is floating and temporary. Nansen's recent expedition, therefore, may result in proving that the Greenland continent underlies one of the two polar ice caps of the earth, and is giving a clew to the condition of Mars by showing a closer resemblance to our planet than had been before observed.

COMPRESSIBILITY OF WATER.—The latest volume of the reports of the Challenger expedition contains a determination, by Prof. Tait, of the compressibility of fresh and salt water at different temperatures and pressures. It is shown that the depth of a sea about six miles deep is reduced 620 feet by compression. If the ocean were incompressible, the level of the surface would be 116 feet higher than it is at present, and about 2,000,000 square miles of land would be submerged. The average compressibility of salt water is about 0.92 of that of fresh water. At atmospheric pressure, the temperature of minimum compressibility of fresh water is 140 degrees F., and of salt water 133 degrees. The temperature of the greatest density of water is reduced to freezing point under a pressure of 2 1/4 tons per square inch, the freezing point then being 27.78 degrees.

ICE AS A CONDUCTOR OF HEAT.—That ice is a conductor of heat is proved by the fact that if a mass of transparent ice be fashioned in the shape of a lens, it will act just as a burning-glass; and with such a lens, combustible substances like cotton, gunpowder, etc., may readily be set on fire if they are held at the focus of the ice lens and the solar rays are directed upon them by properly holding the lens to receive and transmit them. Of course ice, in its normal condition, is a very poor conductor. But there is no substance that can be said to be absolutely a non-conductor. They all conduct more or less of it, differing only in the degree of conductivity. Ice, however, will transmit heat quite freely.

ANOTHER SACCHARINE SUGAR FROM COTTON-SEED MEAL.—The latest reported discovery in connection with the cotton-seed comes from Germany, where it is said a process has been discovered for extracting sugar from cotton-seed meal. The sugar is of a very superior grade, but cannot be sold in competition with the ordinary article. It is said to be inclined to ferment or sour, and hence better for use in preserving fruits. It is said to be 15 times sweeter than cane sugar.

THE ELEMENTS.—There appears to be a growing tendency among chemists to regard the different "elements" as simply varying arrangements of one original atom, produced at successive stages and under different conditions in the process of cooling. Evidence in favor of the hypothesis is claimed by the fact that some earth elements seem not to have yet been formed in the sun, while others are absent from still hotter stars.

ARTIFICIAL MALACHITE.—Some beautiful specimens of artificial malachite were recently presented to the French Académie des Sciences. They are apparently well adapted for ornamental work, and have been produced by a process discovered by Prof. de Sohulten of the University of Helsingfors. It consists in evaporating a solution of carbonate of copper in carbonate of ammonia.

THE DOG.—At a late meeting of the London Zoological Society, Mr. A. D. Bartlett read a paper going to show that the varieties of the domestic dog owe their origin to wolves and jackals, the habit of barking having been acquired under the influence of domestication.

SACCHARINE DETRIMENTAL TO HEALTH.—The use of saccharine in France has been restricted, as its antiseptic nature, when used in large quantities, retards digestion, neutralizing the gastric juice.

THE REINDEER.—Recent efforts have lately been made to acclimatize the reindeer to Germany for various purposes; but the heat of the summer was too great for the animals.

A "BLOOD" ROSE.—It is said that a new rose has been produced in soil made from blood.

GOOD HEALTH.

Danger in Dust.

MESSRS. EDITORS:—As there are a great many people who do not believe in the existence of germs in the air, I will give you an instance that came under my observation which ought to convince the most skeptical.

My brother-in-law, a carpenter, took a contract to pull down and rebuild the old Arcade building situated on Second and J streets, Sacramento. In doing this work he inhaled a great deal of dust, and very soon afterward began to complain of shortness of breath, then smothering spells, in which he was unable to breathe unless he was fanned constantly and the windows kept open.

The doctors pronounced it "heart disease" and advised his family not to leave him alone, as he was liable to die at any time.

He lingered along for two years, and about a month before he died, began to cough up blood and mucus. His left lung was very sore and painful; his physicians said he had taken cold and had pneumonia. After pointing his lungs three days, in a violent fit of coughing he ejected a white insect an inch long; it had four legs, a prothorax, and eyes that resembled two tiny black heads.

The medical fraternity gave it as their opinion that he inhaled the germ or egg in the dust of that building.

READER.

Secret of the Skin.

Did it ever occur to you, says a contemporary, that the skin wants exercise and gets very little? Nothing is a better tonic for the complexion than a brisk cold sponge bath on rising, followed by vigorous rubbing with a dry towel, not too coarse—the face and neck receiving their full share of the friction unless the skin is very sensitive, in which case the bare hands may be the instrument instead of the linen. This sets the blood to moving briskly and electrifies the system. At bedtime a warm bath may be taken, and the face should be washed slowly, carefully and thoroughly with warm water and castile soap. The oily matter exuding from the skin catches minute particles of dust which cannot be removed in any other way, and many eruptions on the face are caused by nothing else than neglect of this simple precaution. After this wholesome cleansing, dip the face into a basin of clear, cold water, opening and shutting the eyes under the surface, and the flesh will be left firm and healthy. The entire process will take barely ten minutes in the morning and twenty at night, and can, if needful, be taken from the regular sleep, the bath being quite as restful and refreshing.

Friction of the Skin.

As of further value for friction of the skin, Dr. A. Penykoff of Berlin, through a medical journal, advises treating intermittent fever with friction along the spine. Many years ago so many cases of intermittent fever occurred in his regiment, stationed in Serbia, that the quinine supply was failing, when rubbing the back twice daily with ample ointment was ordered for certain patients. The day after, the usual attack did not appear. The treatment has been frequently employed since, and three-fourths of this physician's cases have done very well without any quinine at all.

MILK FROM A DISEASED COW.—The Fresno Republican recently gave a brief report of a case in that neighborhood where a child was taken seriously ill. The physician whom the mother called in decided that the illness had been caused by drinking the milk of a diseased cow, and a ringworm on her arm was ascribed to the same source. The family had been using milk from a neighbor's cow which was afflicted with an ulcer in her hind quarter, and it is believed that the poisonous matter in her blood had tainted her milk. A complaint was made to the City Board of Health, but inasmuch as the cow and the owner lived outside the city limits, the board had no jurisdiction. The man had stated to several people that his income from the milk of the diseased animal was \$15 a month. Section 383 of the Penal Code of California reads as follows: "Every person who knowingly sells or keeps or offers for sale, or otherwise disposes of, any article of food, drink, drug or medicine, knowing that the same has become tainted, decayed, spoiled or otherwise unwholesome or unfit to be eaten or drunk, with intent to permit the same to be eaten or drunk, is guilty of a misdemeanor."

DEATHS FROM LIGHTNING.—The majority of the deaths from lightning occur in the level, open country. Trees, villages and thickly built-up towns and cities, by their projections into the air, which serve as conductors, protect the inhabitants from direct strokes. The loss of life annually by the lightning stroke throughout the world is great. In European Russia, in the seven years between 1870 and 1877, 2270 persons were killed. In Austria, 1700 persons were killed during the same period. Prussia averages 70 persons annually. In France, 10,000 persons were struck in 29 years, with 2252 deaths. In 1870, there were recorded in the United States 202 deaths from lightning.

THE DEADLY COLD BED.—If trustworthy statistics could be had of the number of per-

sons who die every year or become permanently diseased from sleeping in damp or cold beds, they would probably be astonishing and appalling. It is a peril that constantly besets traveling men, and if they are wise they will invariably insist on having their beds aired and dried, even at the risk of causing much trouble to their landlords. But the peril resides in the house, and the cold "spare room" has slain its thousands of hapless guests, and will go on with its slaughter till people learn wisdom. Not only the guest but the family often suffer the penalty of sleeping in cold rooms and chilling their bodies at a time when they need all of their bodily heat by getting between cold sheets. Even in warm summer weather a cold, damp bed will get in its deadly work. It is a needless peril, and the neglect to provide dry rooms and beds has in it the elements of murder and suicide.—*Ex.*

HYPNOTISM.—A number of London medical men have united to form a hypnotic society, the purpose of which will be to prevent by law public exhibition of mesmerism and hypnotism. Another object will be to study privately and in a scientific manner the phenomena of those morbid states.

USEFUL INFORMATION.

THE VALUE OF EARTH-WORMS.—Darwin estimated that worms, by swallowing earth for the sake of the vegetable matter it contains and forming castings, bring to the surface as much as ten tons of earth per annum on an acre. Worms are great promoters of vegetation by boring, perforating, and loosening the soil, and rendering it pervious to rains and the fibers of plants by drawing straws and stalks of leaves and twigs into it, and most of all, by throwing up such infinite numbers of lumps of earth called worm casts, which form a fine manure for grain and grass. The earth without worms would soon become cold, hardbound, void of fermentation, and consequently sterile; this has occurred in many cases where the worms have been either accidentally or intentionally destroyed, and the fertility of the soil thus lost has only been restored when the worms had again collected and resumed their fertilizing work.

A ROPE THAT WILL FLOAT.—A cork core floating rope has been invented. The inventor claims that his floating rope of one-inch thickness will stand a strain of more than 1000 pounds. The rope consists of a core of small round corks, about three quarters of an inch long, placed end to end, around which is braided a network of cotton twine. This is surrounded by another layer of strong cotton twine, braided in heavy strands, which is about a quarter of an inch thick. The rope is very soft and pliable, and even after being tied into a small knot will return to its original shape. It can be used in life lines on life rafts, and as a heaving line to tie heavy hawsers to. At a life-saving station such a rope would be very valuable.

ANOTHER cheap and simple fuel discovery is announced in Germany, which possesses advantages that will tend to bring it into universal use. The process, which has been patented at Munich, Bavaria, converts turf into a firm and highly valuable combustible material resembling anthracite coal and burning without smoke or odor. Through a successful combination of several oft-tried processes, the cost of production has been brought down to a point that will admit of a patent tariff entering into competition with coal.

WRITING INK.—C. H. Vieldt of Brunswick, Eng., who has written very exhaustively on all kinds of ink, divides the black writing ink into three varieties, viz., "galls ink," ditto with logwood, and ditto with indigo. The best quality of these is, chemically, a ferrous-ferri gallate, or tanno gallate of iron. It is made by mixing, according to one maker, for 12 gallons of ink: 12 pounds of bruised blue Aleppo galls; 5 pounds of alaphate of iron (green copperas); 5 pounds of gum senegal, dissolved in 12 gallons of water.

A NEW PATENT UMBRELLA will soon be on the market. Its distinctive feature will be a stick grooved to form a bed for each one of the frame ribs. The result of this structural arrangement is said to be a clear gain in point of weight and bulk upon the regulation article. Supporters of this new patent claim that an umbrella so made is, when tightly rolled, as light, as firm, and as trim as a medium-sized walking-stick, while it loses nothing in point of strength and durability.

THE LATEST NICKEL IN THE SLOT has wonderful possibilities. It is connected with the telephone, and by dropping the required coin in the toll-box attached to the phone, the connection is made with central without the prolonged ringing that usually precedes a conversation with that dignitary. At least, such miraculous powers are claimed for this new invention.

TO SOFTEN IVORY.—Dr. Lankester recommends phosphoric acid, of the usual specific gravity, which renders ivory soft and nearly plastic. When washed with water, pressed, and dried, the ivory regains its former consistency, and even its microscopic structure is not affected by the process.

ENGINEERING NOTES.

The Cantilever Principle.

The cantilever principle in bridge-building, which is now so universally employed in such structures, is not as new as many suppose. A New Yorker named Thomas Pope, as early as 1811, published a short treatise on bridge-building which was primarily designed to set forth the advantages of a "Flying Pendant Lever Bridge" which he had designed for a connection between Brooklyn and New York. This book is only found in a few private libraries of to-day, and has recently been fished out of the dust of 80 years by our contemporary of the *Manufacturer and Builder*, from which journal we collate these facts. The bridge was to consist of a single span 1800 feet long, the center of which would be 233 feet above high water. The span of the Brooklyn bridge is only 1500 feet. The plan described is identical in principle with what is now designated as the "cantilever"—an expression equivalent to "pendant lever," as employed by Mr. Pope.

This fact is all the more interesting at this time, since this particular type of bridge structure is generally believed to be of comparatively recent origin and to have originated with the American bridge-builders of the present day. Notable examples of this form of bridge structure exist in various parts of the world, notably among which are the recently constructed steel railway bridge at Niagara Falls and the great steel bridge just opened for traffic over the Frith of Forth in Scotland.

To illustrate the practicability of his ideas, Mr. Pope constructed a model of half the proposed bridge, which was nearly 50 feet in length, on a scale of three eighths of an inch to a foot. The weight borne at one time by the unsupported arm of this diminutive model was ten tons, which astonished the mind of every beholder. The model was afterward completed by adding the other arm, making the model 100 feet in length. From this work the reader will be able to appreciate the completeness with which this engineer had grasped the fundamental principles of the cantilever system in bridge-building.

Mr. Pope's plan consisted of a bridge in which the superstructure consisted of projecting beams or levers fixed at one end to the abutments or piers and free at the other end. The best that can be said in behalf of builders of the present generation is that they have revived an old idea and that the revival is to be credited principally to American engineers, who have been the first to appreciate the merits and adopt the system so perfectly set forth by their countryman of 1811, who lived at a time when his genius was not properly appreciated.

A very good idea of the sustaining power of bridges built on the cantilever system may be formed from the apparently authorized statement that each cantilever of the Forth bridge will sustain six of the largest iron-clads in our navy.

A RAILWAY TUNNEL is now proposed for connecting Brooklyn with New York City. It is proposed to construct it under East river, between South Sixth street, Brooklyn, and Broome street, New York. The work is already taking definite form, the contract for building it having, it is stated, been awarded to the American Tunnel Construction Company. The total length of the tunnel is to be 2890 feet, and it is promised that it will be completed within two years after securing the consent of the authorities of the two cities, which condition, however, gives an element of indefiniteness to the enterprise.

LARGE DAM IN INDIA.—The Tanea reservoir, situated about seven miles from the Atgann station, will consist of one great dam spanning the beds of two rivers with a length of nearly two miles. It is composed entirely of rubble masonry; the height of the center will be about 65 feet. The work is progressing with considerable rapidity, and the huge wall, at last accounts, required only to be raised from 15 to 20 feet to be finished. The progress of the work is so far satisfactory that, if the duct works are ready by March 1, 1891, the reservoir will be ready to give the water.

IMMENSE BRIDGE SPANS.—The span of the Brooklyn bridge is 1500 feet. The two spans of the Frith of Forth bridge are 1710 feet each. M. Stoffel, the well-known French engineer, proposes a bridge of remarkable construction for the mouth of the Tagus, at Lisbon, Portugal. It would be nearly twice the length of the Brooklyn bridge, while its spans would be to those across the East river as nine to five, or almost twice as great.

A NEW STYLE OF ELEVATED ROAD for rapid transit has recently been proposed to a party of Chicago capitalists by a gentleman named Goudie. His invention, he claims, will greatly improve the speed and decrease the cost of transportation. Runners much like those of sleighs are to be used in place of wheels, the latter being part of the track, and their revolution, aided by oil from the moving train, is one of the leading aids in increasing the velocity.

THE NICARAQUA CANAL.—The work upon this enterprise, notwithstanding reports to the contrary, is being pushed in a most active manner. A very large contract has just been let

to C. P. Treat & Co. of this city. This contract calls for the building of ten miles of railroad from the mouth of the San Juan to the canal locks of the Atlantic divide. The work will cost from \$150,000 to \$200,000, and will be completed about four months. This road is merely a temporary work for use in constructing the canal. When the railroad is completed there will be transported over it the machinery to be used in excavating the great ship-locks and in cutting through the Atlantic divide.

ELECTRICITY.

A NOVEL and simple form of electric battery has recently been invented in Italy. As described in the *Revisita Technica Science* it consists of conical vessels of cast iron and porous earthenware, with nitric and sulphuric acid. An iron cone is placed point downward in a stand, and is partly filled with strong nitric acid. Into this there is placed a cone of porous earthenware containing dilute sulphuric acid. Then follows an iron cone surmounted by an earthenware one, and so on in a series, each vessel containing its respective acid. It follows that the inner surface of each iron vessel is bathed in nitric acid, and becomes passive, acting the part of the platinum or carbon in an ordinary cell. The outer surface is attacked by the dilute sulphuric acid, and takes the place of the zinc. There are no connections to make, the simple building of the pile putting all the parts into union. The earthenware cones are 8 inches in diameter and 4 inches in height, and contain 550 cubic centimeters of 10 per cent sulphuric acid solution. The iron vessel contains 110 cubic centimeters of nitric and sulphuric acids, the latter being three times the volume of the former. Sixty elements arranged in two piles have a resistance of 104 ohms, an electro-motive force on open circuit of 81 volts, and on closed circuit of 45 volts, with a current of 4.410 amperes. After five hours the difference of potential falls to 28 volts and the current to 2.7-10 amperes.

ELECTRICITY AS A MOTIVE POWER FOR STREET CARS.—It was stated in a recent address at the Jefferson Physical Laboratory at Cambridge, Mass., that "as a motor-power for street cars, electricity has many advantages. Electric cars can be run at any speed up to 18 miles an hour or even higher. Cars running at high rates of speed are less dangerous than those running at low rates. People are more cautious. If all the cars of the West End Company had been run by electricity during the past year, there would have been a saving of over \$1,000,000 in money and 100 years of time to the persons using them. The adoption of electricity means cleaner streets and consequently a lower death rate. The system in this city and Boston is not perfect as yet. One improvement soon to be introduced is to divide the overhead wire into sections insulated from each other. In case of an accident to one section, travel will not be delayed on the others. In 1888 there were ten electric roads in this country in operation. To-day 30 per cent of the street-car roads use electricity or are preparing to do so. Among the proposed improvements by the West End Company are larger cars. Some 50 cars are now building, some on the Robinson radial system, others with a swivel truck at each end. The final means of propulsion in all street cars will be electric motors, and these motors will probably be run by storage batteries."

ANOTHER ELECTRIC SAFETY DEVICE.—Mr. A. P. Hafner of New York has invented a very simple little contrivance called a protector, which is made of German silver or fuelie wire, and the coil of an electric magnet. By this device the danger of fire or electrical shocks in telephones or messenger calls is said to be entirely removed. Whenever an abnormal current is introduced into the building by reason of telegraph, telephone or other wires coming in contact with electric-light lines, the coil of the magnet becomes magnetized, attracting the armature, the instrument protected are out from the circuit, and the abnormal current is carried direct to the ground. It is concentrated in the German silver wire, which causes it to fuse if the current is dangerous, and completely opens the line.

DEATHS FROM ELECTRICITY.—Capt. Eugene Giffia, manager of the Thomson-Houston Co., in a recent lecture before the Jefferson Physical Laboratory of Cambridge, in speaking of the dangers attending the use of electricity, cited statistics to show that in New England there have been only five deaths by electricity in ten years, and of these five, four were employees. In the same time there have been 5241 deaths from railroad, and of these, 2902 were not employees. Why not tear up the railroad as well as pull down the telegraph wires?

IMPROVEMENT IN INCANDESCENT LIGHTS.—A new improvement in incandescent lights, it is stated, is being introduced by the New Bedford Gas-Light Company, whereby the burners can be turned down without putting them out entirely. They are on exhibition in the company's office with a meter attached in a glass case, and it is seen that the meter revolves more slowly when the lights are dimmed. Customers therefore pay for the amount of light they use.

TABLE OF CONTENTS.

EDITORIALS.—Mechanical Feed for Boiler Furnaces, 263. Passing Events; The Silver Question; Work for the Engineers; A 40-Inch Telescope; Grand Canyon of the Colorado, No. 3; Point in Favor of Mining Shareholders, 270. The Bear Valley Arch Dam; An Improved Lamp-Burner; An Electric Rotary Pump, 271.

ILLUSTRATIONS.—The Temples and Towers of the Virgin, Grand Canyon of the Colorado; Setting a 150-Horse Power Heine Boiler with Mechanical Stoker, 263. Glacial Bank at Blue Tent Mine, Nevada Co., Cal.; Stratified Glacial Deposit near Hamilton, Ohio; Zander's Improved Lamp Burner, 271.

CORRESPONDENCE.—The Deep Gold Places of California, 264.

MISCELLANEOUS.—How to Tell the Age of Trees; The Late Dr. Parry; The Blind Seldom Smoke; The Coming Census-Taking; An Eiffel Tower of Ice, 265.

MECHANICAL PROGRESS.—The Future of Nickel Steel; Amount of Friction Between Different Bodies; Brozing Iron or Steel; A New Kind of Water Pipe; Steam Trains on City Streets; Ten-Wheeled Locomotives; Brick-Making Devices; Locomotives for India; Welding Steel to Brass; New Uses for Rawhide; Blast Furnaces; English Stoves, 268.

SCIENTIFIC PROGRESS.—Steady Exhaustion of the Earth's Mineral Supplies; The Height of Sea Waves; Trained Sensitiveness; A Problem in Astronomy Possibly Solved; Compressibility of Water; Ice as a Conductor for Heat; Another Saccharine Sugar from Cottonseed Meal; The Elements of Artificial Malachite; The Dye; Saccharine Detrimental to Health; The Reindeer; A "Blood Rose," 268.

GOOD HEALTH.—Danger in Dust; Secret of the Skin; Milk from a Diseased Cow; Deaths from Lightning; The Deadly Cold Bet; Hypnotism, 269.

USEFUL INFORMATION.—The Value of Earth-Worms; A Rope that Will Float; Writing Ink; To Soften Ivory, 269.

ENGINEERING NOTES.—The Cantilever Principle; Large Dam in India; Immense Bridge Spans; The Nicaragua Canal, 269.

ELECTRICITY.—Electricity as a Motive Power for Street Cars; Another Electric Safety Device; Deaths from Electricity; Improvement in Incandescent Lights, 269.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 266-267.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 274.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, 274.

Passing Events.

With the cessation of rains, active work has been resumed in the various mining camps of the State, where little else than pumping has been done for months. In the mountains there is still considerable snow and a great deal of water in the ground. Still money is becoming more plentiful and business begins to show the effect of it.

The molders' strike in our local foundries still continues, though the men seem now willing to arbitrate on certain points, notably the limitation of work and the apprentices question. However, there is as yet no special change in the situation.

There are rumors of the finding of placer gold and quartz discoveries in the Grand canyon of the Colorado. Coarse gold is reported on the bars. Men are going down from Denver, but it will be found a pretty hard region to prospect and mine in, although there is plenty of water.

The arrival at the Clark of the casting of the glass for the 40-inch crown glass of the proposed telescope for Southern California shows that the work is going on in the preparation of the greatest of lenses, although at one time it was supposed the project had been abandoned.

The Silver Question.

The mining industry of the United States, and also the farming industry, which is largely dependent upon the market value of silver, are to be congratulated upon the advance in the price of the metal. In our long statistical review of the silver problem, we gave interesting data showing that the world's silver requirements were in excess of the output, and that with proper legislation the price of silver could be readily advanced to par. The present advance in the market is confirmatory of our then expressed views, and if the present Congress should pass an Act based upon Senator Jones' bill, it is only a question of a short time when the metal will be remonetized, not only in this country but by the European Governments, and particularly so now that that great opponent, Bismarck, has been retired in Germany. There does not appear to be the least doubt expressed but what a silver bill will be passed by Congress. At this writing, it is said that the Senate and House committees arbitrating on the respective bills have agreed on the Senate bill to purchase \$4,500,000 worth of silver monthly, looking to free coinage in the future. The only difference between the committees is how the certificates to be issued in payment for the bullion are to be redeemed. The Senate committee wants them redeemed in lawful money of the United States, while the House committee stands out for their redemption in silver bullion. If the former course is pursued, then the metal is at once raised as a currency medium on a par with gold; but if the certificates are redeemed in bullion, then it and the certificates become a speculative gamble with fluctuating value. With uncased bullion piled up in the Treasury vaults, the situation becomes a menace to European and other countries, which will put off, indefinitely, the remonetizing of silver abroad.

At this time, with an international bimetallic conference growing in favor abroad, it behooves bimetallicists in this country not to accept any proposition that is likely to throw discredit on the present movement looking to the remonetizing of silver. That there is abroad a strong growing feeling in favor of bimetallicism cannot be doubted, for our leading exchanges reflect this change of heart. Even Samuel Smith is reported by cable to favor an international monetary conference looking to bimetallicism. But probably the strongest move in this direction is that of the English mill hands, who have signed by thousands and forwarded to the House of Commons the following petition:

That the well-being of the industry in which we are engaged depends largely upon trade between Great Britain and silver-using countries; that the loss and disturbance to the free flow of trade resulting from there being no fixed connection between our money and the silver moneys of our customers in India, China, Japan and elsewhere, operate injuriously upon the cotton trade; that it is most important there should be no hindrance to the profitable development of the great industry with which we are connected, so that full and regular employment may be provided for our constantly increasing population. Your petitioners therefore pray that your honorable House may be pleased to approve of a conference of the chief commercial nations of the world being called to consider whether a bimetallic system can be re-established by international agreement.

A 40-inch Telescope.

The casting for the object-glass of the proposed 40-inch telescope for the University of Southern California has been completed by Mantois of Paris, and has arrived at the establishment of the Clark Bros., Cambridge, where it will be ground during the next two years. This crown glass is 40 inches in diameter, the largest ever made, exceeding the glass of the Lick telescope by four inches. The maximum thickness when completed will be about two inches. Since the completion of the Lick telescope, it has been found possible to cast larger glasses at less cost. The flint glass for the proposed telescope has not yet been made, but that is comparatively easy to do. It is the intention of the University of Southern California to place this telescope, when completed, on the summit of Wilson's Peak, back of the Sierra Madre villa, Los Angeles county. This peak is nearly 6000 feet high.

When Mr. Alvan G. Clark was here last year, he visited the peak with a good telescope and looked at many test objects, and it was his

opinion that the selection of the site was very promising. He said also, by the way, that if he ground and finished the big lens he should do it in California. The University of Southern California is a Methodist institution, which already has a good deal of money. Mr. Spence, a wealthy resident of Los Angeles, is credited with being the man who will furnish most of the money for the proposed observatory.

Point in Favor of Mining Shareholders.

The case of Fox vs. Levy is an action brought to compel the directors of the Savage Mining Company to conform to that section of the Act passed by the Legislature in 1880, which reads as follows: "It shall also be the duty of the superintendent to file with the secretary a weekly statement, under oath, showing the number of men employed under him and for what purpose, and the rate of wages paid to each one. He shall attach to such account a full and complete report, under oath, of the work done in said mine, the amount of ore extracted, from what part of the mine taken, the amount sent to mill for reduction, its assay value, etc." While the superintendent complied in part with the above section of the law, he neglected to give the value of ores at the mine, that is, the assay value of the ore when first discovered in the drift, and next the assay value of samples taken from the car when sent to the mill. Levy entered a demurrer to the complaint, which was sustained by Judge Shafter, before whom the case was brought; but in the second action brought by the plaintiff Fox to enforce the law, Judge Shafter overruled the demurrer of the defendant, and now the case will go before him on its merits. In the second presentation of the case the facts were brought out more fully, and to the judge's credit, he said, he overruled his former decision. There can be no doubt that with a decision in favor of the plaintiff, mining on the Comstock will have to be carried on more openly, which will disarm criticism and create with the public greater confidence in the shares of the mines.

Work for the Engineers.

California will get this year in the river and harbor appropriations about \$650,000, a larger sum than ever before allowed the State. For Oakland harbor not less than \$250,000 has been allowed. Napa creek gets \$110,000; Redwood creek, \$3000; Humboldt bay, \$80,000; Wilmington harbor, \$40,000; the San Joaquin river, \$75,000. The sum of \$50,000 has been set aside to make surveys for a breakwater at Santa Cruz and at Redondo beach. For surveys of Suisun bay and the mouth of the Sacramento, \$14,000 has been allowed.

As far as the improvement of the Sacramento and Feather rivers is concerned, it is found to be impossible to make an appropriation until the engineers make examinations, surveys, maps and estimates, and submit them to Congress. This has been ordered done, and the money for the work will be taken from the contingent fund. Most of the money for the San Joaquin river will be expended in the repair of the Paradise cut-off and Laird's slough. The State ranks third as far as securing appropriations are concerned. For Oregon, for improving the Columbia, about \$1,000,000 has been appropriated. This amount includes the sum of \$500,000, allowed for the continuance of the jetty work at the mouth of the river. For Coos bay, it is understood that \$120,000 has been allowed, which is to include the continuance of the work on the jetties. A survey looking to the removal of shoals in the upper harbor is also authorized.

Yaquina bay gets \$120,000, and \$500,000 is allowed to commence work on the jetty at Sinslaw bay. For continuing work at the mouth of the Coquille river, \$30,000 is allowed, and \$10,000 to commence work on the jetty at the mouth of Nehalem bay. To improve the Upper Willamette above Portland, \$12,000 is appropriated. Ten thousand dollars is allowed for dredging at Tillamook bay.

The men in a Seattle foundry are out on a strike, and the foundry's products have been boycotted because the proprietors were learning the trade, and constituted more than the number of apprentices allowed by Union rules.

Grand Canyon of the Colorado.

NUMBER III.

In continuing the description of the Grand Canyon of the Colorado an engraving is given this week of "The Temples and Towers of the Virgin." In the center of the picture is the Western temple; to the right of it is the Mukuntuweap Fork or Little Zion Valley, and across it is the eastern temple. On the extreme right is the opening of the Parunuweap. In the middle distance is the inner canyon of the Virgin. In Dutton's United States Geological Survey Monograph he says, in speaking of the temples and towers of the Virgin: At our feet the surface drops down by cliff and talus 1200 feet upon a broad and rugged plain, cut by narrow canyons. The slopes, winding ledges and scanty soil display colors which are truly amazing. From right to left across the further foreground stretches the inner canyon of the Virgin, about 700 feet deep and here of considerable width. Across the canyon, a mile and a half beyond, stands the central and commanding object of the picture, the Western temple, rising 4000 feet above the river. Yet it is only the central object of a mighty throng of structures, wrought up in the same exalted style and filling up the entire panorama.

The Parunuweap is seen emerging on the extreme right through a stupendous gateway and chasm on the terrace nearly 3000 feet in depth.

Directly in front of us is a complex group of white towers, which, springing from a central pile, mounts upward to the clouds. Out of their midst and high over all rises a dome-like mass which dominates the entire landscape. The towers which surround it are of inferior mass, but each is a study of fine form and architectural effect.

Nothing can excuse the beauty of the Little Zion valley, which separates the two temples and their respective groups of towers. Nor are these the only anblime structures which look down into its depths, for similar ones are seen on either hand until a turn in its course carries the valley out of sight.

THE STRIKE.—There is no special change in the situation in the matter of the molders' strike in this city. The Foundrymen's Association continues to bring in more men to take the places of the strikers, notwithstanding the patrols intended to prevent this. A number went into one of the foundries this week dressed in tourist's costume, passing by the patrol of strikers without being recognized as molders. It is stated that the men who are out are now willing to arbitrate on some of the points involved, but insist on the former rate of wages. As the strike continues, there is great loss on both sides, considerable work going elsewhere to be done.

The purchasers of the Lucky Dog mine near Unionville, Nev., are erecting works to reduce the ore. The works will be erected in the north fork of Cottonwood canyon, known to old-timers in Unionville as Anderson Creek, just below the mine.

THE MECHANICS' INSTITUTE FAIR will be postponed so that the Native Sons of the Golden West and the California Pioneers can use the Pavilion on the 8th, 9th and 10th of September, in celebrating Admission Day.

The building erected in East Oakland by F. M. Smith for a borax refinery will not be used for that purpose, inasmuch as Mr. Smith has bought the Alameda borax refinery, formerly owned by W. T. Coleman.

THE CALAVERAS Chronicle says three of the dead miners in the Utica mine can be seen, but it will take a good deal of work before their bodies can be recovered. There are still 13 bodies in the mine.

THE balance-sheet of the South Yuba Water & Mining Company of Nevada county for 36 years shows total receipts of \$3,853,481.87, and dividends paid of \$1,239,358.79.

FIFTY TONS of rail of the Burgion patent have been rolled and shipped to A. D. Wilder, who will lay a mile of experimental track on the Oakland mole.

WORK is progressing on the construction of the Oakland electric street railroad. The trackways are being built on Thirteenth street, west of Franklin.

The Bear Valley Arch Dam.

The American Society of Civil Engineers has taken an interest in this remarkable structure in the San Bernardino mountains, and recently asked the company to have experiments made upon it to determine the elasticity of such works. This proposition arose from the fact that a larger dam is to be constructed below the present one, and it was believed that such an occasion should be utilized to make the unique experiments for which there has never been a similar opportunity. Circular letters were sent to all the members of the society, to technical and engineering societies, and to distinguished scientific engineers. In reply to this circular letter, Mr. John G. North, the general manager of the Bear Valley Land and Water Co., has written to Secretary John Bogart that "the company fully appreciates the value to engineering science of the observations and measurements suggested, and will see that they are made. Prof. George Davidson, who has recently acted as consulting engineer for the company, will undoubtedly consent to make the observations with the chief engineer of the company, Mr. Frank E. Brown, who designed and built the present structure."

Mr. North has written to Prof. Davidson and expressed his wish that he would make the necessary observations and experiments; and the professor has agreed to do so. There can be no doubt but when the proper time comes, an exhaustive series of observations will be made. Prof. Davidson says that Mr. Brown's conception of the present dam and his success in building it have placed him in the front rank of original engineers. There is no danger in the structure, which has stood for years, with water at times reaching crest, pressed upon by ice, and through sharp local earthquakes. The more it is studied the more satisfactory the impression it creates.

An Improved Lamp-Burner.

Lonis Zander of 1223 Twenty-first avenue, East Oakland, has just obtained through the MINING AND SCIENTIFIC PRESS Patent Agency a patent on an improved lamp-burner into which the wick is easily inserted. Fig. 1 of the engravings is a view of the burner, a portion of the side being broken away to show the wick-tube and the upper portion of the slide-plate, *b*, being broken away to show the wick. Fig. 2 is a horizontal cross-section of the wick-tube.

A is an ordinary lamp-burner composed of the usual parts, namely, the threaded shank *a*, the ratchet spindle *a'*, the chimney gallery, *a''*, the spring arm *a'''*, and the hinged cap *a''''*.

B is the wick-tube located as usual. This tube, instead of being a complete hollow casing or shell, is formed with an open side completed by a slide-plate *b*. The main portion of the tube forms one side, the two ends being bent at its edges to form said ends. The movable portion of the slide-plate, *I*, slips in between these bent edges and completes the tube.

The joint between the slide-plate and the main portion of the tube may be of any suitable

character, but the inventor here shows a practical connection consisting of grooved flanges *b'* on the side edges of the slide-plate, which fit over the bent edges of the main portion, thus forming a complete and sufficiently tight joint, which insures the stability of the slide-plate, at the same time permitting its ready removal and insertion.

C is the wick. When the wick is to be in-

Zander's Improved Lamp-Burner.

serted, the slide-plate is removed from the tube *B*, thereby exposing the open side of said tube. The wick is then inserted in the tube through its open side, the edges of the wick being readily pressed in past and under the bent edges of said tube. Then the slide-plate is put back, thus fully inclosing and confining the wick. This operation is easier than the usual process of forcing the wick through a complete tube and past its ratchet wheels.

The reduction works at Redding, Shasta county, which were about to be started up again, were destroyed by fire on Wednesday. The loss is about \$6000.

Fig. 6.—GLACIAL BANK AT BLUE TENT MINE, NEVADA COUNTY, CAL.

An Electric Rotary Pump.

Emory I. Nichols of this city has procured through the MINING AND SCIENTIFIC PRESS Patent Agency, a patent (No. 425,106) on a simple electrically driven pump, the inventor wrapping the revoluble shell of a rotary pump with wire in such a manner as to form an armature of an electric motor.

There is a fixed hollow shaft, one end of which forms the inlet port and the other the outlet. This shaft is formed with an eccentric center having an encircling port communicating with the inlet and discharge ports. Upon the shaft is mounted, and adapted to revolve, a shell, which, inclosing the eccentric center, forms at one part or line, an abutment, and at the remaining portion a water-space. Suitable packing and stuffing boxes are used between the parts.

In the shell are swinging pistons controlled by springs and operating against the circumference of the eccentric center. This forms a rotary pump, the operation of which, upon revolving the shell, is obvious. To revolve this shell, Mr. Nichols makes the pump, or a rim connected therewith, from the core of an electric motor. This is done by properly wrapping the shell with wire so as to form an electric armature. This wrapping may be done in any suitable manner, and it may be directly on the shell or upon a rim carried by the shell.

The operation of the device is as follows: The electric current, passing through the brushes and energizing the armature, the latter is revolved by the field magnets. The shell is therefore rotated, and, through its pistons, sucks in and forces out the water. An advantage of this form of armature lies in the fact that by reason of the hollow journals through which the water is passing there is no liability to the drawback of hot journals to which high-speed electric motors are subject. Mr. Nichols has assigned this patent to Irvine Stewart and Frank F. Tremper of this city.

The Deep Gold Placers of California.

(Concluded from page 264.)

lying by their sides, are concave on the inner surface, leaving the remaining portion more or less globular, as in the case of the granite boulders before mentioned. The basalt is uniform in structure, has no particular cleavage, and breaks with a tendency to form sharp angular fragments; yet the same rock, when exposed to the action of the elements for a long period, invariably weathers into rounded forms while lying on the surface of the ground, and not subjected to any special action of water above that of small winter streams and overflows. This discovery led to more careful examinations, and I am convinced that this is a general law which bears equally on all rocks, including the quartz, which, being harder, resists longer, but eventually yields to the inevitable law, and its fragments become rounded, far from rivers or rushing waters. When by accidental floods or changes in the course of streams, boulders fall into their beds, they become more rounded and smoothed. At Red Hill I actually saw quartz boulders being thus formed, which, without doubt, came from a prominent quartz vein within a few hundred feet of where they lay. Closely observing boulders of every variety of rock which lie exposed in the placer and hydraulic mines, I found them all showing evidences of this law, and I collected concave scales which have been placed in the State Museum, where they will be preserved and may be studied by those who take an interest in this most interesting subject.

I have in my collection a small howlder of diabase from near Boston, Massachusetts, which shows this weathering in a striking manner.

No soft rock can become a howlder, or if so its life as such must be very short, for if not ground to silt by the forces referred to, it would quickly disintegrate if exposed to the atmosphere and the rays of the sun. For this reason I assume that the soft bedrocks of the ariferous channels so deeply excavated were disintegrated and washed away by the glacial rivers, while the more resistant quartz and the malleable gold sank to the bedrock and have so remained.

The fact that howlders are generally elongated, lenticular and egg-shaped instead of being more perfectly spherical, has much puzzled geologists. Von Cotta ("Rock Classification and Description," English Edition, London, 1866) thus refers to this peculiarity:

"This very universal law is evidently the result of an unequal degree of resistance to waste, presented by the stone in the direction of one or more normal axes. In the case of rocks of slaty texture or the like, this phenomenon may be readily conceived; but in the case of compact and granular rocks without a trace of fissile or laminated texture, it is more remarkable, and points to some parallelism of texture or structure which has hitherto escaped observation."

My study of this subject leads me to the conclusion that this form is due to the accidental shape of the original fragments, the rounded howlder retaining in some degree its cuneiform, tabular or intermediate character.

Boulders are found in the beds of modern rivers certainly, but it does not follow for that reason that they are wholly the result of the action of water flowing in a channel, for they lie scattered over the whole country and in the glacial drift they are placed as described elsewhere. If any stream flowing in such a formation could be diverted and forced to cut a new channel, boulders would be as numerous as in the old.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery. Adapted to heads running from 20 up to 2,000 feet. From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

THOMAS PRICE & SON, BULLION ROOMS and ORE FLOORS,

Assay Office, Chemical Laboratory,

524 Sacramento Street, San Francisco, Cal.

COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.

WORKING TESTS OF ORES BY ALL PROCESSES.

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

Metallurgy and Ores.

**SELBY
SMELTING and LEAD CO.,**
416 Montgomery St., San Francisco.

**GOLD AND SILVER REFINERY
And Assay Office.**

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

ALSO MANUFACTURERS OF
**BLUESTONE,
LEAD PIPE,
SHEET LEAD,
SHOT, Etc., Etc.**

ALSO MANUFACTURERS OF
Standard Shot-Gun Cartridges,
Under Chamberlin Patent.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

**ASSAYERS' MATERIALS, MINE
AND MILL SUPPLIES,**

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.

63 & 65 First St., cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Sootifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Agents for the Morgan Crucible Co., Battersea, England. Also for E. G. Denniston's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

Nevada Metallurgical Works.

NO. 28 STEVENSON STREET,

Near First and Market Streets, S. F.

O. A. LUCKHARDT, Manager.

ESTABLISHED 1869

Ores worked by any Process.

Ores Sampled.

Assaying in all its Branches.

Analyses of Ores, Minerals, Waters, etc.

Working Tests (practical) Made.

Plans and Specifications furnished for the most suitable Process for Working Ores.

Special attention paid to Examinations of Mines; Plans and Reports furnished.

(Formerly Hubbs & Luckhardt,

Mining Engineers and Metallurgists

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russian iron in Quartz Screens. Planished iron screens at nearly half my former rates. I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass. Zinc and other metals punched for all uses. Inventor and Manufacturer of the celebrated Slot Cut or hurred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,

221 & 223 First St., San Francisco, Cal.

JOHN W. QUICK, Proprietor.

WINCHESTER HOUSE,

44 Third Street, San Francisco, Cal.

This Fire proof Brick Building is centrally located, in the healthiest part of the city, only a half block from the Grand and Palace Hotels, and close to all Steamboat and Railroad Offices.

Laundry Free for the use of Families.

HOT AND COLD BATHS FREE.

Terms, Board and Room, \$1.00 per Day
And Upward.

Rooms with or without Board.
Free Coach to the House
J. POOLEY.

BALDWIN LOCOMOTIVE WORKS.

ANNUAL CAPACITY 800. ESTABLISHED 1831.

LOCOMOTIVE ENGINES!

Adapted to every variety of service, and built accurately in standard gauges and templates. Like parts of different engines of same class perfectly interchangeable.

Broad and Narrow Gauge Locomotive, Mine Locomotives by Steam or Compressed Air, Plantation Locomotives, Noisless Motors for Street Railways, Furnace Locomotives, etc.

BURNHAM, PARRY, WILLIAMS & CO., Proprietors, PHILADELPHIA, PA.

**KROGH'S MINING HORSE-POWER HOIST**

Is known to be the best Horse-Power Hoist now made. It is strong and durable.

The drum will carry 1000 feet of five-eighths steel rope. It can be used to run a pump or blower, in conjunction with hoisting.

Manufactured by F. W. Krogh & Co., 51 BEALE ST., San Francisco.

**JOSHUA HENDY MACHINE WORKS,**

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

**"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.**

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. O. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,
And will furnish descriptive Catalogues and quote prices upon application.

SAN FRANCISCO TOOL CO.,
 MANUFACTURERS OF
IRRIGATING PUMPS
 —AND—

Machinery of all Kinds.

 —PACIFIC COAST AGENTS—
BABCOCK & WILCOX
Patent Water Tube Steam Boilers.

Estimates Furnished on Application.

12 Cortlandt St., New York.

FRANCIS SMITH & CO.

Manufacturers of

Sheet Iron and Steel PIPE!

ALL SIZES.

130 Beale Street, San Francisco, Cal.

Iron cut, punched and formed, for making pipe on ground. All kinds of Tools supplied for making Pipe. Estimates given. Are prepared for coating all sizes of Pipe with a composition of Coal Tar and Asphaltum.

FOR SALE.

One Ohmen's 12x12 Automatic Engine; best style in use. Also, 1 Boiler 48 in. x 16 ft. Both nearly new. Apply to **J. W. QUICK, 221 First St., (Top Floor) San Francisco, Cal.**

IMPROVED FORM OF HYDRAULIC GIANTS.

THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture. We guarantee purchasers of this form of Giants against all costs, expenses or damages which may arise from any adverse suits or actions at law. We are further prepared to furnish Single-Jointed Giants when required. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent on application.

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

FRISBEE-LUCOP MILL CO.,

—MANUFACTURERS OF—

Centrifugal Roller Steel Mills,

FOR PULVERIZING ORES, WET OR DRY,

For Amalgamation or Concentration, and for Manufacture of Cement, Fertilizers, Paint, and all other purposes for which grinding or pulverizing is required.

Send for Catalogue and Price List to

FRISBEE-LUCOP MILL CO.,

145 BROADWAY, NEW YORK.

THE ROLLER ORE FEEDER

(Patented May 23, 1882.)

THIS is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, April 17, 1890.

Continued clear weather and improved inland transportation facilities bring in more trade. The volume of goods going out on orders is large, larger than at this time in 1889.

The iron-molders' strike is still on. Founders appear more cheerful and express confidence in their ultimate success. This opinion is grounded on their securing more molders as each week rolls around.

The money market shows continued ease. Remittances from the interior are fairly free, while the call for accommodations is not very marked. Wools are moving freely, consequently the demand for funds on warehouse receipts from that source is not as large as it was at this time in 1889. The moving of the clip gives exchange on New York, which is very opportune considering that very few of our other products are being shipped to the East owing to being out of season.

MEXICAN DOLLARS.—The demand continues light. The market has advanced in sympathy with an advance in silver. The market closed today at 78c@78½c. The last steamer for China took out \$74.98.

SILVER.—The Congressional Committee, having the silver hills in charge, have virtually agreed upon the Senate bill. This is equivalent to passing both branches of Congress; no doubt to this is due the strength of silver in the markets of the world, and which now promises, with the passage of the bill and its approval by the President, still higher prices, with, eventually, its gradually working up to par. The advance in silver abroad and sterling bills going up, are bringing exporters into the market who naturally look forward to an improved demand later on for exchange purposes.

The local market has advanced until 99 cents is paid by the Mint. An exporter quoted us this morning over \$1 as his price to-day, yet he stated the market was feverish and excited abroad, which might make the price fluctuate. To-day's telegrams quote the London market at 46½d, and the New York market at \$1.75.

QUICKSILVER.—Receipts the past week aggregate 94 flasks. The overland shipments in last month aggregate 27,000 lbs. The home demand continues free, said to be larger than for several years past. The market is reported firm at unchanged quotations. There was shipped by sea the past week 200 flasks in transit to Mexico.

BORAX.—The overland shipments last month aggregate 1062 cts. The market continues firm at full quotations. The East reports a steady market. Last week there was shipped by sea 1994 lbs. to Mexico.

LIME.—Receipts the past week aggregate \$295 bbls., and exports by sea 250 bbls. to Kahului. The market shows continued activity under a large increasing home consumption.

LEAD.—The exports by sea the past week aggregated 90,653 lbs. to New York. Receipts here show a slight increase. The consumption is reported to be larger. At the East the market has receded under a lighter demand and fair receipts.

TIN.—Imports the past week aggregate 2268 ingots from Australia, and the exports 4061 lbs. to Victoria. Cannerymen are busy. It now looks as if more cans will be made this year than there were in 1889. Both salmon and fruit canners look for a more active season. In roofing and other tin it is claimed that the consumption is enlarging. London cable advices report the stock at shipping points 538,000 boxes against 351,000 boxes at the corresponding time last year.

IRON.—In the local market there are no new features to note. The founders are gradually increasing the number of molders at work, and as a result more iron is going into consumption. While there is an easier tone to the market, yet quotations remain unchanged. Eastern advices are confirmatory of large quantities being delivered; the low prices, about the same that were current the forepart of last summer, induce buying. Bessemer pig sold as low as \$17.65, but closed at \$18 cash bid. Southern furnace-men continue their close competition in the northern markets, underselling the home furnace-men.

COPPER.—The markets, the world over, are reported strong, with stocks being steadily reduced. The enlarged demand for copper is due to the increasing uses it is being converted to. This naturally encourages mine-owners, who see in the future not only a stable but a strong market. The consumption in this country has increased to such an extent that the export shipments from the Atlantic seaports are greatly reduced.

COAL.—Imports the past week aggregate as follows: Newcastle, N. S. W., 2213 tons; Tacoma, 5200; Seattle, 4561; Nanaimo, 2300; Departure Bay, 3500; Coas Bay, 400; overland, 20; total, 13,194 tons. The market for steam and gas coals is very strong, with light stocks here and to arrive. Coast coals are steady. The output of the collieries is so regulated as not to produce too much of a surplus. The railroads are using quite largely coal coals, which aids materially in keeping the market well in hand.

Eastern Metal Markets.

By Telegraph

NEW YORK, April 17, 1890.—The following are the closing prices the past week:

	Silver in London	Silver in New York	Copper	Lead	Tin
Thursday	44½	98½	\$14 25	\$1 7½	\$19 85
Friday	44½	98½	14 25	1 7½	19 85
Saturday	44½	98½	14 25	1 7½	19 85
Sunday	44½	98½	14 25	1 7½	19 85
Tuesday	44½	98½	14 25	1 7½	19 85
Wednesday	44½	98½	14 25	1 7½	19 85

NEW YORK, April 15.—Quicksilver and borax are unchanged. The metal markets were generally dull, copper being the only item showing firmness; Lake, held 14½@14¾c, refused carting 12½@13¾c. Pig lead, about 300 tons, \$3.85.

The manager reports that 495,000 people have visited "California on Wheels" up to April 9th.

Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Assessment Notices.

ACOME M. L. AND MINING COMPANY: Location of principal place of business, San Francisco, California. Location of Works, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1890, an assessment, No. 10, of 3 cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of May, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, THE 9th DAY OF JUNE, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. M. BUFFINGTON, Secretary.
Office, Room 11, No. 303 California Street, San Francisco, California.

GOLD HILL MINING COMPANY: Location of principal place of business, San Francisco, California; location of works, Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of April, 1890, an assessment (No. 9) of Twenty-five Cents per share was levied upon the Capital Stock of the Corporation, payable immediately, in United States Gold Coin, to the Secretary, at the office of the Company, Room 20, Phelan Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of May, 1890, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 10th day of June, 1890, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
C. A. GROW, Secretary.
Office, Room 20, Phelan Building, San Francisco, California.

We quote shipments since our last and shall be pleased to receive further reports: Mt. Diablo, April 16, \$9084; Cons. California and Virginia, 12, \$56,147; Overman (for March), \$13,709; Savage (for March), \$28,855; Hanauer, 11, \$1975.

Attention, Southern California Miners.

WORKS FOR SALE. The Works are situated at Daggett, Cal., in the Calico Mining District, and on the side-track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power Engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to GILLISPY & CHILDS, 123 California St., San Francisco.

DEWEY & CO. PATENT SOLICITORS. 220 MARKET ST. S. F. ELEVATOR 12 FRONT ST. S. F.

HORACE D. RANLETT, Ores, Mining, and Commission, 420 Montgomery St., S. F.

Ships under advances to smelting works in Boston, New York, Baltimore and Liverpool. Twenty-one years' experience in Shipping Ores and Managing Mines. Solicits Consignments of Copper Produce and Management of Mining Matters. All business conducted on Cash Basis. Purchase and shipment of Mining Supplies a SPECIALTY. Sales of Developed Copper Mines undertaken. Business Manager of UNION COPPER MINE, Copperopolis, Cal.; NEWTON COPPER MINE, Amador Co., Cal.

H. M. RAYNOR, No. 25 Bond St., NEW YORK.

ESTABLISHED 1859 FOR ALL Laboratory AND Manufacturing Purposes. Wholesale and Retail. Native Platinum and Scrap purchased.

Paul's Dry Amalgamating Barrel Process.

The undersigned is prepared to erect, or furnish drafts for erecting, machinery, also instructions for working or by the new patented DRY AMALGAMATING BARREL PROCESS. I assert the ability to overcome EVERY difficulty connected with amalgamating the precious metals, more especially gold, and to add from 25 to 100 per cent to the FREE GOLD yield of any mill working WET. Being the original inventor of dry amalgamation, I have spent over 20 years perfecting the system, now brought to a wonderfully efficient, inexpensive and practical one. I caution all parties against infringements. For further particulars, address ALMARIN B. PAUL, Middle Creek P. O., Shasta County, California.

Smelter For Sale or Exchange.

One 60-ton, wrought iron, water-jacket Smelting Furnace (36"x60" at the tyres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 28, Elko, Montana.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$900, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), London, October 8, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrator, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if used be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Location of Works, Orass Valley, Nevada Co., Cal.

ORASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,
(Signed) Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

The Thompson Engine.

An Independent Cut-Off Engine of California Design.

On this page to-day we publish a cut of the I. F. Thompson automatic independent cut-off slide-valve engine. For many years engineers have felt the want of a more simple and less complicated form of independent cut-off engine than has heretofore been in use. For instance, an engine that will give the same or better results by a more simple and direct method of operating than the Corliss. The Thompson engine supplies that want, and it combines great simplicity of construction with close economy in the use of steam. The sole-plate or frame of the engine is a combination of the box-form and the Corliss. The cylinder is attached to the frame with a heavy strong hood, and has in its center a substantial foot that bolts to the foundation. Said cylinder and also the steam chest are nicely lagged with black walnut.

Between the lagging and cast iron there are two inches of asbestos and felting, to prevent radiation of heat.

The heat of steel and phosphor-bronze enters largely into the construction of the working parts. The entire engine is well finished throughout, being built heavy and strong.

There are four plain, simple slide-valves, two steam and two exhaust, all working and capable of being set entirely independent of each other. They lie flat upon their seats with their faces down. The exhaust valves are operated by a plain straight-line connection, and when they are once properly set, remain constant, and do not alter their relative positions to each other. The steam-valves work entirely independent of the exhaust valves, and also of each other; they are operated by an arm that is attached to the main valve-rod. There is a piece of hardened tool-steel bolted to the inside end of said arm, that engages with a corresponding piece of steel that is attached to a hinged trigger, which moves with and is part of the valve-stem which operates this particular valve. On the outward end of said valve-stem there is a dash-pot or air-cush-

AT THE MOUTH OF THE TUNNEL OF THE HOGSBACK DRIFT MINE.—See page 286.

ion of peculiar construction, having piston and snap-ring to keep it tight. On the opposite end of the same stem is a small solid steam-piston, that extends through its stuffing-box into the steam-chamber, and is there attached by means

of a large brass nut to the main steam-valve, thereby making the line complete and solid from the air-cushion on the outside to the steam-valve on the inside of the steam-chest.

Then, when the main valve rod is carried

forward by the action of the eccentric, the steels on the above described arm and trigger engage with each other, and carry forward the attached steam valve to any point that may be required to cut off at the moment.

Then the two steels that are attached to the arm and trigger are released from each other by the action of the governor. At that moment the steam in the steam chest, acting on the small piston to which the valve is attached, throws it outward, until its motion is arrested by the air cushion on the opposite end of stem, thereby accomplishing an instantaneous cut-off.

Attached to the top of the trigger are two small tappets, which, when the stem is carried forward, travel up an incline plane or wedge, gradually raising the trigger until it is released from the moving arm. Said wedge is attached by means of a bell-crank and rod to the governor, and advances or recedes as the governor-hells raise or lower, thus

(Continued on page 287.)

THE THOMPSON AUTOMATIC INDEPENDENT CUT-OFF SLIDE-VALVE ENGINE.

The Deep Gold Placers of California.

NUMBER IV.

[Written for the Press and Copyrighted 1890, by HENRY G. HANES, F. G. S. A., F. G. S.]

Channel Filling—Gravel, Sands, Silts and Slickens.

It has been shown that a large proportion of the channel filling is finely divided. The following mechanical analyses, including one from Ohio, show the general character of these sediments. Of course large boulders could not be included. A calculation of the percentage of boulders could only be made in a rough way while piping was in progress in some hydraulic mine. I am not aware that such an estimation has ever been made. A large proportion of the boulders weigh many tons each and the miners are compelled to blast or remove them with large derricks operated by water-power.

Mechanical Analyses.

- A—Dutch hydraulic mine, near Laporte, Plumas county.
- B—Edman mine, Plumas county, California.
- C—Concentrates, Cherokee Flat, Spring Valley hydraulic mine, Butte county, California.
- D—Gravel, Nevada hydraulic mine, Chalk Bluffs, Nevada county, California.
- E—Ohio Glacial Drift, from Butler county, sent by D. A. McCord of Oxford, Ohio.
- F—Polar Star mine, Dutch Flat, Placer county, California.

	A	B	C	D	E	F

- A 1—Pebbles from 1/2 inch to 1 inch in diameter, 3 per cent were quartz, 40 per cent were rounded and 60 per cent angular and sub-angular.
- A 2—80 per cent quartz, 20 per cent rounded, 16 per cent sub-angular, 64 per cent angular.
- A 3 to A 5—Nearly all quartz, all angular.
- A 6 to A 9—All quartz, all angular.
- B—All portions contained gold.
- C—Contained magnetic sand with zircon, platinum and gold.
- A second portion treated in Schultze's apparatus gave the following results:

	Per cent.
N—First light portion	23.93
O—Second light portion	40.99
P—Coarse, heavy portion	7.14
Q—Remained in apparatus	27.56
R—Amalgam—gold 0.10, mercury 0.23	0.33
Total	100.00

Portion "N" was quartz in angular fragments, black sand in obscure crystals or rounded forms, small masses of globular pyrites in minute crystals, with crystals of pyrite attached. But few of the black granules were magnetic. "O" much the same, but with more black grains, some of which seem to be obsidian, a few doubly terminated quartz crystals and clusters of pyrite crystals. "P" nearly the same in appearance but larger grains; all angles of pyrite un worn. "Q" This was the most interesting portion, consisting largely of perfect crystals of zircon and black grains, a few green and red in the following proportion, picked out by hand: Black grains, 62; red grains, 1; zircon, 37. The black grains were heated to redness, upon which a few became magnetic. When ground in an agate mortar, a brown powder was formed, which resisted the action of acids. In a head of borax before the blowpipe, a strong chromium reaction was obtained. "R" was gold amalgam left in the sample, but which could easily have been removed by simple concentration. The gold was equal to 2.133 pounds avoirdupois to the ton of 2000 pounds, having a value of \$643.01 to the ton. D. This sample was taken from a pillar near the surface, and is considered a fair sample of the gravel worked in the mine for 15 years. A proper reduction for the large boulders which are plentiful in the mine, if it could be

calculated, would reduce the percentages of all the parts obtained in this analysis. After separation of the larger pebbles and the coarser gravel, the finer portion was carefully washed; no gold was found, but a very heavy grayish sand remained on the batea. This was examined microscopically and found to be composed of some black non-magnetic particles, a white mineral resembling quartz, a few red crystals, and others resembling rough diamonds; a small portion of magnetic sand, and an abundance of beautiful crystal of zircon. The red crystals were obscure, being somewhat worn on the edges. Those thought to be diamonds had that peculiar steatite luster and appearance common to rough diamonds, and were extremely brilliant to reflected light. A whitish substance floated on the water in which the dirt was washed; this, under the microscope, was found to be pine sawdust, and being foreign, was not weighed or estimated. D 1 was large pebbles, 89 per cent of which were quartz; they were all rounded as if water-worn. D 2 was coarse gravel, between half an inch and one inch in diameter. It contained 63 per cent of quartz; nearly all the gravel was rounded. D 3 contained 57 per cent of quartz. The other portions consisted largely of quartz; nearly all the grains were angular and not in the slightest degree worn. D 9 was fine slickens, which, being allowed to dry in a mass, became hard and broke with a fine-grained conchoidal fracture like lithomarge. Examined microscopically, it had the general appearance of the others. There should be a distinction made between "mining debris" and "slickens." The former consists of boulders and heavy particles which remain near the mines; the latter is finely divided silt, so light that it floats to a long distance, and only settles in stagnant water or in streams that move very slowly. E 2, fragments from 5 to 20 mm., all somewhat rounded, none of them quartz, 62 per cent limestone, not by weight but by counting particles. E 3 fragments nearly all angular, a few white quartz which are rounded. The angular fragments seem to be limestone. There were several fossil bivalve shells and a few granules of sandy quartz had numerous metallic particles imbedded; 67 per cent effervesced with hydrochloric acid. E 4 all angular; fragments of fossil corals, limestone and quartzite and fine-grained crystalline rocks; but little quartz, and this angular. E 5 same general character as E 4 but smaller grains; schists, sedimentary rocks, and fossil corals; one of the chalcedonic spheres seen so abundantly in E 9 was observed. E 6 nearly all angular; largely quartz most of which is crushed and shows conchoidal fracture, a few worn ones, some of the red mineral seen in E 9. E 7 nearly all quartz, most of which is angular, many sperminolite-like globules (chalcedony?). E 8 does not differ materially from E 7 except in size of particles. E 9 was very finely divided quartz fragments in a nearly amorphous powder; no organic forms could be discovered except limestone in small quantity shown by effervescence in acids. Concentrates from E 9, one gram; consists largely of nearly transparent quartz all in angular fragments, some black and shining particles, others oolite-like, others red-garnet like, broken fragments such as are found in California hydraulic sands, many globular like drops of water but chalcedonic in character; do not seem to be rolled; they are rough on the outside some, transparent or waxy, generally about the same size, none broken; there are no crystals and no metallic particles. F—A sample of 50 pounds taken from near the surface which had never been disturbed by the hand of man. The gravel was colored ocher yellow by oxide of iron, a great portion of which washed off with water. The large pebbles were, with one exception, quartz, with peculiar striations not due to mere water-washing, but deeply grooved as if held in a natural vise while another body moved against them, which seems to be a clear indication of glacial action; the exceptional pebble was serpentine. No noteworthy feature was observed in the microscopic examination of the fine gravels and sand, except the sharp and unworn angles and edges. An examination of the portion left on the batea was unusually interesting. There were some dark-colored and very heavy particles which proved to be battered hard-shot; a few colors of gold were seen, with a considerable quantity of black particles, constituting about 50 per cent of the whole, but few of which were magnetic. There were also a few particles of byssaline quartz and much sharp-angled quartz sand, but no zircon. As compared with dune sand, it was much less worn, the particles being nearly all angular and sharp; the black particles were less angular than those of the quartz. The gold was somewhat coated, the coating being white like silica, but not to the extent common to much of the gold in the placers of the State. Portion F 7 as seen under the microscope was composed of particles made up of exceedingly fine atoms, all of which were quartz, sharp and angular, and colored yellow by oxide of iron. Boiled in nitro-muriatic acid and well washed, the quartz became pure white and the acid solution gave a strong reaction for iron. It

is easy to understand how such a deposit could form beds of yellow ocher when concentrated from sand and gravel by long-continued action of water in motion. The following is the result of examination of samples of sands, silts and slickens, collected from various parts of the State, selected from several hundred in my cabinet. All were gathered by myself at the localities named: AA—Stratified sand, Indiana hill, Gold Run, 60 feet above bedrock, rather a coarse sand; nearly all passes through a 20-mesh sieve; shows no special characteristics. BB—Medium sand used for building purposes, American river, at Twelfth-street bridge, Sacramento. Nearly all passes a 40-mesh sieve. It contained a few magnetic particles, considerable flake mica, mostly angular quartz with some rounded grains. CC—River silt, American river, Sacramento. Used to fill lands to grade. Composed principally of angular quartz; contained a large quantity of mica and woody fiber. DD—Silt from Alviso, Santa Clara county. Blackens after heating to redness; after long-continued ignition becomes red; mostly rounded quartz granules resembling dune sands of San Francisco, but contains considerable mica in scales. EE—Sand from Alameda, Alameda county. Resembles San Francisco dune sand, all the particles rounded and water or wind-worn; nearly all quartz. FF—Fine sand from bank of river opposite Marysville, Yuba county. Sharp, angular fine particles, containing a few scattered scales of mica. GG—Sand overlying (JJ) American river, Sacramento. Coarse, mostly angular quartz, some well-rounded grains and a few flakes of mica. HH—Sand North Bloomfield hydraulic mine, Nevada county. Quartz sand coated with a yellow, finely divided ferruginous slickens, not plastic but easily washed away, leaving sharp angular quartz sand, and revealing the presence of considerable sandy magnetite. This material resembles the auriferous matter found in the Edman mine, Plumas county. II—Samples of auriferous quartz, crushed by myself and passed through a 50-mesh sieve. Identical in appearance with hydraulic sands. JJ—Slickens, American river, Sacramento. Very finely divided, all particles angular, including some flakes of mica. Color, buff; blackens when heated to redness, partly regains color on cooling; this experiment was several times repeated. KK—Slickens, American river, Twelfth-street bridge, Sacramento. Very fine, yellowish colored, the particles were partly cubical; edges somewhat rounded; different from JJ, which is from nearly the same locality; evidently river mud. LL—Slickens, North Bloomfield hydraulic mine, Nevada county, taken from the bedrock; somewhat plastic; when treated with water, softens; a yellowish, very fine silt floats, leaving a coarse, nearly pure quartz sand; perfectly angular. MM—Slickens, North Bloomfield, Nevada county, yellowish colored; with water not at all plastic, a golden-yellow fine powder washed away as in HH, leaving coarse and fine angular quartz sand; no magnetite. NN—Slickens from a lake in Steep Hollow, near Chalk Bluffs, Nevada county, not plastic; colored yellow by oxide of iron; principally quartz sand; granules all sharp angular. OO—Pipeclay, North Bloomfield, Nevada county, snow-white and very homogeneous. Before blowpipe with cobalt solution becomes deep blue; when wet is very plastic; under the microscope with a high power is seen to be largely very finely divided angular quartz; when washed, leaves no fine sand. Chemical analyses of silts and slickens from California hydraulic mines show them to contain:

	Per cent.
Silica	67 to 90
Oxide of iron	4 to 11
Alumina	3 to 12
Lime	
Oxide manganese	from trace
Magnesia	to 2 per c.
Potash	
Soda	
Specific gravity	2.3 to 2.66

The following extracts, which have a special bearing on this subject, are from one of my reports (Second Annual Report of the State Mineralogist of California, Sacramento, 1882): "From the examination of the hydraulic sands it is fair to infer that the same force that crushed the rocks, set the gold free, flattened the grains, and coated those which passed between the rocks and the grinding loe. "When I made the discovery by the use of the microscope that all the sands in the hydraulic mines were angular and not rounded by the action of water, as I expected to find them, I came to the conclusion that the river-beds had not been filled by force of water alone as generally supposed, but that we must formulate a new theory based on the new discovery. I naturally looked to ice as the agent and attributed the filling of the beds and the disintegration of the rocks to the action of glaciers moving over the land. This view, while it would account for most of the phenomena, did not account for all. The rounded boulders were a stumbling-block which could not be overcome, and their formation, by long-continued action of water, could not be made to harmonize with the angular condition of the sands. "Observations made in studying this very

interesting subject seem to strengthen the opinions of the advocates of the theory of extensive intermittent and almost universal glacial action on the earth's surface; no theory I am familiar with so perfectly accounts for the present condition of this sand. I find the resemblance between the finer sands and the diatomaceous earth of the State so marked that I am inclined to trace a connection between them. After making a comparison under the microscope, I returned to the former and made a critical and long-continued search for organic forms, feeling to a certain extent disappointed when I found none; yet the resemblance is so striking that it would seem almost proved that the hydraulic gravels and the diatomaceous earths have a common origin; the latter being brought down by streams and deposited in some quiet ancient lake, in which diatoms living and dying left their tiny skeletons in the slowly deposited silt. "It is well known that certain strata in the diatomaceous earths contain these interesting forms in greater quantities and in more specific varieties than they are found in others, which would seem to indicate that they were deposited in different geological eras, or at least at different intervals of time. "It is probable that the diatoms derived the silica required for their shells from quartz held in suspension or solution in water. Thinking this over, another experiment was made which established still stronger evidence as to the similarity between the finer silts and the diatomaceous earths. A portion of the former was holed in a silver dish with a strong solution of caustic potash. A large quantity of silica was dissolved, which proves that at least a portion of the silica had changed from its condition of quartz, and had assumed the nascent or soluble state. It is well known that diatomaceous earth is largely soluble in caustic alkalis, advantage being taken of it in the production of silicate of soda and potash on a large scale; and it is equally well known that quartz is only slightly acted on, except after being oxidized, and under pressure. I am aware that finely powdered quartz, long heated in boiling potash lye, slowly changes to the soluble state and enters into solution. In this experiment the solution was immediate and copious."

Coast Industrial Notes.

NEARLY 1000 men are employed in the coal mines at Roslyn, and the daily output is from 750 to 900 tons. ENOUGH of the steel rails for the Oakland and Berkeley electric railroad have arrived to start the work of track-laying ahead again. THE quarrymen at Penryn, Placer county, now work nine hours for a day's work, without change of wages from the ten-hour day. ON the 14th inst. the machine shops of the Northern Pacific R. R. Co. at Ellensburg, Washington, were destroyed by fire. Loss, \$100,000. ABOUT 250 men are now engaged in the work of construction of the suburban section of the Piedmont cable road. It is said that the cost of the entire system, including the Fourteenth-street line, will approximate \$1,000,000. IN the last few weeks ten ships and barks have left this port for various points in Alaska. On these vessels over 1000 Chinese have taken passage. They have gone to Alaska under contracts to work in the salmon canneries and fisheries. THE steamer Queen is fitting out at the Union Iron Works for the Alaskan route. Her deck-house is being extended and will contain 33 more staterooms, making 96 in all. She will run as an excursion boat from the Sound to Alaska. THE contract for the erection of the ten-story Crocker building on the Post and Market street corners has been let to Mahoney Bros., who will begin work at once. The cost of the building when completed, it is estimated, will be considerably over \$1,000,000. ANOTHER industry is to be located in Oakland. The crescent works of the Southern Pacific Co., until some weeks since established at San Pedro, Los Angeles county, and visited by fire there, will be situated in the Peraltastreet yards, by the shore of the estuary. NATURAL GAS has been found on Piries' ranch near Nordhoff, Ventura Co. There is no question of the existence of natural gas in many places in Ventura county in quantities sufficient to be worth looking after, but it goes to waste, except in Santa Paula canyon, where it is used by the Oil Company to run engines at their pumping station. CLOSE on to a million of dollars will be spent at Mare island on the completion of the monitor Monadnock. The Ironsides, Thetis, Alert and Ranger are all undergoing extensive repairs at the Navy-yard. It is expected that the Adame will arrive shortly. The Marion is also on the way. Both of these vessels will also need considerable repairing. THE lathers went on a strike last week for higher pay. Those who work by the day want an advance from \$2.50 and \$3.50 per day to \$3.50 and \$4, while those working by the piece want an advance from \$1.50 per thousand to \$1.75. The contractors, with very few exceptions, have decided to pay the advance in wages asked by the employees. The contractors say that the lathers strike about this time every year. During the dull season the

lathers work for very low wages, and when business picks up they strike for more. They will, according to the statements of the contractors, be back to their old figures in a few months, after the present building boom has subsided.

THE Watsonville *Pajaronian* says: The beet factory's lime and potash vats will be cleaned out before the next season's run begins, and it is estimated that there will be at least 700 tons of the lime fertilizer for shipment to the Sandwich Islands. Potash will also go to the islands. There is a scarcity of lime there, and this fertilizer will sell for a good price.

PALADINI & Co., owners of the fishing steamer U. S. Grant, have contracted with Wm. Stone, the ship-builder, to build for them another steamer to be used for fishing purposes. The dimensions of the new craft will be: Length, 65 feet; beam, 22 feet; depth, 9 feet. Her hull will cost \$5000 and her machinery about \$7500, and she will be completed in about two months. When finished she will sail in concert with the Grant, fishing off the port. The two will steam along about 500 feet apart and drag between them an enormous net.

The machinery from the Niles Tool Works, Hamilton, Ohio, has arrived at Mare Island Navy-yard. The machinery consists of three armor-plate bending-rolls to be used in the Mare Island Navy-yard. They can bend plates cold 4 inches thick and 27 feet wide of wrought steel. The largest of the three is 33 inches in diameter, with a 27 foot face, and 13-inch journals 3 feet long. The two smaller are 26 inches in diameter, with the same face and same length journals, 13 inches in diameter. The largest in itself weighs 86,700 pounds. The freight bill alone amounted to \$10,000.

CHARLES WHITE has established his shipyard, formerly at North Beach, on Oakland Creek. A two-story frame building has just been completed, containing 15 large sleeping-rooms, with dining-room, kitchen and reading-room, besides quarters to be used as offices, model-rooms, drafting-rooms, etc. On the banks of the estuary is a saw-mill, which is nearly completed. In it is all the latest and most approved machinery for ship-building. The black-smith-shop is located in the same building, and a large engine and 60-horse power boiler will furnish all the necessary power for hauling lumber and drawing vessels up on the ways. The marine ways have been completed, and at present 25 men are employed at the yards, and this force will be increased to 100 as soon as Mr. White can put them to work. One vessel is being constructed now. The vessel is one of 45 tons, and is being built by the Arctic Packing Company for salmon fishing in Alaskan waters. Mr. White has contracted for four vessels in all so far. One will be a four-masted barkentine, to be launched in August. Another will be a schooner, and a third a steamer. The timber for all these vessels now lies in the harbor ready to be used.

THERE are 10 broom factories in this city, the business being principally in the hands of two or three firms. Then, scattered throughout the country, there are, for example, two in Sacramento, two in San Jose, three in Stockton, two in Los Angeles and one in Red Bluff, with some others. The manufacture of brooms is also carried on to a considerable extent at the Industrial Home for the Blind at Oakland. Taken together, the private factories in the city and the blind asylum may be set down as having an output of about 200 dozen brooms a day, or 62,400 dozen—say in round numbers 750,000 brooms—per year. The brooms, which vary in weight all the way from one and a third to two pounds each, take about one ton of corn to every 100 dozen brooms. The number of hands employed in this city is about 150, 50 of whom, mostly white men, are in the pay of one firm, the balance being divided up among the smaller establishments and consisting principally of Chinamen. At present from \$75 up to \$120 per ton is being paid for broom-corn by the factories, with prices promising to advance owing to the scarcity of the California article as a result of the lesser area planted last year. The estimated production by the State is set down at about 500 tons for the last year, where in other years it has reached up to 1000 tons.

A MOVEMENT is on foot among the salmon cannery men and agents to come to some understanding whereby the production of the coming season will not be as large as it was last year. The most careful estimates show that there is still a stock ranging from 200,000 to 250,000 cases of 1889 salmon in the hands of the producers. Advice from Portland, dated April 15th, says: Owing to a dispute between the cannery men and the Fishermen's Union no salmon are being canned on the Columbia, and the headquarters of the salmon business is at present in this city. There are a good many fish running in the Willamette, and parties are fishing despite the union and selling tone of fish here for three cents a pound. The fish are being salted in barrels and shipped by the carload for Germany and Russia, where the salt will be extracted by some peculiar process and the fish canned, thus avoiding the duty on canned goods. Unless the trouble between the fishermen and the cannery is settled, a very large amount of salmon will be disposed of in this way. The fishermen on the Columbia years ago got 50 cents a fish. They organized as fish became scarcer and fishermen more numerous and got 50 cents, then 75 cents and finally \$1 a fish. This year they are striking for \$1.25.

Legal Points in Levee Building.

There was filed by the Supreme Court, recently, an interesting decision in the case of E. McDaniel, appellant, vs. M. Cummings, respondent. The defendant owns the west half of a certain section, No. 26, in Colusa county. Plaintiff owns land adjoining on the west. Still farther to the west, at a distance of about two miles from plaintiff's land, the Sacramento river flows from north to south. The land next the river is the highest, there being a gradual descent from the river bank to and beyond the land of defendant. When the river rises above the level of its banks, as it generally does several times during every rainy season, the water flows off to the east or southeast, across the land of the plaintiff, and other lands similarly situated, to and across the land of defendant and other lands in the same relative situation. It does not flow in any narrow or defined channel or channels, but in a broad sheet covering a wide surface.

When the river falls below the level of the banks the overflow cannot, of course, find its way directly back into the stream, and consequently the lands near the river are drained by the spread and flow of water toward the east and southeast, across the lower lands, such as those of defendant. Left unobstructed in their natural and accustomed flow, these waters soon pass beyond the plaintiff's lands, leaving them fit for cultivation. But recently the defendant, without intending to injure the plaintiff, and acting upon the bona fide belief that he had the right so to do, commenced and was proceeding to complete a levee or embankment along his west line, the necessary effect of which will be to prevent the flood-water from passing over his land, and to set it back upon the plaintiff's land, causing it to cover a larger area thereof, and to remain thereon for a longer period than it otherwise would.

The plaintiff thereupon commenced an action to enjoin the defendant from erecting or maintaining said levee. A temporary injunction was issued upon the filing of the complaint. Afterward, on motion of the defendant, and upon affidavit showing the state of facts above set forth, the Superior Court dissolved the injunction on the ground that the defendant in erecting and maintaining his levee was acting within and according to his rights. From this order dissolving the injunction plaintiff appealed, and on September 12, 1889, an opinion was filed by the Supreme Court reversing the order upon the authority of *Ogburn vs. Connor*, 46 Cal., 346. A rehearing was subsequently granted upon petition filed on the part of the defendant, in which the correctness of the decision in *Ogburn vs. Connor* is assailed, as is also the construction given to Section 801 of the Civil Code.

Chief Justice Beatty, who writes the opinion, says: "I think there can be no doubt that we were in error in holding that Section 801 of the Civil Code gives to the owner of higher land an easement for the discharge of surface water upon lower adjoining land. That section merely enumerates the different kinds of burdens or servitudes upon lands that may be attached as incident or appurtenant to the other lands, or, in other words, it is a mere definition of easements appurtenant, and makes no pretense of prescribing or regulating the manner of acquiring them."

"If the owner of the land next to the river will not, either by himself or in combination with those behind him, erect a levee on the bank, he ought not to be allowed to prevent them from protecting themselves, merely because by so doing they prevent his higher land from being drained of the flood waters as rapidly as it otherwise would be. Because his land may be cultivated without artificial protection, he ought not to be allowed to prevent others from using proper means to make their lands productive; and what is true of the owner of the river-bank is true in the same sense of each successive owner back of him. It is the interest of all to combine and share the expense of placing a levee on the bank, by which all will be protected; but if those in front will do nothing for themselves, they must not be allowed to stand in the way of those whose necessities compelled them to act. Order affirmed."—*Record-Union*.

MINING ENGINES.—The Chicago branch of the Lidgerwood Manufacturing Company, New York, reports the general state of trade as being very good. They have recently closed many large orders, among which we note the following: A large double friction drum mining engine and boiler to the Shafer mine of Crystal Falls, Mich., a duplicate of same to the Mansfield Iron Mining Company of the same place, and to the Nanaimo Mining Company of Iron River, Mich., a large single drum, double cylinder reversible mining engine, besides a large double friction drum mining engine with boilers. They have also sold a large double cylinder reversible hoisting engine to the Valley Mining Company of Bessemer, Mich., four large reversible hoisting engines to the Schlesinger (Iron mining) syndicate, and many small exploring engines intended for the Lake Superior mining regions. The recent boom in the iron world has caused a great deal of activity among manufacturers of mining machinery, and especially so in the case of the Lidgerwood Manufacturing Company.

Sampling Auriferous Quartz.

A Simple Working Test for Amount of Gold.

In the Fifth Annual Report of the State Mineralogist of California, there appeared an article written by Melville Attwood, E. q., of this city on "A Simple Working Test for Determining the Quantity of Gold Mechanically Combined with Auriferous Vein-Matter." Mr. Attwood has been for the past 50 years more or less practically engaged in gold mining, and the great importance of some simple and reliable test has constantly presented itself to his notice. We have long felt and experienced the want of some practical and correct way of estimating the value of auriferous vein-matter, or gold quartz, which would demonstrate what could be obtained by careful milling—a test that could be applied at the mine, of so simple a character, that those witnessing the trial, though not conversant with mining or milling, would be able to judge of the result, and, if necessary, satisfy themselves of the safety of their money, in case they wished to invest for the further development, or even the purchase of the mine. Mr. Attwood at last determined to devise some plan to meet the requirements, and after exhaustive experiments he has in a great measure succeeded. From his article, above referred to, we condense the essential features, omitting that which relates to the occurrence of gold, etc.

The gold quartz from which the working test is to be made should be taken from the lode at the ends or face of the drifts, becks or crop-pings, by an experienced, practical miner in a quantity of not less than 13 cubic feet, and should be of as true an average of the rock in sight as can possibly be obtained. The broken 13 cubic feet should then be conveyed to the place selected for making the test, and with spalling hammers broken to the size of macadam stuff, of which, after a thorough mixing, two hundred weight, representing as nearly as possible an average of the whole, should be taken and placed on a piece of canvas about two yards square, in the center of which is a stamp die, and then, with cobbing hammers, the two hundred weight should be reduced small enough to pass through a two-inch riddle; the die is then removed and the canvas raised from each side, so that the broken quartz be well mixed, from which two samples of four pounds each can then be taken. A "heavy bucking hammer," with a large-sized "bucking iron," on a piece of canvas so spread or placed that it will collect what flies or is thrown from under the bucking hammer, will reduce the macadam stuff much more rapidly, and is perhaps better than cobbing. (A bucking hammer is formed of a piece of iron six inches square and one inch thick, adapted to a wooden handle.) The cobbed four pounds samples should then be passed through Taylor's hand rock-crusher till it is fine enough to go through a sieve with 30 holes to the linear inch, or even finer, if considered advisable. The following is a description of Taylor's crusher:

The design of this small machine is to enable a person quickly and easily to bring to fine powder the hardest ores to be assayed or sampled or worked. Both jaws are faced with hard white iron, the lower parts of which are plain surfaces, between which the ore is crushed fine. The stationary jaw *B* has its lower plain surface at an angle to the upper or corrugated surface. Lower part of this jaw is adjusted by screws to crush fine or coarse. The movable jaw *C* is operated by the hand-lever *A*. Jaws, links and toggles as shown in Fig. 2. The jaw *C* has its corrugations horizontal to facilitate forcing the ore down at each stroke of the lever. This jaw has a vertical and horizontal motion, the link *E* forcing plain part of jaw *C* forward with great force at each downward stroke.

The whole can be quickly taken apart for cleaning, after each lot is worked, by simply lifting up the lever and throwing it out as in Fig. 2 of the drawing. This crusher is much improved by putting a hard iron plate *E* each side of the jaws to prevent the escape of fine ore, and by making the side straps, *D*, of malleable iron, so they will not break or pull apart as the great leverage has done to cast iron.

The lever has a rubber covering where grasped by the hand, and a rubber cushion where it strikes the bed-piece, to prevent jar and noise.

Each machine has a cover (not shown) to prevent pieces of ore from flying out, and is furnished with a wrench and dust-brush. Extra jaws and other parts can be had. Weight complete, 35 pounds.

Taylor's hand crusher has many advantages over the common mortar and pestle; first the rapidity with which it will crush the quartz to the desired fineness without the stamping and grinding action of the mortar and pestle, by which action so large a proportion of the gold is laminated and floats away when attempts are made to obtain the gold by mechanical assay-washing.

Those conversant with mining and milling know that there are three modes of reducing gold quartz, copper, silver, lead and other ores, namely "crushing," "stamping" and "grinding." The first is effected by horizontal roller rock-breakers, the second by stamps, and the third by edge mills, pans, arastras and mill-stones.

The great objections to the two latter modes of reduction in the treatment of gold quartz

are the lamination of the gold, and the production, when silver, copper, lead and other ores are so reduced, of so large a quantity of slime.

The ore in the condition of slimes, like those from the Comstock mills, is generally in such a state that, so far as I know, all attempts up to this time to profitably recover the metal have failed.

The various simple appliances employed for panning out gold, and the separation of it from pyritic matter and earthy materials, are as follows:

First—"The flat shovel," the use of which is by Cornish ore-dressers termed "vanning." The foremen of the different dressing-floors where copper, lead and tin ores are assayed and concentrated for market, necessarily "van" with considerable skill. Vanning is occasionally brought into use in testing for gold. Some of the Cornish and Swansea assayers years ago were perhaps wrongfully accused of "shovel trying," as it was called, instead of making a fire assay of the samples of copper ore sent to them.

Second—"The pan," as used by placer miners and prospectors. It is made out of one piece of sheet iron, and for washing gravel and cleaning up in milling it is vastly superior to any other utensil. A small riddle (picking riddle), similar to those used in sorting lead and other ores, would greatly assist the operation in washing small quantities of gravel. The earthy matter would be more easily removed or cleansed than by rubbing the gravel between the hands. The picking riddle, with about eight holes to the linear inch, has two long handles fixed to it to work it. A large tub, partly filled with water, is required. The riddle, with the gravel in it to be washed, is then immersed in the water, and by a sharp, quick, half-rotary motion the clay or soil is soon removed from the pebbles or gravel. What will not pass through the riddle is then emptied on a table or board so that it can be examined to see if there are any nuggets or cement that require crushing.

In estimating the value of "drifting gravel," it is best to do so by the cubic foot, and in the absence of sluices, to use the picking riddle and then to wash out the gold with a pan. "In place," the average small gravel will weigh 18 cubic feet to the ton; on the dump, 27 cubic feet.

Third—"The horn spoon," used principally, I believe, by Mexican miners and millmen, to test the mercury in the different stages of the "Patio" and other amalgamation processes. Many of our California experts use it in prospecting for gold. It is made of various shapes and sizes, but all of them too small to treat a quantity of pulp sufficient for a washing test for gold, besides which the grease from the finger-ends in stirring up the pulp in the spoon causes a large proportion of the scale gold to float away on the water, particularly that form of gold generally met with in the cellular portions of the quartz and mostly associated with ferruginous matter. To prove how easily the gold attaches itself to the grease, take some sea-beach gold, put into the horn spoon and rub it with the ends of your fingers, then add water to it, and you will find the greater part of it will float away. Nevertheless, with the horn spoon the presence of gold may be detected, but I cannot recommend it for a mechanical or washing assay, the results not being reliable—in fact, mere guesswork.

Fourth—"The batea," a wooden bowl or vessel used for washing gold by the Mexican and Brazilian miners, and though these two implements differ very much in size and shape, in skillful hands very good results are obtained from both. My improved form of Brazilian batea, a description of which will be found in your report for 1884, is the result for many years of study. My first attempts were made of zinc, one of which I presented to the Jernyn Street School of Mines, London, in 1851, a cut of which will be found in "Philips' Metallurgy," 1859.

The pattern of my latest improved form I have given to John Taylor & Co. and Mr. Justinian Caire of this city, who are making them in good form and of suitable wood. The improved batea, if skillfully handled, will give very accurate results, showing nearly every particle of the mechanically combined gold in the vein-stone. It is also very useful as a concentrator to find the percentage of pyritic matter in the ore.

When the miner is desirous of making a very accurate working test, two bateas should be used, so that the tailings from the first operation can be washed over again. The right-hand fingers should also be covered with rubber coats, so that the grease from them may not float the gold; a little washing ammonia should also be added from time to time during the washing or panning out.

In case there is any talcose or greasy matter in the samples of vein-stone, it should be soaked in boiling water with a little caustic soda for 10 or 15 minutes before panning out, which can be done in a large glue-pot.

When the gold and pyritic matter are brought together in the center of the batea, and well freed from the gangue, allow them to be covered with one or two inches of water, and then with a "bar magnet" remove all magnetic iron, which can be easily effected, but care must be taken at the same time that none of the gold is picked up with the iron; by striking the magnet slightly against the side of the washing-tub, the iron will fall from the magnet.

(Continued on page 287.)

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alameda.

CHROME.—Livermore *Herald*, April 17: There is to be a marked activity in the chrome industry in this district this summer. Work has been resumed at both of the Cedar Mountain mines, and the mineral will soon be coming into town again as rapidly as ever. Messrs. Pitcher & Knight are prepared to buy ore in any quantities, at good prices. Considerable ore is out at the Douglas mine, and work is in progress at the Ab Mendenhall mine. This industry, when actively prosecuted, puts considerable ready money in circulation in our town.

THE EUREKA COAL MINE.—Livermore *Herald*, April 17: The history of the present work of development on the Livermore and Corral Hollow coal mining districts begins with the failure of Wm. T. Coleman, which threw his coal lands on the market. These lands, extending as they do over the Livermore, Eureka and Summit veins—the three great coal veins of this district—with a frontage on Corral Hollow creek, 400 feet below the workings of the Livermore mine, held the key to the situation. Coal could be taken out without hoisting, while at points a level tunnel would have above it nearly 700 feet of coal. Gutmman and others of the Livermore Co. saw this and secured a bond on the land. They then cleared out the old O'Brien tunnels, so as to show the coal veins, and entered into negotiations with Eastern capitalists to sell the property. A coal expert was sent on by these parties, and his report was the most intelligent statement regarding the district ever made. On the strength of this report, John Treadwell, of Alaska mining fame, bonded the property and agreed to thoroughly develop it. He is now running a tunnel in a northerly direction from the O'Brien place in Corral Hollow creek, to tap all the known coal veins and whatever else it may encounter. This tunnel, to reach the Summit vein, must be 3000 feet in length. It is 9x10 in size, and has been driven into the mountain 1400 feet. In places it is timbered, 12x14 timbers being used, and put together in such a way as to secure great strength. There are long stretches, however, where the rock is firm sandstone, which stands without timbering. At 450 feet about a foot of coal was encountered. At 500 feet the Livermore vein was passed through—five feet of good coal. Then followed numerous small veins of from two inches to two feet, and at 1100 feet the mammoth Eureka vein was struck. This is fully 16 feet wide, with 12 feet of solid coal. From this point the tunnel is but 6x7 in size, and needs no timbering. It is being pushed forward by two shifts at the rate of 10 feet every 24 hours. The rock is not hard, and it contains very little water. Preparations are now in progress to run lateral tunnels along both the Livermore and Eureka veins. These three tunnels will be pushed with energy, and an additional force of men will be put on in a few days. They will be run alongside the veins to a distance of about 1500 feet on each. This will thoroughly test the value of the mine. It seems to be the intention of Mr. Treadwell to thoroughly ascertain the value of his mining property before taking out any coal or building a railroad to it. He has, however, become sufficiently convinced of its worth to warrant him in securing the title to it, which he did this week. There were three groups of interests—those of the assignees of Coleman, those of the secured English creditors, and those of the Eureka Coal Mining Co. The total sum paid was \$50,000. Mr. Treadwell had previously purchased the property of the Livermore Coal M. Co., and has secured title. This gives him more than two miles in length on all three of these veins. All have been thoroughly prospected at the west end, and the great tunnel has opened up two of them at the east. These veins extend in very nearly an easterly and westerly direction, a trifle south of east and north of west.

THE EUREKA CAMP is now quite a lively place. About 25 men are employed at the mine on both shifts at present, and this number will be largely increased when work is begun on the lateral drifts. Only the best miners are employed, and every portion of the work shows that fact. A new superintendent, J. J. Kermin, took charge of the mine this week.

Amador.

PLYMOUTH CON. MINE.—*Ledger*, April 14: In the tunnel on No. 2 (Indiana) they are running two crosscuts. One is in 39 feet and one 18 feet.

AMADOR GOLD MINE.—Mr. Harrison, the manager of this property, returned from San Francisco on Monday evening. In relation to the attachment suits, he informs us that they were instituted by Rankin, Brayton & Co., foundrymen of San Francisco, and that the company disputes the claim. There is no doubt, however, that the matter will be satisfactorily adjusted before long, without involving tedious litigation. At any rate, it is not likely to interfere with the starting of the mill. The sum of \$10,000 was received Monday and the wages of employees all liquidated up to April 1. It is expected that the mill will be ready to commence operations about the 1st of May. J. Irving, formerly of the Kennedy mill, has been engaged as mill-man. About 30 men have been engaged for underground work, and they will commence operations next week. The controversy concerning the right of way for the tramway was finally adjusted Thursday. The necessary papers giving the company the right of way on the present line have been signed and the same placed in escrow pending the arrival of the purchase-money from London. We understand the Morley M. Co., that operated the Weitzel mine in Hunt's gulch for a few months, is about to close out its interests and retire from the mining field in this country.

Calaveras.

IMPORTANT STRIKES.—Calaveras *Prospect*, April 19: It is reported that Frank Cuneo, of San Antonio Camp, has made a valuable find in his mine on Indian Creek Ridge. The vein is from three to four feet wide, and is very rich. It is claimed by Mr. Cuneo that this vein is a continuation of the famous Esmeralda Lead, owned by E. A. Davis and F. J. Martin. Farther up the same ridge, another valuable discovery has been made by L. R. Kline. He has uncovered a vein which has been prospected for years on account of the rich "float"

continually found in the neighborhood, but in vain, until recently discovered by Mr. Kline. The vein can be traced for a long distance, and for over 1000 feet shows a good strong vein of first-class ore, containing visible gold in many places. The walls and gouge show a true fissure formation, and the quartz is dark blue in color. This is undoubtedly one of the most important discoveries made for some time in this region, and we should like to see the property opened up in the proper way. Still farther up the Cunniffe and Driver mines are located. These mines were visited recently by representatives of Eastern capital with a view to purchasing, and it is not unlikely that a transfer may be made in the near future. All these properties are situated on the Indian Creek Ridge—which comprises the Indian Creek mining district, and it has sometimes been called the Bonanza Ridge—commencing with the old Calaveras mine on the extreme eastern limit, and ending with the Esmeralda group of mines on the west. Work has been resumed on the Jesus Lopez mine. A tunnel is to be run directly on the vein, and connection made with the shaft at a depth of about 200 feet.

RICH PROSPECT.—It is reported that at the Union Shaft gravel mine on Central Hill, one day last week, from 4 pans of dirt 4 ounces of gold was obtained. This is a splendid showing, and if correct would warrant the idea that the mine is a bonanza.

THE UTICA MINE.—There are no new developments in the Utica mine relative to the recovery of the bodies buried there. Two have been in sight for some time, but cannot yet be extricated.

Inyo.

THE WHALE.—*Inyo Independent*, April 18: Such is the appropriate name for a mining claim in Saline valley, located by J. White Smith, Ambrose Smith, J. Welsh, and Arlie Mairs. The claim is located near the base of Ubaheba peaks, about 11 miles east of the works of Conn & Trudo. The ledge is 40 feet wide on the surface and this large mass of ore lies exposed for a comparatively long distance. The vein has three separate streaks, differing from each other in color and general character. A ton of ore was gathered, one-third of it taken from each of the streaks, and all of it as nearly as possible of average quality with the whole ledge. The ore was shipped to San Francisco, worked, and yielded as follows: Gold, \$34 per ton; silver, \$6; copper, 13½ per cent. The presumption is that all the gold was obtained in the ore from one of the streaks; and if this be true, the ore of that streak contains gold to the amount of \$102 per ton. It is certain that nearly all the silver was contained in another of the streaks, while copper is more or less diffused through the whole mass, but chiefly in the third streak. From this third streak tons of ore can be taken out that will carry 40 per cent copper and even more. The locators of this immense ledge are making arrangements for its development. The work done by Conn & Trudo in developing the borax deposits of Saline Valley, making a good road and otherwise drawing attention to that region, has led to a closer examination of the country for other minerals.

Mariposa.

WHITLOCK'S.—*News*, April 19: Heisser & Perego made another cleanup at the little prospecting mill on Whitlock's last Saturday, after crushing six tons of quartz which they had set aside as refuse ore, intending to work it when they might have better milling facilities. The result was much better than they had anticipated, the ore yielding 5 ounces and \$4, or \$89 at \$17 an ounce, or a fraction less than \$15 a ton. Some piratical thieves made a descent on the ground-slucers of Jake Teats and old John Geary about two weeks ago, and raked in nearly all the amalgam. No clue has yet been obtained to the identity of the scoundrels. It is pretty rough, after working all winter in all sorts of weather, to have the proceeds of their labor jayhawked in that style. Both men are old pioneer miners, well advanced in years. Geary is nearly 70 years of age, has a family and is a cripple. Ellingham & Grove have the foundation for their new mill ready for the mortar beds. The machinery is being hauled to the millsite.

Nevada.

OMAHA.—*Tidings*, April 19: The Omaha is employing over 100 men on day's pay, and this week the hoisting plant on the Lone Star shaft will be started. Notwithstanding the heavy drafts on the company's treasury for dead-work and improvements, a very respectable surplus is on hand. The cave in the Homeward Bound shaft is a mean one to handle, and there is much water to contend with. The Hartley has a full force of men at work and the mill is running on company ore. The air tunnel has not yet been completed, "blowers" supplying air in the meantime. The Pittsburg is practically clear of water and the new ore cut recently is holding out most encouragingly.

MENLO MINE.—*Union*, April 18: The shaft of the Menlo mine is being retimbered near the surface, as the old timbers have been found decayed. There has been a cave in the shaft 60 feet from the surface which will take a short time to get through, and then there will be no further impediment to clearing the shaft to its full depth, 250 feet.

A BIG PUMP.—A 16-inch plunger pump for the North Star M. Co. has just been cast at Nevada City. The castings are of superior quality. In all, the pump and connections will weigh about seven tons. It will be several months before the pump and connections will be ready for delivery.

CONTRACTS.—*Grass Valley Union*, April 17: Contracts have been made for the machinery and lumber for the pumping and hoisting works of the Ben Franklin mine, and the lumber is to be hauled to the mine immediately. The machinery purchased is the same that was formerly used in the El Capitán mine, at Town Talk. Contracts have also been made for the lumber for the new works to be erected at the St. John mine, and the hauling of the same is about to be commenced.

ORE SHIPMENTS.—*Eureka Sentinel*, April 19: Thirty E. & P. carloads of ore left the railroad depot in transit to Salt Lake during the week. We learn that as soon as the New York Caoyon road is opened, hauling from the Diamond, Lord Byron and other mines in that locality will be resumed.

Placer.

SHADY RUN.—*Cor. Placer Republican*, April 16: The Blue Bluff mine has been worked for several years by the Wedgewood Bros. It has been both a hydraulic and drift mine. A few years ago it yielded a vast amount of gold in large nuggets,

but it has always been very spotted. Adjoining this is the North America. This also paid well in years gone by. H. K. Devey, one of the shareholders of the famous Hidden Treasure at Sunny South, was the last to work this mine, which has always been drifted; but Mr. Devey is confident that it would pay well to be hydraulic. The Haub joins the North America. Conrad Haub is the owner of this mine. Several tunnels have been run to work it, but all too high. A few years ago Mr. Haub started a tunnel, lower than the rest, which he has been driving ahead from time to time as his means would permit. He expects the tunnel will be about 1000 feet in length when completed. The next mine is the Elite Con. Here a tunnel has been run through a cement formation 1100 feet, where a shaft was sunk to the depth of 158 feet, through a number of different strata, some of which were cement, sand, pipe-clay, lignite and gravel to the bedrock; but it was not far enough in, as the bedrock was pitching into the ridge. This work was all done by hand-power, and as the water came in so fast the shaft was abandoned, and now the company propose to sink an incline and use the same kind of power as is used at Towle Bros.' pulp-mill to hoist the pulp to the level of the railroad-track; that is, they will construct a tramway in the canyon at the mouth of the tunnel where a car filled with water will bring up the carload of dirt from the bottom of the incline at the back of the tunnel. This is the only attempt that has been made to develop the channel which is supposed to lie under the lava ridge between Canyon creek and Blue Canyon. Mr. Harvey's mine has been worked with the hydraulic process. When that was stopped, Mr. Harvey began to get it in shape to drift and was getting very favorable prospects, but was compelled to give up work on account of ill health. Unless all indications fail, this mine will be worked with good results. About the latter part of October last, Mr. Hoover of Alta began the construction of a large flume, to carry water from Blue Canyon to what is known as the Fannon mine, situated on the hillside several hundred feet above the bed of the canyon. Mr. Hoover expects to be taking out pay soon. S. Jordan of Dutch Flat has purchased the Hovey quartz mine in Blue Canyon, and will commence operations soon.

San Diego.

STONEWALL.—*Julian Sentinel*, April 18: Waldo Waterman was in town yesterday. He says the new machinery of the Stonewall is working nicely, crushing about 75 tons of ore per day. He informed us it is their intention to prospect several new ledges on the grant this summer. The contract for sinking a shaft on one has already been let, and the work commenced to-day.

Shasta.

REDUCTION WORKS DESTROYED.—*Redding Free Press*, April 16: The Redding Reduction Works were totally destroyed by fire Wednesday night. The works were owned by Billy Conant. W. H. Fowler, the mining expert, estimates the loss of machinery at about \$13,000. Mr. Fowler took charge of the plant several weeks ago, and since has expended not less than \$1000 in repairs and additions. Everything was complete to the smallest detail, and it was the intention to start up full blast next Monday. The works were insured for \$3500. The most possible theory is that the building was deliberately set fire by an incendiary.

NUCKET.—There is on exhibition at the Bank of Shasta county a \$500 quartz gold nugget. It was brought to town last Monday by parties who are not prepared to have their names published at present. It is said that the same parties have another nugget in their possession that weighs 17 ounces. If they have a ledge of the same sort of stuff it is the richest mine on earth. There will be a rush of prospectors to the spot when the location of the find is made known.

NEW COMPANIES.—Four new companies are operating in the mines of Shasta county this year—the Chicago Co. at Muletown, one at Whiskeytown, one on Grizzly gulch and another in the Old Diggings district.

CALUMET.—Dr. Garlich of the Calumet mine has returned from Ohio. Also A. B. Paul from S. F. Work on the mill and mine will be resumed. The Spring creek ditch will be repaired, new flume erected, and general repairs made from the ravages of winter.

DRY PROCESS.—Four gentlemen from Chicago are putting in a patent dry process sulphurets-working plant at Middle Creek station. It is said they have made a success of their patent process in the Rocky mountain mining fields, and concluded, after a survey of the field, that Shasta county was the most promising district on the coast in which for them to operate. Their machinery has been shipped from the East.

WHISKYTOWN.—*Cor. Shasta Courier*, April 19: The new camp being opened up here is located on the divide between Spring and Whisky creeks, south of Iron Mountain. There has been a number of locations made, and for the amount of work done, shows as well as anything in the county. The Iber Bros. are sinking a shaft on an 8-foot ledge. They are down 50 feet, and it prospects well from top to bottom, and carries heavy clay gouge. It shows for a great mine. Meed & Williams are sinking on another large ledge and are down 40 feet in good ore all the way, and it shows fine. Small & Lyman have two locations. They are prospecting, and have on one ledge a pay chute they have crosscut on the surface in several places a distance of 900 feet. In no place does it carry less than 55 per ton in free gold, and from that into the hundreds, and has an average width of three feet. This is the best showing for the amount of work done I have ever seen in the county. This is a good field and will no doubt prove one of the noted mining camps of the county.

IRON MOUNTAIN.—Col. Magee and Charles Camden went up to Iron Mountain this week on a visit of inspection to the mine and works there. A force of laborers has been at work for some time putting everything in order that was demoralized by the winter storms, and the mill will be put in operation next week.

Sonoma.

COAL INDICATIONS.—*Santa Rosa Republican*, April 16: T. J. Brown of Bennett Valley brought to town this morning some fine specimens of lignite found in Bennett Valley creek on the place of A. Benjamin. The specimen found in the creek is a pine log 12 feet long and 4 feet in thickness, almost

a pure lignite and strongly impregnated with gas. The supposition is that it is afloat from the Sonoma mountains on the north side, where a large body of pine timber is located, and is a continuation of the coal vein that has cropped out on the west side of the mountain on the lands of Thos. Hopper and F. Lacque.

NEVADA.

Washoe District.

OVERMAN.—*Virginia Enterprise*, April 19: The stopes on the 1200 level are yielding about 200 tons of ore a week. This averages about \$18 a ton. A fair proportion of prospecting is being done.

JUSTICE.—The north drift, 622 level, is passing into quartz that carries some metal. The mine is yielding about 200 tons of ore a week, the average assay of which is over \$26.

SEG. BELCHER.—All prospecting work going on as usual.

CHOLLAR.—The east crosscut, 80 feet south of north line, 750 level, is out 216 feet; face in porphyry. The east crosscut, 80 feet south of north line, 850 level, is out 125 feet; face in porphyry.

POTOSI.—The east crosscut, 300 feet south of north line, 850 level, is out 196 feet; face in porphyry with streaks of quartz which give good assays. East crosscut 400 feet south of north line 850 level is out 178 feet; face in porphyry. The winze below the 930 level is down 52 feet; the bottom is showing stringers of ore of good grade. The raise above the 930 level is up 99 feet; the roof is in quartz giving assays of from \$20 to \$45 a ton.

CON. IMPERIAL.—No. 1 crosscut on the 500 level is advancing in a promising formation, which consists mainly of porphyry and quartz.

CROWN POINT.—Work on the old west crosscut on the 500 level is making good progress. The 300 winze is down 22 feet. The bottom is in good ore. The north drift from the 350 level stoop to connect with it is completed. Shipped to the mill during the week over 750 tons of ore, the average battery samples of which will be about the same as last week.

SAVAGE.—On the 300 level the south and north lateral drifts are advanced respectively 169 and 94 feet. Are extracting ore from the 400, 500, 600 and 750 levels, and are running prospecting drifts on each of these levels. During the week have milled over 450 tons of ore of the average value, as per battery samples, of about \$22 per ton.

BELCHER.—The 200 south drift from the west crosscut is out 190 feet, having been extended 15 feet during the week. The face is in low-grade quartz. The 300 west crosscut is out 72 feet. The face is all in quartz showing spots of pay ore. The 600 south lateral drift is out 232 feet, having been advanced 15 feet since last report. The 800 joint crosscut is out 333 feet, and the face is in hard porphyry.

ALPHA.—On the 500 level the west crosscut continues in hard porphyry. On the 600 level the south lateral drift is still in soft porphyry that carries many stringers of quartz.

ENCHOUER.—On the 500 level the east crosscut is still advancing in porphyry. On the 600 level the north lateral drift is in a favorable mixture of quartz and porphyry.

HALE & NORCROSS.—About the usual amount of ore is being extracted from the ore-producing sections, the average assay of which is about \$20 a ton. A good deal of prospecting work is being done on the 500 level. The repair work and re-timbering of old drifts required to be reopened will soon be completed.

NEW YORK CON.—The exploration work in this mine is being prosecuted on the 650, 800 and 950 levels. On the last-mentioned level the south drift is passing into quartz that yields promising assays. The formation on the levels above is soft and favorable.

WARD COMBINATION SHAFT.—On the 1800 level the east drift is being steadily advanced in a porphyry formation.

SCORPION.—The southwest drift on the 630 level continues in porphyry.

UTAH.—Good headway is making in the work of cutting out a station on the northwest side of the shaft station at the 725 level.

BEST & BELCHER.—On the 1000 level, east crosscut No. 1 has been extended 15 feet; total length, 342 feet. Formation, hard porphyry. On the 1200 level the north drift has been cleaned out and repaired 28 feet; total distance, 578 feet.

GOULD & CURRY.—On the 200 level west crosscut No. 2 has been extended 16 feet; total length, 150 feet. Formation, hard porphyry. On the 400 level west crosscut No. 2 has been extended 25 feet; total length, 585 feet. Formation, soft porphyry.

CON. CAL. & VIRGINIA.—About the usual quantity of ore is being taken from the 1300, 1435, 1500 and 1600 levels. No. 3 crosscut on the 1435 level is in a mixture of quartz and porphyry giving low assays. On the 1650 the south drift from the main west drift from the C. & C. shaft is in good ore. Good ore is also being stoped from No. 8 raise on the 1650 level. The usual shipments are being made to the river mills, and the average of the battery assays will be about the same as last week.

ANDES.—During the past week drift on the 420 level advanced 80 feet. Formation, porphyry and clay with stringers of quartz. Repairs on 350 level will soon be completed.

OCCIDENTAL CON.—The mine is looking very well, and ore is regularly extracted from all the stopes on the 400 and 450 levels. The crosscut on the 550 level continues in soft porphyry and clay. A south drift on this level is developing a considerable amount of low-grade ore. The south drift from the north line on the 450 level is still yielding high-grade ore.

SIERRA NEVADA.—The southwest drift on the 630 level is still in a porphyry formation.

UNION CON.—No. 1 east crosscut on the 1465 level continues in hard porphyry.

MEXICAN.—The crosscuts on the 1465 level are in a porphyry formation that shows some small stringers of quartz.

OPHIR.—In following the ore streaks found on the 1300 level some good milling ore has been encountered. The mine is now yielding nearly 200 tons a week.

CONFIDENCE AND CHALLENGE CON.—All prospecting work making favorable progress, and in places some low-grade ore has been met with.

ALTA.—Work is progressing on the 825, 925 and

1040 levels. The prospecting drifts are nearly all being advanced in favorable material, and in one or two low-grade ore is being developed. The mill is kept running steadily to its full capacity of 45 tons a day. The average value of the ore worked remains about \$20.

YELLOW JACKET.—The ore-producing sections continue to look well, and prospecting work is kept up. The ore shipments average about 65 tons a day.

SILVER HILL.—Exploring work is in progress on the 160, 260 and 400 levels. The prospecting drifts are in a favorable formation of clay and porphyry. In this soft material ore is liable to form.

Columbus District.

MT. DIABLO.—Inyo Register, April 19: The Mt. Diablo at Candelaria is working 30 tons and upward of ore per pay in the 10-stamp mill at Soda. For a time it is claimed the mill has worked 35 tons daily. About 60 or 70 men are at work in the mine. The Belleville mills are not being refitted; on the contrary the upper mill is being dismantled, and many of its timbers will be put into the Holmes. The lower mill may in future be called into service again, but certainly will not be very soon.

Flowers District.

LEAD ORE FOR SMELTERS.—Virginia Enterprise, April 18: There are thousands on thousands of tons of lead ore in the old North Bonanza mine in Flowers district. It is that mine may be found veins of solid metal 20 to 30 feet thick. The galena contains a small amount of the precious metals, almost enough to pay for working. It would seem that it would be just what is wanted for mixing with dry ores, but we here do not pretend to know much about smelting. The mine has for years lain idle. We are of the opinion that it would pay some of the furnace men of Salt Lake to take a look at this bonanza of galena.

Tucacora District.

NEVADA QUEEN.—Times-Review, April 18: North gangway from 600-foot level of North Belle Isle has been advanced 21 feet.

NORTH BELLE ISLE.—The concentrator will be started as soon as feed can be got in to run the teams. The stops above the 300 continue to look about the same.

NAVAGO.—The east crosscut from the end of the south, 150-foot level, extended eight feet and suspended, and work resumed in the opposite crosscut.

BELLE ISLE.—North drift from the crosscut near the Navajo line, 250-foot level, extended five feet; face is all in vein showing some low-grade ore. South drift from the crosscut from the 350-foot level, extended eight feet; the vein is strong and shows some good ore.

GRAND PRIZE.—500-foot level—West drift from north crosscut extended seven feet; east drift on north vein extended 21 feet, and west drift 20 feet. Faces of both drifts show a strong vein, with streaks of ore through it. On the 400-foot level have started an east drift on north vein to explore the upward continuation of this ore from the 500-foot level.

DEL MONTE.—First level—North gangway has been extended 15 feet and No. 3 crosscut started east in the vein. North drift from joint crosscut advanced 12 feet, seams of ore in the face.

NORTH COMMONWEALTH.—First level—No. 2 east crosscut extended 16 feet, in vein formation. East drift from top of raise is in 16 feet; 2 feet of ore.

COMMONWEALTH.—Fourth level—East crosscut from north gangway extended 14 feet, cutting into a vein of quartz four feet, assaying from \$2 to \$8 per ton. Upraise from south gangway up 19 feet; does not show so well as last reported. Concentrator running regularly; crushed during the week 530 tons, \$16.45 per ton.

ARIZONA.

BRADSHAW MOUNTAINS.—Journal-Miner, April 14: S. J. Hodgdon left to-day for the Bradshaw mountains, to work on the Roanoke, Alice and Pearl claims. F. G. Goodwin brought in a bottle of gold-dust to-day which he bought from placer miners along the Hassayampa. A. J. Rubert came in from Skull valley last evening, where he is engaged in putting up his Huntington mill. He expects to be able to start up soon. Frank Fentoo has recently discovered a ledge near Goodwin's station at Willow creek, from which he has had assays in silver of from \$500 to \$600 per ton. W. H. Harlan, of the Howard mine, brought in a 52-ounce bar of gold yesterday, which he shipped to the mint at S. F. The mill is running successfully. The Trinidad & Castle Creek Co. has executed a deed of trust to H. J. Alexander for all the mines owned by the company in Yavapai county, for \$11,612.10. The Del Pasco mill has been thoroughly overhauled and repaired, and will start up in a few days for the summer, there being plenty of ore and water to keep it in operation without stopping. The Mockingbird mill has been closed temporarily, on account of not being able to get the ore packed in rapidly enough to keep the mill in operation. A wagon-road will be built and freight teams employed to transport the ore. Sheriff O'Neill yesterday received a letter from his deputy, J. L. Black, of Flagstaff, saying that another party had just returned from the Grand Canyon with specimens of mineral that were richer than anything previously discovered. The excitement continues greater than ever.

STOCKTON HILL.—Cor. Mohave Times, April 19: In this, and the camps immediately surrounding, mining matters are in an active state and a great many miners are employed, while a good many chlorides report prosperity. At the Night Hawk is employed a larger force than ever before, and this famous producer of rich ore is holding its reputation at the front.

THE BIG BETHEL.—The Mulligans, Tom and Jim, have a veritable bonanza in this claim, situated on the divide between Todd and Union Basins. The ledge is more than 40 feet in width, and will average \$20 per ton across the face, while the tunnel is driven to the hanging-wall and is carrying an 18 to 24 inch streak of sulphurets which, on assaying, will average about 200 ounces silver per ton.

DAKOTA.

RICH ORE.—Deadwood Pioneer, April 18: A strike of exceptionally good fire milling ore was made in the Big Missouri just before shifts changed Saturday night. The day shift broke through the

wall and uncovered rock that fairly glistens with free gold.

FLOAT.—The Golden Reward Mining Co. is working three shifts in its Bald Mountain mines. The property looks exceedingly well.

COLORADO.

LEADVILLE.—Herald-Democrat, April 17: Operations on the southwest side of Carbonate Hill are beginning to extend themselves to a much greater extent than has been the case for a long time. Practically these mines have been shut down for a number of years, but on many of them a considerable amount of work has been projected for the spring opening, and in several instances work has already commenced, notably on the Elina, Carbonate, and Yankee Doodle. The new strike on the former made by Mr. Thompson, at a comparatively shallow depth, is looking much better to-day than when first struck. At the time of our visit some very excellent chloride ore was being hoisted, and a small lot of much better looking dry silicious ore carrying sulphurets was in the bins. At present the pay streak is in the neighborhood of two feet in thickness, though in the northeast drift it seems to be widening. On the Carbonate, just across the line, the Thrall partners will, in all probability, have to sink their shaft deeper in order to fully develop that ground, as the dip is considerable in that direction. On the Yankee Doodle incline some of the men who formerly worked there are doing fairly well, working under tribute to the company, and are now engaged in cutting out the road in order to resume shipments from that point. Some little prospecting is also going on in the old Shamrock incline, though with but little encouragement so far.

LOWER CALIFORNIA.

NUGGETS AND DUST.—San Diegoan, April 16: More nuggets and gold-dust from the Alamo mining district came in this morning by the steam-r from Ensenada. Some of the precious metal as usual found its way to the banks. The First National bought bars worth \$500 and about \$300 worth of loose gold. The California National Bank bought some 15 ounces.

MONTANA.

THE SOUTHERN CROSS.—Anaconda Review, April 17: This mine, as at present developed, shows an immense body of ore of fair grade. The operation of the Cameron mill, however, has not proved quite satisfactory, and the company proposes to erect a large mill near the mine.

CHAMPION.—As the result of its first nine-days' run, the Champion mill has exhibited in Deer Lodge two silver bricks estimated at \$26,000 in value. The ore worked was of low grade and better results are now looked for from the higher grade ore.

THE SILVER CROWN.—In this mine a strike of rich ore is reported. Assays give 134 ounces of silver and \$5 in gold per ton. This mine, with its neighbors, the Champion and the Ruby, promises to give the new town of Champion an enviable reputation.

WILLOW SPRINGS.—Several tons of ore from the Lula mine in Willow Springs district, Jefferson county, have been received at the sampling works in this city for trial. The Ida mine, in the same district, has made a shipment of ore to the Helena smelter for treatment, and other shipments will follow from this property. In the latter mine there is reported to be at the present time not less than \$10,000 worth of ore in sight, and the Ida gives every indication of proving a large and regular ore-producer. Located high up in the Little Belt mountains, near the base of Yogo Baldy, is a large copper-gold bearing lode which is liable to astonish the natives when it is opened up, the working of which will be commenced shortly by the Nelhart company, which owns this and several other mines located in Yogo, Nelhart and Barker districts. The ledge in question is said to be perfectly defined and shows about 60 feet of ore on the surface, assays from which show as high as 65 per cent copper and \$12 in gold. A tunnel will be run to tap the vein at a depth of 250 feet.

IDAHO.

SALE.—Challis Messenger, April 19: The Silver Creek mine, Bayhorse mining district, has been sold by E. E. Dunphy, Bayhorse, to Geo. Newbauer and Erhart Gramp, of the same place, for the sum of \$100,000.

NEW MEXICO.

ZINC MINES SOLD AND BONDED.—Silver City Sentinel, April 17: On Friday last M. W. Neff sold to John Brockman of the Silver City National Bank, the valuable property known as the Neff zinc mine, located in the Hanover district in this county. The consideration is private, but it is believed to be quite large. On the same day Peter Mangall bonded the Mangall & Black zinc mine, also located in the Hanover district, to the same gentleman. This places Mr. Brockman in the possession of all the developed zinc mines in this county. It is understood that in bonding and purchasing these properties he is acting as the agent of a company of Illinois capitalists, who intend to commence active mining and shipping operations at once.

UTAH.

ANOTHER MINING DEAL.—Eureka Chief, April 18: T. P. Murray, the Salt Lake mining broker, secured a lease and bond Friday on Capt. Hugo Deprezin and Pat Donnelly's group of claims adjoining the big Bullion-Beck, Eureka Hill and Blue Rock mines. The claims consist of the Solid Muldoon, Silver Glance, Ontario, Mary L., Belcher, Deprezin Lode, Comstock, Golden Eagle and the Mary L. Millsite. The lease is for six months. Mr. Murray stated to a Chief reporter that he will commence work on these claims at once, with two shifts of men, night and day. Capt. Deprezin is retained as manager.

PROSPECTING has begun in earnest and the mountains and gulches are full of men with burro and pick in search of good-looking croppings. The number is being augmented every day by newcomers who have but recently heard of the wonderful richness of Tintic mining district.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING APRIL 15, 1890.

- 425,734.—SHEAVE.—W. H. Birch, S. F.
425,733.—ORE FEEDER.—C. B. Bingham, Volcano, Cal.
425,740.—AUTOMATIC FIRE-LIGHTER.—H. W. Borchers, Portland, Or.
425,767.—ELECTRIC RAILWAY.—T. A. Evans, S. F.
425,773.—HOSE COUPLING.—Robt. Franken, Pomona, Cal.
425,776.—PACKING FOR STUFFING-BOXES.—Gatchell & French, Oakland, Cal.
425,423.—BUGGY-SEAT PROTECTOR.—J. O. Hamaker, Bonanza, Or.
425,671.—STUMP-PULLER.—Geo. Harvey, Forestville, Cal.
425,675.—COATING METAL PIPES.—J. D. Hooker, Los Angeles, Cal.
425,887.—BASEBALL GLOVE.—G. C. Kohler, S. F.
425,816.—TRAY FOR DRYING FRUIT.—S. A. Moulton, Campbell, Cal.
425,907.—RAILROAD-TRACK LAYING MACHINE.—Geo. Roberts, Eulenburg, Wash.
425,829.—RAILROAD-TRACK LAYING MACHINE.—Geo. Roberts, Tacoma, Wash.
425,831.—VENTILATING OUTLET FOR REFRIGERATORS.—L. Schaffer, Oakland, Cal.

The following brief list by telegraph, for April 23, will appear more complete on receipt of mail advices:

- Calif. mia.—Rosalie V. Baraco, Fresno, closet attachment, Elwood Chaffey, Santa Monica, wave motor; Leo D. Craig, S. F., ore-feeder; Jessie G. Greenlow, Pepperwood, fruit-picking stand; William W. Hitchcock, Los Angeles, key-faster; also hypodermic syringe; William P. King, Los Angeles, floor-tightener; A. Mayer, Pasadena, two for automatic fluid tanks; Alexander McDonald, Franklin, sack fastener; John A. Paton, San Diego, retaining device for overshoe; Silas F. Woodworth, Clippert day, sheet-metal folding machine.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MARKER, CUTTER AND POLISHER FOR PLASTIC STONE-WORK.—Eliza K. Smith, S. F. No. 425,110. Dated April 8, 1890. This invention relates to a device for marking, cutting and polishing the surface of artificial stone or concrete, and is especially adapted to laying artificial-stone pavements or sidewalks where the central portion of the stone block is required to be roughened, while a smooth and polished surface surrounds this roughened portion, and grooves or channels are marked in this polished portion, which form the separating lines between the blocks of stone, or in some cases simply for ornamentation. It consists of a metal plate having a surface or surfaces corresponding in width to the portion to be polished, and intermediate projecting ridges which serve to form the marks or divisions on the surface of the stone. So great is the advantage of having the implement with two or more projecting ridges and the polishing surfaces between them combined together, that it is claimed a workman will lay fully one-third more pavement (everything else being equal) with such an implement than he can lay with an equal amount of time and labor if he uses implements which contain but one of the projecting ridges for making the depressions and smooth spaces mentioned.

SPRINKLER.—Joseph Oswald, S. F., assignor to Harris, Oswald & Noble. No. 425,340. Dated April 8, 1890. In the manufacture of lawn-sprinklers of that class having a vertical standard and a rotary head with arms, upon one side of which jet-holes are made for the escape of the water, so as to give the sleeve a centrifugal rotary motion, various methods have been employed to provide an easily running head, and at the same time to prevent or compensate for wear which may take place. This improvement in lawn-sprinklers consists essentially of a hollow standard through which water is conveyed, a slightly tapering or inverted conical head fitted to the upper end of said standard, the upper and larger end terminating in a shoulder against which a correspondingly shaped sleeve abuts, said sleeve carrying the arms by which centrifugal rotation is produced, and being held in place by a nut which screws upon the lower part of the head and by which adjustment may be made. By means of this nut the sleeve may be raised or depressed so as to change its fit upon the head. A close joint may always be kept.

PACKING FOR STUFFING BOXES.—W. S. Getobell, San Jose, and Robert E. French, Oakland. No. 425,776. Dated April 15, 1890. This invention relates to that class of packing for stuffing-boxes of all kinds in which contractible metal rings are employed and from which the usual term of "metal packing" is derived. In this invention the rings and parts are compressed between a gland on one side and a spring on the other so that the tighter the gland is set up the greater the compression of the several parts. The contractible rings are compressed between the conical seats in which they fit, and this compression upon their periphery causes them to contract and thereby

bind perfectly upon the working rod. There is no need of any enrolling elastic or compressible material or band to cause the metallic rings to contract on the rod, as their conical seats effect this purpose with absolute accuracy.

REVERSIBLE WINDOW-SASH.—Ernest L. Requin, Sacramento, and Thos. J. Kingston, S. F. No. 425,146. Dated April 8, 1890. This invention relates to that class of window-sashes which are pivoted by their stiles to the casing, whereby they are adapted to be reversed in order to allow the outside of the glass to be reached and cleaned with convenience. The invention consists in the novel construction and arrangement of the sash-frame, the means for turning the sash and locking it in position when turned, the means for tightening it, and other details of construction.

TRAY FOR DRYING FRUIT.—S. A. Monilton, Campbell, Santa Clara Co. Dated April 15, 1890. The points of novelty lie in the hearing pieces and the end pieces which are so arranged that when the trays are piled, free ventilation is provided for the entire tray-pile in all directions. The hearing pieces raise the tray bottoms off the ground so that when the trays are severally taken up to pile them, no dirt or gravel clings to them or falls in the other trays.

SHEAVE.—Wm. H. Birch, S. F., assignor of one-half to Charles J. Kaighin. No. 425,734. Dated April 15, 1890. The object of this invention is to provide a sheave having a separable or detachable easily renewable wearing-surface, whereby the body of the sheave may be preserved indefinitely. Though this improved sheave may be used in any place or connection, it is especially of value in the construction and maintenance of cable roads, being adapted for use in the tension-carriage, at all places where a change in the direction of the rope is bad, at the terminus of the road where the rope returns, and wherever there is particular wear and strain on the cable. In these and similar places the sheaves always wear out on their rims, and they then have to be entirely renewed—a difficult and expensive proceeding—and in the operation of cable roads a delay is caused, the effect of which is to tie up the entire road. This invention avoids this necessity, and also gives other advantages.

ORE FEEDER.—Cullen B. Bingham, Volcano, Amador county. Dated April 15, 1890.

This is a device for feeding ore to quartz-mills or other crushing machinery. The ore flows from a hopper into a horizontally inclined rotating cylinder, and the angle of the cylinder may be changed so as to make it feed fast or slow as desired. At the front of the cylinder is fixed a scraper which extends along in contact with the upper interior and of the scraper so that wet or sticky ore will not clog the machine.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

DIRIGO M. CO., April 5. Location, Nevada. Capital stock, \$1,000,000. Directors—A. V. Oliver, Carl Davis, W. H. Cone, Ed Dexter and S. A. Fisher.

ANTELOPE RANCH CO., April 5. Object, to deal in lands and construct irrigation ditches. Directors—J. F. Turner, H. Oterson, A. J. Robinson, C. P. Rixford, A. J. Sanborn, J. W. Wesson and A. E. Bolton.

PACIFIC ROLL PAPER CO., April 5. Capital stock, \$100,000. Directors—Smith Bartlett, F. W. Ainsworth, T. J. Corwin, Bartholomew Noyes.

CALIFORNIA CAMERA CLUB, April 6. Object, social and educational. Directors—George W. Reed, Clarence J. Wetmore, Sanford Robinson, A. P. Flaglor, Thomas P. Andrews, William N. McCauley, E. J. Molera, E. P. Gray, Thomas C. Norcan, Howard C. Tibbitts and I. E. Thayer.

CALIFORNIA FUEL CO., April 7. Object, to buy, sell and manufacture all kinds of fuel. Directors—C. C. Cashberg, G. H. Swasey, E. K. Taylor, T. J. Janes and C. S. Swasey.

CALAVERAS BIG TREES CO. Object, to operate and sell lands and water rights; also to erect and carry on hotels, stores, livery stables and all other business pertaining to hotel-keeping. Directors—James L. Sperry, William Crocker, James W. Sperry, Evans F. Pillsbury and Frederick J. Huse.

HERCULES G. M. CO., April 8. Location, Meadow Lake, Nevada Co. Capital stock, \$1,500,000. Directors—John P. Clark, Frank J. Cook, J. C. Spellingberg, J. H. Knuthson and John Hayes, all of Sierra City.

CITRUS FRUIT CO., April 9. Location, Placer Co. Capital stock, \$500,000. Directors—Charles S. Wheeler, D. H. Porter, A. G. Freeman, E. K. Baxter and W. C. Stoud.

BLUE LAKES WATER CO., April 9 (Oakland). Capital stock, \$100,000. Object, to bring water from the Blue Lakes, Alpine Co., Cal., to the city of Oakland. Directors—H. D. Bacon, Daniel E. Hayes, V. D. Moody, R. M. Kirkham, F. K. Shattuck, A. T. Hatch, T. G. Phelps of Belmont, Thomas Bell, S. A. Marshall, J. W. Smith and J. S. Emery.

The Colorado River Placer M. Co. has filed a notice of the removal of its principal place of business from the city of Colton, San Bernardino county, to this city.

KLAMATH PACKING AND TRADING CO., April 11. Capital stock, \$100,000. Directors—C. C. Rohlf, F. Gee, Jay Deming, A. F. Johns and John Bamhoff.

BEDBURY BALANCE SLIDE VALVE CO., April 10. Object, to manufacture and sell a balance slide valve. Capital stock, \$1,000,000. Directors—George W. Badbury, H. D. Wallace, Henry H. Clement, E. F. Badgley, Robert Brand, J. C. Brown and W. M. Cannon.

MECHANICAL PROGRESS

Blacksmiths and Their Calling.

Blacksmiths and other iron-workers should be very proud of their calling. Gold has been called the most precious of metals, and so admitted; but as between gold and iron, the world could better dispense with the yellow metal than with iron. Of course we could exist without either; but to be without iron would carry us back centuries and paralyze thousands upon thousands of industries, and take away nearly all the great inventions of modern civilization. This can readily be comprehended when once attention is called to the fact.

The antiquity of iron is an unsettled question, but we have mention of it in the earliest records, and from all times the workers in iron have been held in high esteem, and oftentimes considered chief among the many. The Greeks had their Vulcan and the Hebrews their Tnal Cain. Even in the wilds of Africa, Dr. Livingston discovered workers in iron, and the novel method they had of working it was surprising. The modern forge is an improvement over the bellows, but the latter, of course, should not be mentioned in the same breath with the rude contrivance of the Africans—an earthen forge, covered with two blow-pipes, acting without any tuyeres, but attached to two upright boxes or valves. In these valves the operator places pistons, which he works up and down alternately with either hand, and thus forces a continuous blast. It is a rude but ingenious, and works reasonably well. A stone near by answers the purpose of an anvil. In early times the glory of the iron-worker lay in the fact that he was the maker of swords, spears and other implements of war. War was the principal occupation of people then; might was right, and war to the captives.

Now the scene is changed. The world is peaceful. Agriculture, commerce and the mechanical arts furnish the chief sources of livelihood, and in all these the iron-worker lends a helping hand. The farmer's implements are made by the iron-worker, his horses are shod (occasionally) by the iron-worker; the wheels of commerce are accelerated by his efforts. Without him, it would be the slow ox team of yore, while he almost, if not actually, personifies machinery. Verily, the legend attributing to the iron-worker the seat at the right of King Solomon, at the dedication of the great temple, is but further proof of that wise monarch's wonderful wisdom.—*Blacksmith & Millwright.*

TEMPERED COPPER BOXES AND BEARINGS.—Copper is well known to be the basis of nearly all anti-friction metals. It, however, lacks the strength in its natural state for bearings, and must be hardened by amalgamating with tin and other metals, to give it the required strength and hardness. Such mixtures change the whole nature of the copper, leaving it a granular and brittle metal with a hard grinding surface, instead of a tough, fibrous metal. That copper was hardened or tempered by the ancients no one can doubt, as samples of edged tools and relics of all kinds have been found, composed of pure copper, and are on exhibition in all collections. It is said that the Eureka Tempered Copper Co. of Northeast, Pa., has discovered this process, and is able to supply the trade with any and all kinds of copper cast solid, tempered to any gauge that the work expected of them demands. Among the uses to which tempered copper can be put are: Locomotive and railroad bearings, engine-boxes (high or low speed), gears, pinions, gibs, rolling-mill boxes, mill steps, springs of all kinds, roll plate for boiler plates, all kinds of journal hearings, loose pulleys, friction clutches, carriage axles and boxes, street-car boxes, steam pumps and valves, pump linings, rider brasses, commutator strips or bars, electric brushes, dynamo shells, bearing-boxes for electric motors and dynamos, trolley-wheels, electric switches or contacts.

TESTING CAR AXLES.—The most efficient test of car axles ever made at the United States Rolling Stock Works has recently been completed. Of the axles tested, only one broke, and that was put under a drop of five feet and given 25 blows. The first one tested was given five strokes from the ponderous hammer. Three of these strokes were a deflection of ten feet, and the other two 15 feet. There was no fracture. The second was subjected to seven blows, three of which were 10 feet and four 15 in deflection. There was no deflection. The third stood three blows at 10 feet and 22 blows at 15 feet. It broke under the 25th blow. The fourth stood three 10-foot strokes and five blows at 15 feet without a fracture. The fifth was given three strokes at 10 feet and two at 15 feet without a fracture. The test was made by the inspector of the Savannah, Florida & Western railroad, and the axle was pronounced by him to be the best and strongest he ever passed upon.

COKE AND WHITWASH IN STEEL-MAKING.—The Carbon Iron Works, according to the *Engineering and Mining Journal*, are revolutionizing the trade, in one direction at least. For a year past the company has been making steel by the direct process. Rhode Island graphite was formerly used to absorb the impurities of the iron ore. The graphite was a success, but the freight on it amounted to a considerable

figure, and the company looked around for something with which to replace it. They experimented with coke, and soon found that it would answer all purposes when treated with whitewash. When coke was broken into small pieces and soaked in whitewash, all the impurities of the ore were freed, the oxygen of the iron joined with the carbon of the coke passing off as carbonic acid gas, leaving the impurities in such a shape that they could be easily eliminated. By this means the blast furnaces are doing away with the graphite and a great deal of expense avoided. The coke has now been in use for over a year, and as a result the carbon works are turning out some of the finest bridge plates made in the United States, and steel is produced which is very low in phosphorus.

THE PLATE GLASS BUSINESS appears to have been a rapidly growing industry in this country ever since its first inception but a few years ago, and as is the case with nearly every other branch of mechanical or manufacturing business newly established here and having to compete with the cheap labor of other countries, with little or no protection, its permanent success is only made possible by improved machinery or processes by which the cost here is made less than by the old-time methods employed abroad. As an instance, a dispatch from Zanesville, Ohio, relates that parties in an Eastern State propose to set up a plate-glass plant in that city. "They are glass-workers, and claim to have invented a method which they assert will cheapen the process by one-half. Instead of having the glass full of waves when first rolled out, as with the iron rollers under the old process, the glass is cast perfectly smooth, and almost as polished as the old plate glass after the latter has been polished by special machinery for 14 hours. The 12 hours' grinding and the wasting of from one-half to two-thirds of the material in order to get a plane, level surface is also avoided. It is said that the new plate-glass company at Washington, Pa., is trying to secure the method for use for the plant which is to be erected there. The parties owning the plant say that a plant covering two acres will have a capacity twice as great as the plant in which the men are now employed, which covers six acres."

COMPRESSED POLISHED SHAFTS.—An article has been made in Germany for about two years which has attracted great attention in industrial circles; we refer to the compressed polished shafts. The valuable qualities of these shafts, it is thought, will assure their speedy introduction and general adoption. These shafts, which can be welded and tempered, possess a torsion strength more than double that of turned or rolled shafts. They are made of pure, soft Siemens-Martin steel containing from 20 to 25 per cent of carbon. It is the carbon that causes the shafts to have a tenacity of 50 per cent greater than ordinary shafts, and while possessing seven-tenths the diameter and half the weight of the latter, they afford equal security. They are perfectly round and straight, are exact in caliber, and do not need turning. From a number of experiments made by Messrs. David Kirkaldy & Son of London, it was shown that their limit of elasticity was 79,200 pounds (English), that of ordinary iron being 23,800 pounds, and of patent rolled shafts 60,600 pounds. The relative strength is, iron, 1000 pounds; patent rolled shafts, 1505 pounds; compressed polished shafts, 1601 pounds. This compressed material can be used for a variety of purposes, as pulleys, guide-rods, piston-rods, pump-rods, slide bars, etc., axles, spindles, bolts, in agricultural implements, printing, weaving, spinning, sewing, washing machines, etc.; in short, wherever drawn or turned material is now used.

SCREWS.—It is not known when screws were first made and brought into use. The first instance known of machinery being applied to the making of screws was in France in 1569, by a man named Besson, who contrived a screw-cutting gauge to be used in a lathe. The early method had been to make the heads by pressing the blanks while red-hot between dies, and then to form the threads by the process of filing. In 1741, Besson's device was improved by Hindley, a watchmaker of York; and for a long time the watchmakers of England employed the latter's method in making the small screws used in their work. The first English patent appears to have been issued to Job and William Wyatt, in 1760, for three machines, one for making blanks, another for making the heads, and a third for cutting the threads. Between that date and 1840 about ten patents were issued, only one of which is worthy of notice, namely, that of Miles Barry, dated Jan. 28, 1837, which was for a gimlet-pointed screw.—*Builder and Woodworker.*

PETROLEUM MOTORS are being simplified and improved to such an extent, says an English journal, that they may now be ranked among the useful small motors. In one manufactured at Berlin, ordinary lamp petroleum is used with success, and a number of these little engines, varying from one to four-horse power, have been running for over a year in different parts of Germany and Russia; while in Belgium, a company for their construction has been formed, and the works (situated in Brussels) are in full swing.

THE DEMAND FOR LOCOMOTIVE ENGINES at present exceeds the supply, and this has been the condition for some time.

SCIENTIFIC PROGRESS.

The Sound of Light.

Experiments have long since proved that light exerts a projectile or pushing force; and more recently it has been shown that a beam of light may also, under certain conditions, produce sound. A beam of sunlight is thrown through a lens on a glass vessel that contains lamphack, colored silk or worsted, or other substances. A disk having slits or openings cut in it is made to revolve swiftly in this beam of light, so as to cut it up, thus making alternate flashes of light and shadow. On putting the ear to the glass vessel, strange sounds are heard so long as the flashing beam is falling on the vessel.

Recently a more wonderful discovery has been made. A beam of sunlight is made to pass through a prism, so as to produce what is called the solar spectrum or rainbow. This disk is turned, and the colored light of the rainbow is made to break through it. Now place the ear to the vessel containing the silk, wool, or other material. As the colored lights of the spectrum fall upon it, sounds will be given by different parts of the spectrum and there will be silence in other parts.

For instance, if the vessel contains red worsted, and the green light flashes upon it, loud sounds will be given. Only feeble sounds will be heard when the red and blue parts of the rainbow fall upon the vessel, and other colors make no sound at all. Green silk gives sound best in red light. Every kind of material gives more or less sound in different colors, and utters no sound in others. The discovery is a strange one, and it is thought more wonderful things will come of it.

THE NEW MATERIAL FOR CLOTH.—A detailed description has appeared of Mitchell's most interesting process for producing cloth from wood. Thin boards or laths, free from knots, are cut into strips in the direction parallel with the grain, and are holed in a solution of sulphurous acid or bisulphite, this hoiling effecting disintegration without the strips being reduced to very small pieces. The wood, after hoiling, is dried in the open air, and when dried the fiber becomes comparatively strong. The damp masses on the frame are transferred to a traveling endless cloth, which leads them to a pair of rollers, which may be plain or provided with corrugations in the direction of their length, the ribs of the one roller being made to gear into the recesses of the other one, whereby they effect a simultaneous strong bending and squeezing of the masses. The cutting of the material in passing through the rollers is avoided by causing the endless cloth to pass over the lower roller, and by placing a canvas covering around the upper roller. The pressed masses fall from these rollers on to a second endless cloth which conveys them to a second pair of rollers, from which they are conveyed to a third pair—and so on, for six times. By continued treatment of the wood the fibers become at length so pliable and isolated from each other that they can be employed directly for coarse filaments; but to obtain a long fiber, the hoiled and pressed masses are completely dried, then combed in the direction parallel with the fibers, similarly to the operations for combing flax, cotton, etc. The separation of the extractable matter from the fiber produced by boiling the gums and soluble organic matter can be effected at any time, though it is preferable that this be effected after the fiber has been spun into threads, etc.

THE NATURE OF GRAVITATION.—Some one asks the *Manufacturer and Builder* what the opinion of the scientists of the present day is in regard to the "real nature of gravitation." That paper in reply says: "The 'real nature of gravitation' is as much of a mystery to-day as it was to the philosophers of Newton's time. This philosopher succeeded in establishing, by mathematical reasoning (proceeding upon the observed motions of the heavenly bodies), the fact that they mutually attracted one another according to a definite law which he formulated, and which has since been known and accepted as the law of universal gravitation. To explain the mutual action of bodies at a distance as great as that which separates the celestial bodies, without the intervention of some medium by which the force may be conveyed from one to the other, seemed to Newton inconceivable; and the impossibility of conceiving the transmission of actions in an absolute vacuum has caused the universal acceptance by philosophers of an ethereal medium distributed throughout all space, and existing within material bodies; and all the phenomena, by means of which we are made conscious of the external world, are supposed to be produced by various affections of the ether. We know not if gravitation is a pushing or a pulling force, as our inquirer crudely puts it. On one hypothesis it is assumed to be due 'to the impact of ultramundane corpuscles,' which would make it a 'pushing' force. We commend to this inquirer the reading of the article on 'Attraction' in the *Encyclopedia Britannica*, which is a very good resume of the subject."

MAGNETIC PHENOMENA.—In a recent lecture by Mr. Shelford Bidwell before the Royal Institution of London on Magnetic Phenomena, that gentleman, after some introductory re-

marks on the nature of magnetism phenomena and on Faraday's conception of "lines of magnetic force," called attention to a very delicate reflecting magnetometer, consisting of a small magnet attached to a suspended mirror, the deflections of which were made visible to the audience by means of a lamp and scale, in the usual manner. He then proceeded to show that various small iron objects, such as a pocket knife, a nail and a door key, none of which had been intentionally magnetized, nevertheless exhibited traces of magnetism. The well-known experiment, illustrating the earth's power of magnetic induction, consisting in holding a bar of soft iron in a vertical position and observing its polarity, then inverting it and tapping it, on which its polarity is reversed, was very well shown by the magnetometer, a very light tap being sufficient for the purpose. A soft-iron bar, which had previously been deprived of its magnetism by raising it to a yellow heat and allowing it to cool in an east and west direction, and therefore with its length perpendicular to the earth's line of force, was then moved parallel to itself into the neighborhood of the magnetometer without producing any sensible effect; but a deflection was immediately visible when the bar was turned into a vertical position, the direction of the deflection showing that the lower end had become a north pole.

PRIMITIVE METHODS OF MAKING FIRE.—It has been discovered by Dr. Adler of Johns Hopkins University that the Acaadian fire-god was represented by crossed sticks in the position in which they are held when fire is being made. As the records of these people are among the very oldest known, the method of making fire by twirling one stick on another may be regarded as the most primitive. The spark struck from two pieces of flint will not ignite tinder. In order to get fire by the use of a flint it is necessary that a piece of pyrites, iron or steel be used. As no one has ever found a piece of flint together with a piece of pyrites, it is safe to say that the Indians knew nothing of this method of making a fire.

CAMPOR AND NAPHTHALINE.—The advanced and advancing price of camphor, druggists state, will result in greatly increasing the demand for naphthalene. This is a comparatively new product of petroleum, and is a powerful disinfectant and effective protection against moths and kindred insects, and with camphor likely to reach 60 cents a pound and perhaps \$1, as many venture to predict, an active demand for it is anticipated. It is so new that it has not come into general use as yet, though a steadily growing demand for it is noted; but for camphor in many of its uses there is no satisfactory substitute, and no weakening in the market is regarded as likely for an indefinite time.

SMOKELESS POWDER RENDERED USELESS.—When the announcement was made that smokeless powder was a success, there was great exultation among military men, as it was thought that it would be possible to watch the maneuvers of an army and command them to much better advantage. A French genius now comes forward with an invention which knocks the smokeless powder into the shade. It is a smoke bomb which is capable of creating vast clouds of smoke and can be fired into the ranks of an enemy who uses the smokeless powder, obscuring his view and placing him at the same disadvantage as if he used the old-fashioned powder.

THE MOON AND THE MAGNETIC NEEDLE.—An Australian meteorologist claims to have ascertained by careful investigation that the moon has an influence on a magnetic needle, varying with its phases and its declination. The phenomenon is said to be more prominently noticeable when the moon is near the earth, and to be very marked at those periods when she is passing from the full to her first and second quarter. It also appears that the disturbances in question are at their maximum at the time when the moon is in the plane of the equator.

EARTH-SHINE OR ASH LIME.—The pale, delicate light, which renders visible the unilluminated portion of the moon's disk is called the "earth-shine" or "ash lime." It is caused by the reflection of the sunlight upon earth to the moon, from which body it is reflected back to the earth, and is most conspicuous when the unilluminated portion of the moon is smallest, as about the time of the full moon.

WASTE AND DAMAGE IN THE USE OF COAL.—Tests made in London have shown that the value of coal wasted in smoke from the domestic fireplaces in that city amounts to \$11,282,500 annually, while the aggregate waste of unconsumed carbon is \$13,000,000 a year, and the damage to property caused by smoky atmosphere is put down at \$10,000,000.

A NOVEL TELEPHONE.—Invented by an American, has for its primary feature the transmission of sound by the vibration of glass. From a glass diaphragm extend a number of glass tubes of various sizes communicating with an ordinary wire. Very clear and distinct utterance has been found to result on trials over a line three miles long.

UNVENTILATED CARS.—W. R. Nichols, a well-known chemist of Boston, says he has found twice as much deadly carbonic acid gas in the air of an unventilated passenger car as in one of the main sewers of the city of Boston.

GOOD HEALTH.

Health of the State.

The March issue of the circular of the State Board of Health gives reports from 101 localities representing a population of 855,000, of which 1189 deaths have occurred, and a rate of mortality of 10.56 per thousand. An important decrease from the February report. Diseases from the respiratory organs continue to add to their quota to the bill of mortality.

The reports do not indicate much subsidence of the diseases of the respiratory organs so prevalent in January and February. Pneumonia, bronchitis, congestion of the lungs and influenza were reported in almost every locality heard from. Influenza is, however, subsiding, and no longer partakes of the epidemic form. The health officer in Trinity county reports the death of 4 Chinamen from "La Grippe," which is a remarkable circumstance, as the Chinese, as a rule, do not seem to be as susceptible to the disease as the white people. It must, however, be recollected that the accuracy of Chinese statements as to the nature of disease is very liable to error.

The precautions now quite generally taken to isolate patients afflicted with diphtheria and croup appear to be effective in preventing the spread of the infection, as no reports are received of these diseases being epidemic.

Important Health Considerations.

Typhoid fever is noted in some localities; but it is not as prevalent as it will be when the ground begins to dry after the excessive rains of the past season. This is accounted for from the fact that: "The occurrence of unusual amounts of rain supersaturating the earth disturbs the contents of privies and cesspools, causing the carriage from these receptacles to be deposited in new localities and perhaps at far distant points. Now, supposing any of the contents of these privies and cesspools contained the germs of typhoid fever, their deposition on the ground and subsequent desiccation or carriage into our water supply might be the cause of a serious epidemic. We know, at all events, that the putrefaction of organic matter is inimical to health, and the debris left after the subsidence of large accumulations of water should be removed from around our dwellings, our out-houses, our alleys and our streets, carried away and buried deep or burned. The cleansing of our premises is now a wise precaution against future sickness, and as typhoid fever is peculiarly a filth disease, its mode of prevention is essentially cleanliness."

"The typhoid germ can be swallowed in food as well as drunk in water. Prof. Vaughan of the Michigan University discovered the bacillus in sewer air, and Dr. Baker, the eminent Secretary of the State Board of Health of Michigan, contracted the disease. It is supposed, from the air of this very same sewer. Our health officers are therefore requested to urge upon their several districts the extreme necessity that exists at this time to remove all accumulations of debris and filth from about their habitations, as what are now comparatively harmless deposits will, in the presence of increasing temperature, become masses of putrescent and dangerous organic matter, that is certain to deteriorate the health and infallibly expose the system to a condition favorable to the receptivity of disease germs and their successful cultivation in the soil thus prepared for their accommodation and development. It is only by the education of the public to these dangers that we can hope to avoid them, and to the health officers the public look for such information, and for such safeguards to its health which their education in sanitation particularly enables them to supply and direct."

Cancer.

The terrible malady of cancer is credited with 41 deaths during the month. If some one or more of the more progressive and humane members of the faculty would lay aside their cherished ethics for a time, and make some honest inquiry into what is being done in this city in the private treatment of this disease, they would not only be astonished at what they can be shown, but would start a movement which would eventually save thousands monthly in this country, alone, from death by one of the most terrible maladies with which humanity is afflicted. A few hours of preliminary observation would be sufficient to so interest any really sincere investigator that he would be willing to take whatever further time would be necessary for the most thorough investigation of the whole matter.

Antiseptic Value of Eucalyptus.

Writing to the Selma Irrigator about *eucalyptus globulus*, W. A. Sanders says:

In soaking up old wine or vinegar casks, we throw a few blue-gum boughs with their leaves into the water, and it never becomes putrid, while without the blue-gum we would have to change the water daily to prevent putridity and spoiling of the flavor of anything afterward kept in the cask.

We have kept fresh beer eight days in the hottest weather by keeping around it a plentiful supply of green blue-gum leaves and changing them daily.

A decoction of green leaves is a stronger and more lasting stimulant than tea or coffee, and more salutary in its effects, as it does not cause

wakefulness. It seems to have the stimulating effect of quinine without any of its injurious qualities.

CANINE CURE FOR RHEUMATISM.—The Wheatland Four Corners avers that a certain Grass Valley man has slept with a dog in his bed every night for the last 20 years. He claims that a dog in bed with a person will draw the rheumatism out of the person into its own body. He says he has used up three dogs in that period, they having become prostrated with the disease contracted from his chronic ailment.

USEFUL INFORMATION.

OSCILLATIONS OF HIGH CHIMNEYS.—A French journal gives some particulars of the oscillation of a chimney-stack near Marseilles, 115 feet high, with an exterior diameter at the top of four feet. During a severe storm it was determined, by observing the shadow of the chimney, that its greatest oscillation was nearly one foot eight inches. It was further observed that a chimney set in motion by a gust of wind oscillates from four to five times backward and forward until it is at rest again. M. E. Barg asserts that should this momentum during the oscillations of a chimney repeat itself in such a manner that its direction coincides with that of oscillation, the overthrow of the chimney may be expected. This is the explanation given for the destruction of many a chimney constructed in accordance with sound principles of stability. In the case of a chimney near Vienna, 164 feet high, and constructed of concentric hollow rings, with an inner diameter to the top of 6½ feet, which is exposed to considerable gusts of wind, the oscillations were most carefully and repeatedly measured with a theodolite, when the observations showed an extreme oscillation of only 16 centimeters (16½ inches) during severe storms.

A NOTABLE FACT in connection with a public manual training school in Philadelphia, as reported in a local paper, is that of the boys now in the training school and learning the use of chisels and hammers and lathes, fully three-fourths are the sons of professional and business men—many sons of doctors and ministers and lawyers. Of the 77 occupations recorded of parents of boys now in the middle class, 34 are those of professional or business men and 23 those of men engaged in other pursuits, of whom only 14 are artisans. On the other hand, it is stated that children of mechanics in that city are "striving to get into the ranks of the struggling and poorly paid professions." Well, it wouldn't do for all to be mechanics; and nine times out of ten the workman's son becomes the most successful lawyer, doctor or clergyman. His self-reliance and ambition generally overcome all obstacles.

A NEW MINERAL OIL which will be known as "dynamine," having the consistency of butter, has recently been introduced to the manufacturing public by La Compagnie Française des Graisses Minérales Consistantes. The new substance is not acid, and is free from resinous matter and drying oils. It is very stable in character, and does not undergo any change when exposed to the air. Its buttery consistency does not appear to be due to the addition of paraffine, vaseline or wax to a liquid oil, as it has a definite melting point at 84° C., and does not inflame at a temperature lower than 220°. In color it resembles butter, and it has no appreciable odor. These properties give it an especial value as a lubricator, and as it has no chemical action on metals, dynamine is likely to be extensively used for this purpose.

LEATHER FROM WOOD.—It is said that one Dr. George Tenius of Vienna has a process for the manufacture of artificial leather from red beechwood. The best wood for the purpose is taken from 50 to 60-year-old trees, cut in the spring, which must be worked up immediately, bark peeled off, steamed, treated with chemicals in a kettle under pressure, and exposed to several more operations which the inventor does not mention, as he wants to have them patented. From the prepared wood, strong and thin pieces are made by means of pressure. The inventor states that solid sole-leather can be obtained, which he claims is superior to the animal leather in firmness and durability, and can be worked up in the same way as animal leather, nailed and sewed.—*The Tradesman*.

VARNISH FOR COPPER WORK.—In varnishing new copper work, use hotted linseed oil; it stands the weather as well as the best coach varnish, although it does not make so smooth a surface, and is much cheaper. Two coats are sufficient; let the first coat dry thoroughly before the second is applied.

A USE FOR THE PHONOGRAPH.—For political, religious and reform purposes, it is proposed that, instead of sending speakers to all parts of a State, to provide phonographs loaded with appropriate addresses, send them from one point to another, and turn them loose at every public gathering.

BRICK FROM SLATE.—Northern manufacturers are interested in the statement that the finest brick made in the South are from the refuse of slate quarries. They have a double resisting power and absorb only one-third as much water as ordinary brick.

ENGINEERING NOTES.

RUSSIAN ENTERPRISE.—It seems probable that the Russian Government will shortly begin the construction of the great canal between the Onega lake and the White sea, connecting that sea with the Baltic, plans for which have been for some time under consideration. It is estimated that the length will be 235 kilometers, of which 138 kilometers are natural canal, while the depth is to be three meters. The cost of the canal alone is estimated at seven and a half million roubles; but with a harbor constructed at Wyg, on the White sea, and dredging of the river Svir, the cost will be ten million roubles. In regard to the Siberian railroad, the statement has been made that the Rothschilds have relinquished that enterprise by refusing the loan of two hundred and twenty millions asked from them. The Rothschilds are not now the only money kings in the world. If Russia finds it for her interest either pecuniarily or as a war measure to build that road, the Rothschilds will not be able to prevent its construction by simply refusing to furnish the means. There is scarcely a doubt but that the road will be completed at an early day. It will open up to commerce one of the finest sections of country in the world, and with its active operation the present disturbing question of excessive cruelty in connection with Siberian exile would soon come to an end.

THE BRIDGE ACROSS THE BOSPHORUS.—It is reported that a French syndicate proposes to build a bridge across the Bosphorus. It is thought that the bridge, by linking the Asiatic and European railway systems, would be sufficiently useful to justify the enormous expense which it would entail, and would eventually pay for itself. The French engineers who are ready to undertake the construction have fixed upon Roumeli Hissar as the point from which the bridge would start, the distance thence to Anadol Hissar being 2624 feet. It is understood that it is proposed to make the bridge with one span only. The longest bridge span at present is 1710 feet. If the Bosphorus should be crossed by a single span of 2624 feet that would be considerably less than the present proposed span across the Tagus at Lisbon, which exceeds 3000 feet in length. There appears to be no limit to modern engineering.

WAVE-POWER.—The force exerted by waves beating on the seashore can be averaged. It has been ascertained that a rolling wave, 20 feet high, will exert a force of about one ton per square foot. The action of waves is most destructive at low-water line, while the extreme height of mid-ocean waves is estimated to be from 20 to 22 feet. The average force of ocean waves has been estimated to be 611 pounds per square foot during summer and 2086 pounds during the winter months. During a heavy gale a force of 6983 pounds was ascertained. Such a wave-power machine was in partial operation some years ago on the ocean beach, beyond the Cliff House, but the inventor neglected to provide for the extra energy developed in the waves by rough weather, and the motor was wrecked.

THE GREAT COLORADO TUNNEL, which has been for 10 or 15 years in slow process of construction under the auspices of "Brick" Pomerooy, through the Rocky mountains, has a prospect of being at length completed and employed for railroad purposes. This tunnel is located 60 miles due west from Denver. It will shorten railway distance 250 miles between Denver and Salt Lake City. More than 4600 persons are now financially interested in the enterprise. The tunnel will be five miles long and 4400 feet below the top of Gray's peak. The company enters the year 1890 entirely free from floating debt, all its bills paid and work going ahead day and night in both ends of the tunnel. By the use of modern machinery from six to ten feet headway is gained every day.

ENGINEERING EXTRAORDINARY.—Recently, by accident, the New York end of the Hudson River tunnel was seriously flooded, and all ordinary methods of stopping the leaks proved unavailing. At last Engineer Moy contrived a novel means of finding the holes. On Thursday he secured a number of water rats, tied long pieces of oakum to their tails, caught in the middle by a piece of wire. The rats were then forced into the caisson through the air pumps. The rats, following the current of air, found the leaks, and, passing through the crevices, left the oakum behind. This stopped the ingress of air sufficiently to enable the pumping to proceed with success.

A NEEDED WORK.—The Government appears to have under serious consideration a proposition to construct a canal around Niagara Falls to accommodate American lake shipping and war vessels in case of an emergency. According to the plans under consideration, it will cost \$23,000,000 and will have a depth of 20½ feet. The necessity of such a canal, it is argued, is made apparent by Canadian discrimination against vessels of the United States passing through the Welland canal.

THE LONGEST BRIDGE IN THE WORLD, if built according to present estimates, will be constructed by the Roumanian Government across the Danube between Dadesci and Tohervavoda, thus effecting a junction between

Hustenega harbor and the Western railway of Roumania, which already runs as far as Dadesci. As there is a large tract of marshy ground on the left bank of the Danube where the bridge will be built, this will have to be no less than 20 miles in length.

ELECTRICITY.

Steam and Electricity—Partners.

Steam and electricity instead of being rivals are partners. The statistics of steam engines show a greater demand than ever before, while, at the same time, the electrical field has known an extraordinary development.

Early in the electrical era the enthusiast declared that his favorite force would usurp the place of steam, to which the steam men replied that they'd wait and see.

They have waited, and what they have seen is something quite different from what they had been led to expect by the prophecies of overanguine electricians. The more electric light and power developed, the greater has been the demand for steam. For though, in isolated and widely separated instances, electrical generators are turned by water-power, steam is almost universally employed; at least, as yet, is indeed the only certain and expeditious mode of performing the service.

And so it is; you may follow the wire from the light, trace the main to the source where it gets its energy, and there you will find—the steam engine.

The effect of the coming of electricity as a motive force into the field occupied by steam finds a striking parallel in the effect of electricity, as an illuminant, upon gas.

When Edison announced his discovery of a means of subdividing the electrical current, the gas men trembled, for it was known he was no idle hoaster. The answer came next morning from London that gas stock had declined \$1,200,000 (\$6,000,000) at the news.

Everybody would, of course, prefer electric lighting to gas, there would be no demand for this product of coal, and the gas companies would collapse or go into the hands of receivers.

So it was thought.

What really happened was a surprise to every one.

Wherever the electric light came into use the demand for gas increased.

People became used to an intense light. Shops with two gas jets aglow in their windows appeared dingy in the neighborhood of a big voltaic arc light, so the keepers turned on four jets. Those with five turned on ten, and so on.

And so it was that the gas people who once looked forward to electric illumination with fear and trembling came to regard it with equanimity if not with positive friendliness.

In the matter of power distribution the case is not essentially different. What were formerly small steam-users, are more and more inclining to the use of electricity; getting their power from a motor energized by wire from electrical-power vendors. But, as a set-off to this, there is an enormous demand from one end of the land to the other for powerful steam engines to drive electric-lighting dynamos.

Before the advent of electric lighting there was, of course, no such demand; the gas companies attending to all the lighting without the interposition of steam engines at all.

Engine-makers are, therefore, indebted to electricity. It is a benefactor rather than an enemy, a partner rather than a rival.—*The Safety Valve*.

GROWING DEMAND FOR ELECTRIC MOTORS.—The uses of the electric motor are multiplying daily, and one of the indications that its adaptability is recognized by the public is that machines for both constant potential and constant current systems have been manufactured during the past year at the rate of upward of 250 per week, and their rating will exceed 700-horse power. In spite of this great output of electrical apparatus, every portion of which finds an immediate sale, nearly all the factories are behind in their orders to such an extent that it is nearly impossible to fill orders under 60 days. Motors have been introduced for every conceivable purpose to which power can be applied, and small industries run by electric-power have started up in many places where steam power could not have been utilized. The use of the storage battery is also rapidly increasing.

ELECTRICITY ON THE SUEZ CANAL.—The use of electrical lights, by which business may be pushed as rapidly by night as by day on the Suez Canal, has doubled the capacity of that great international thoroughfare. Were it not for the electric lights, immediate preparations would have to be made for increased facilities by enlarging the width of the canal. It is claimed by the managers that the effect of the electric light has been the same as if the canal had been increased from 22 meters, its present width at the bottom, to 32 meters, an operation which would have cost the company \$20,000,000.

FLORIDA FIBERS.—A company in Florida has for several years past been manufacturing cordage, mattresses, etc., from bear grass, sisal hemp, palmetto, jute and other Florida fibers with much success. It is now manufacturing a substitute for hair in mortar used in plastering.

TABLE OF CONTENTS.

EDITORIALS.—The Thompson Engine, 279. Passing Events; Drift Mining in Placer County; The Earthquake; More Pelton Wheels for Japan; The State Mineralogist's Report; The Molders' Strike, 283. ILLUSTRATIONS.—At the Mouth of the Tunnel of the Hogsback Mine; The Thompson Automatic Engine, 279.

CORRESPONDENCE.—The Deep Gold Placers of California, 280.

MISCELLANEOUS.—Coast Industrial Notes, 280. Legal Points in Levee Building; Sampling Auriferous Quartz; Mining Engines, 281.

MECHANICAL PROGRESS.—Blacksmiths and Their Calling; Tempered Copper Boxes and Bearings; Testing Cast Axles; Coke and Whitewash in Steel-Making; The Plate Glass Business; Compressed Polished Shafts; Screws; Miscellaneous, 284.

SCIENTIFIC PROGRESS.—The Sound of Light; The New Material for Cloth; The Nature of Gravitation; Magnetic Phenomena; Primitive Methods of Making Fire; Camphor and Naphthalene; Smokeless Powder Rendered Useless; The Moon and the Magneto Needle; Earth-shine or Ash Limb; Waste and Damage in the Use of Coal; Miscellaneous, 284.

GOOD HEALTH.—Health of the State; Antiseptic Value of Eucalyptus; Canine Cure for Rheumatism, 285.

USEFUL INFORMATION.—Oscillations of High Chimneys; Leather from Wood; Varnish for Copper Work; A Use for the Phonograph; Briok from Slate; Miscellaneous, 285.

ENGINEERING NOTES.—Russian Enterprises; The Bridge Across the Bosphorus; Wave-Power; The Great Colorado Tunnel; Engineering Extraordinary; A Needed Work; Longest Bridge in the World, 285.

ELECTRICITY.—Steam and Electric—Partners; Growing Demand for Electric Motors; Electricity on the Suez Canal; Florida Fishes, 285.

MINING SUMMARY.—From the various counties in California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 282-283.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 288.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, 288.

Passing Events.

The fact that the Risdon Iron Works of this city will put in ships for Cruisers Nos. 2 and 6 shows that our shipbuilding industry in California is likely to increase largely, since this firm is prepared to establish the necessary plant to do this Government work. The Risdon has done a great deal of successful marine work, but this will be its first attempt on large Government vessels. It has already furnished machinery for some of the smaller Government craft.

The merchants of the city have subscribed \$10,000 to the foundrymen to aid them in their present emergency, in order to assist in putting a speedy end to the molders' strike, which is doing so much harm to the local iron industry. This substantial money aid and the increasing numbers of molders in the shops, are very satisfactory signs to the foundrymen that they will eventually win.

The earthquake of Thursday morning was the most vigorous, with one exception, since the memorable one of 1868.

There is a great quantity of snow on the mountains and water will be abundant for mining operations for a long season. At present there is still rather too much, as pumps are everywhere kept busy. The mining industry will make a good showing this year.

THE House Committee on Naval Affairs has reported back favorably the bill for the relief of the Union Iron Works of San Francisco and to allow them the amount of the penalty of \$33,384 exacted by the Government and retained from the contract price for the construction

tion of the cruiser Charleston because of the failure to secure the required horse-power. The report sets forth that the trouble was not with the contractors, but with the plans and specifications furnished by the Government, which were strictly followed in the construction of the vessel. While the horse-power developed is less than was expected, the speed is greater than was designed, and as speed was the great object sought to be obtained by the horse-power, the Government has in the result a better vessel than was contemplated by the contract.

Drift Mining in Placer County.

The Hogsback Mine on the Forest Hill Divide.

The Hogsback drift mine, on the Forest Hill divide, Placer county, consists of several locations comprising 682 acres in all. The stock is all held in Paris, France, the name of the company being the "Compagnie des Mines d'Or du Forest Hill Divide," with Eugene Raveney as president. The original company which owned this ground prospected it by a short tunnel and broke through into cement, finding their tunnel too high. They donated the property to the present company for \$25,000, and a purchase was concluded. The new company commenced work April 28, 1888. They ran a 7x8 tunnel 80 feet lower than the old one, and broke through into cement. At 1100 feet they made an upraise of 75 feet in bedrock without striking cement, and at 1320 feet they sank four shafts and two stopes a total depth of 226 feet below the bottom of the end of the tunnel, struck 20 miners' inches of water and were "drowned out." The pitch of the bedrock to where they broke through was an average of 38°, and washed very smooth. This tunnel had to be abandoned as not low enough to bottom the channel. Work on the tunnel was commenced by hand on May 18, 1888. A distance of 248 feet was run by hand, three shifts, of five men each, laying their own track and removing their own dirt. The average distance made per week by hand was 35 4 feet. The following statement shows the greatest week's work by hand:

PROGRESS FOR A WEEK 48.7 FEET.	
12 men, 7 days (84 days), at \$3.....	\$252 00
3 men, 7 days (21 days), at \$3.....	63 25
1 man, 7 days (7 days), at \$3.....	24 50
114 lbs. safety niter p. water No. 2, at 18c. per lb.....	20 52
350 feet triple taped fuse, at 72c. per 100 feet.....	2 52
50 lbs. chemical wax candles, 14 oz., at 13c. per lb.....	6 62
2 boxes xxx blasting caps, at 80c. per box.....	1 60
224 feet lumber, at \$22.50 per M.....	5 04
1040 lbs. steel rails (16 lb) (195 ft.) at 4c. per lb.....	41 60
Boles and fish-plates, at 50c. per pair.....	4 00
Car oil.....	15
40 bushels charcoal, at 20c. per bushel.....	8 00
Wear and tear, etc.....	1 00
Total cost.....	\$435 80
Cost per foot.....	8 94

Not a timber was used in this ground, and it is still standing without any.

On the 8th of July, 1888, the Ingersoll straight-line air-compressor, class A, was started, and by December 27th the tunnel had reached a length of 1559.6 feet.

At a distance of 1320 feet, they broke through into a hard mountain cement, and anticipated making greater headway, but found it was very nearly as costly as the rock. During the time they were in bedrock the average progress per week with machine drills was 58.94 feet for 1320.7 feet of tunnel, requiring but 21 sets of timbers, showing that the ground is not soft. Average numbers of holes per shift 10, blasting the cut and top holes first, bottom holes afterward. The two largest runs made for two consecutive weeks were 73 6 feet for the week ending August 4th, and 66.9 feet for the week ending 11th, or respectively, 10.51 and 9.55 feet per diem.

The tunnel runs diagonally across the strike of the rock (the strike, however, varying very much, sometimes being at right angles with the tunnel), which is composed of alternate strata of slate, diorite, and some white barren quartz.

The regular force of men employed consists of 15 miners working 8 hours per day; 2 engineers, working 12 hours per day; 2 drivers, working 12 hours per day; two blacksmiths, working 10 hours per day; one timberman, working 10 hours per day, divided into three shifts, and working two 3½-inch Ingersoll Eclipse drills on columns.

They have three 3½-inch Ingersoll Eclipse drills, and the total cost for all extras for 1559.6 feet of tunnel was \$132.75. A stringent rule was enforced, requiring each drill to be

taken out and thoroughly cleaned once a week.

The actual cost of the 1559 6 feet of tunnel, 7x8 feet, exclusive of management, up to Dec. 27, 1888, was as follows:

	Cost per running foot.
Total labor (including timbering).....	\$12,131 49 \$7 77
Powder, 10,021 lbs., at 14c. (delivered).....	1,478 20 90
Fuse, 23 045 ft., at 54c. per 100, and caps, 840.....	165 59 10
Wood, 522 cords of wood, at \$2 75 (delivered).....	1,435 50 92
Charcoal, 1580 bushels, at 20c.....	316 00 20
Candles, 1755 lbs., at 13c. net.....	232 53 14
Gang planks and ties, 7624 ft., at \$22 50 per M.....	171 54 10
Timbers, 21 sets, at \$1.30 per set.....	37 80 02
Steel rails, etc. (16 lbs.) 20,048 lbs. at 4c. net.....	801 92 61
Air and 1800 ft. 3 in. at 29c. \$531 00	
water pipes 1700 ft. 1 in. at 6c. 102 25	761 43 48
Freight on same 124 18	
Horse feed, hay, 25; barley, 3c. per lb.....	349 60 22
Materials, steel drill parts, oil, tools, etc.....	916 33 58
Totals.....	\$14,797 83 \$11 94
Actual cost per running foot.....	11 94

These tables of progress and cost of tunneling are of great interest to drift miners in this State.

As stated, however, this tunnel was found to be too high, and was abandoned, and another one was started 437 feet lower, at an elevation of 4340 feet above sea level. This new tunnel was started Oct. 18, 1889, and is now in 1230 feet. It will be 2520 feet long when completed to the point where the upraise will be made to cap the channel of auriferous gravel. This upraise will be 190 feet. The course is diagonally across the strike of the rock which is harder than in the upper tunnel. The new tunnel is 7x8 in the clear with a three-inch grade to 100 feet. For the tracks, 16-pound steel rails are used, and the iron cars hold 2200 pounds of slate bedrock. Horses are used to haul the cars.

The air compressor is 600 feet above the present tunnel, where the works are. Air is carried in a three-inch pipe. An 18-inch Pelton wheel at the tunnel mouth runs a Starrevant blower, by water that is brought in an inch and a half pipe from the upper tunnel.

The energetic young superintendent, Mr. W. C. Ralston, kept the work going during the whole of this exceptionally rough winter. John C. McFall, the foreman, is the young man who had charge of the Horseshoe Bannell, below Forest Hill. For nine weeks one shift of men had to be kept shoveling away snow so that the cars could be dumped. A tunnel was made through the snow to the blacksmith shop. They had 18 feet of snow at the tunnel mouth in the ravine, and 21 feet at the office. On the first page of this week's PRESS is a photo-facsimile of the mouth of the tunnel of this mine, made from a photograph taken by Mr. Ralston before the snows set in. Last month they made 217 feet of progress and expect to get in and begin the upraise by the last of October.

The Earthquake.

At 3:37.44 A. M. on Thursday a sharp and vigorous earthquake was experienced here, which was the heaviest shock since the famous one of 1868, with the exception of that of July 31st last. The general direction of the movement was from southwest to northeast, and the duration about six seconds. The seismograph at the Chahot Observatory, Oakland, shows that the actual movement of the earth was only about one-seventh of an inch, but it was very rapid. The earth movements at such times are very much smaller than popularly supposed. The heavy shock of last July showed an actual movement of only three-sixteenths of an inch. Yet in that case and in this one many persons supposed that the movement was several inches. The earthquake of Thursday was fortunately very limited in duration, for if it had lasted very long with the same vigor, much damage to buildings and chimneys might have resulted. The seismograph shows no long swing, but a confused, rapid trembling motion, very quick and sharp. The mean-time clock at the Chahot Observatory was stopped, but the Siderial clock was not. At the time of the July shock the reverse was the case, the Siderial clock alone being stopped. On no occasion have both been stopped at the same time, though each has had its turn on different occasions.

At Buck's ranch, in Plumas county, the snow is packed 20 feet deep on a level. At Letter Box, Judge Clough, who has just arrived at Oroville, says he went down stairs 32 steps to get from the snow into Thomas Townsend's house. The snow there is 25 feet deep and is solidly packed.

The State Mineralogist's Report.

State Mineralogist Wm. Ireland, Jr., has just issued the Ninth Annual Report from the Mining Bureau, a volume of about 300 pages. In addition to the reports of deputies in the field in various counties of the State, there are several original articles as follows: "Refining and Smelting of the Precious Metals," by Sven Gunn's ex- "Auriferous Gravels of California, Geology of their Occurrences and Methods of Exploitation," by John Hays Hammond, M. E.; "Pottery," by Linna Ireland; "River Mining," by R. L. Dann, M. E.; "Value of Fossils as Indications of Important Mineral Products," by Dr. J. G. Cooper; "Clays," by W. D. Johnson; "Manufacture of Glass in California," H. De Groot.

The most complete and practical article in the report is that on "Auriferous Gravels," by Mr. Hammond. It is well illustrated, and describes fully the methods of mining the gravels. Numerous sections of drift and hydraulic mines are given with their geological features. Mr. Hammond describes the various gravel mines and gives the details of the methods of saving the gold, with the various mechanical appliances. A complete list is given of the prominent mining districts in the State, with their location, capacity, cost, etc. Mr. Hammond's paper, like his other one on the "Mining of Gold Ores" last year, is the feature of the report.

Equally useful in its special branch is Mr. Russell Dann's article on "River Mining." This branch of placer mining in California is fully described, and there are numerous illustrations. Mr. Dann gives details which will be useful to all interested in this branch of mining.

The reports on the counties are comparatively short this year, owing to the brief time when field-work was possible for the season. It is announced that a geological map of the State is in preparation by the Bureau.

The Molders' Strike.

The striking molders in this city still hold out in their fight, and do the best they can to prevent the foundrymen from getting men on their molding floors. More Eastern molders continue to arrive, however, and go to work in the shops. Several more came this week and were taken to the Union Iron Works without the strikers being able to see or talk to them. The molders have held a mass-meeting to protest against the importation of labor from the East.

Certain merchants of this city, who are anxious to see the iron trade again revived, have contributed \$10,000 in cash to the Foundrymen's Association, believing that the strike can only be brought to a close by the methods adopted by the foundrymen. Their success seems to depend on whether they can supply themselves with men to take the place of the strikers. This they are now successfully doing. The Risdon has 18 competent molders, as against 15 before the strike. The Union Iron Works has about 18, and other shops a proportional number.

The contract for the work to be done for the California-Street Railroad Company, which has caused so much controversy of late, was awarded to the Union Iron Works Wednesday. It amounts to about \$100,000.

The Risdon Iron Works will enter bids for the construction of Cruisers No. 2 and 6, and an improved plant will be obtained, so that all the work of building the ships can be done here.

More Pelton Wheels for Japan.

Evidence of the progressive character of the Japanese is being constantly furnished by their readiness to adopt American machinery in the prosecution of their various industrial enterprises. We gave a few months ago a description of a water-power hoist furnished the Japanese Government for operating one of their coal mines. A still more extensive order has recently been received from the same source by the Pelton Water Wheel Co., which has been completed, and went forward on the last steamer.

This consists of three eight-foot Pelton wheels of capacity of 108-horse power each working under a 90-foot head, and two double nozzle 6-foot wheels of capacity of 115-horse power each under same head. The former were fitted with the Pelton deflecting nozzle and

hydraulic governor, and the latter with the adjustable slide nozzle and friction governor.

These five wheels, having an aggregate capacity of 554-horse power, are to run dynamos, the power of which is to be transmitted to the city of Kito, two miles distant, to be used for general manufacturing purposes. The work above described is but the first installment of a plant of very considerable magnitude, it being the intention as soon as the present wheels are in place to order 15 more to bring the capacity of the plant up to 2000 horse power.

The water is conveyed to the wheels through 2000 feet of sheet-iron pipe, and the supply is obtained from the Kioto-Fu-Cho canal, a recently constructed work involving a large outlay and a high order of engineering skill, all of which has been supplied by native officials.

The Thompson Engine.

(Concluded from page 281)

canceling an earlier or later cut-off, according to the amount of work that may be on the engine at the moment. The governor is so arranged that a movement of only three-eighths of an inch of the governor-balls causes the engine to cut off at any point along the line, from zero to full stroke, thereby causing a remarkably steady motion, although the load may be constantly shifting.

The governor has a device by which, should the belt break or run off the pulley, the main steam-valve would be immediately closed and the engine shut down.

One of the most remarkable features about this engine is that all four of the valves and the cut-off are operated with but a single joint and one eccentric; said joint serves to connect the eccentric rod with the main valve-rod.

There is a 600-horse power engine of this kind running the Mendocino Lumber Co.'s saw-mill at Mendocino City. Mr. Ford, the superintendent at that place, informs me that the greatest variation he can detect in the speed of the engine, between a full load and nothing, is only a half a revolution.

There are at present a number of these engines running at various places on the Pacific Coast, ranging in size from 600-horse power down to 60, all of which are giving entire satisfaction to the owners and the engineers that run them. We are informed that they stand ready at any time to give the highest testimonials in their favor as to durability, economy, etc.

The Golden State and Miners' Iron Works of San Francisco, 231 to 251 First street, one of the oldest and most reliable shops in this city, are the sole builders of this engine for the Pacific Coast States and Territories. They ran one of them at the Mechanics' Institute Fair for 1889, in this city, for which they were unanimously awarded the gold medal. The Committee of Awards in its report says: "This engine, which is of the automatic independent cut-off class, presents many radical improvements upon those which have hitherto been considered the highest type of steam engineering practice, inasmuch as the same results are obtained with a great reduction in the number of working parts and joints. The engine is compact, strong and symmetrical in design, and presents a handsome appearance. It is fitted with four plain slide valves, working entirely independently of each other in separate chambers, all four valves and cut-off being operated with one eccentric. It is a remarkable feature of this engine that all four valves and cut-off are operated with but one joint or working part between them and the eccentric. The cut-off, which is exceedingly rapid, is operated by steam pressure. Owing to its simplicity, repairs would be reduced to a minimum."

If any one requiring further particulars in regard to the engine will communicate with the above mentioned foundry, the information will be furnished. The cut-off mechanism of these engines, with new cylinders, can be applied to any old engine that has either the box-form of frame or the Corliss. The above-mentioned company are driving their shops in this city with a Thompson engine, where it can be seen in operation at any time.

The Carson river is running bank full of water, and all the capacity of the mills is at work upon Cometock ore. The snow, which is piled high in the mountains, insures plenty of water for mining purposes during the summer months.

Mines at Benton, Mono Co.

Mr. W. H. Russell, superintendent of the Little Emily M. & M. Co., Benton, Mono Co., was in San Francisco this week, having come here to see certain lots of ore from the mine worked at the Selby Lead Works. The results are very satisfactory to Mr. Russell and the company. One of the lots amounted to 21,475 pounds net and yielded per ton of 2000 pounds

PROSPECTOR'S POCKET SCALE.

\$676.08 in silver, \$2.89 in gold and 5 per cent lead. Another lot of 40,732 pounds gave per ton of 2000 pounds \$195.50 in silver with a small percentage of lead. The silver was sold for 99 cents. The cost of working this ore was \$20 per ton. The railroad charges from

tain any gold, can be ground up fine with water and mercury in an agate mortar, or roasted in a clay dish with a little nitrate of soda, and there amalgamated.

The 4 pound samples are then to be treated as directed in using the batea, and the resulting amalgam put in a piece of charcoal, and the mercury volatilized by the aid of a blowpipe;

TAYLOR'S HAND CRUSHER.

the mine to the Selby works are \$8 per ton for ore working \$50 to \$100 per ton, and \$14 per ton for all working over \$200. The miners at Benton formerly paid \$100 per ton to get their ore brought to San Francisco.

From the Little Emily mine altogether some \$300,000 has been taken out in the last ten

years. The mine has been worked for 20 years. It is looking very well indeed at present, and the ore is rich. They are running a crosscut and extending the main tunnel. There are now no mills at Benton, so that all the ore has to be shipped away for reduction.

Mr. Russell says that mining matters are looking up in that region, and in Inyo county prospects are better than ever known before. The section referred to is a very encouraging one for prospectors now that there is a railroad to take the ore from the mines.

THE Nevada City Transcript says: In the Deer Creek claim at Mooney Flat, Measra. Ayer & Co. recently struck gray and blue gravel at a depth of 62 feet, and the shaft has since been sunk into it a depth of 10 feet without reaching bedrock. The gravel pays from \$20 to \$50 a ton. Some years ago Geo. McLean and others ran a \$250,000 bedrock tunnel to open this channel, but missed the mark and quit in disgust.

THE new patent combination rails, known as the Bargion rails, which the Southern Pacific Company has decided to give a test with a view to adopting them for general use over the system, are being laid on the Seventh-street local track, in Oakland, where it is thought they will be given a severe test.

ABOUT 100 men are at work on the electric street railroad in Oakland,

Sampling Auriferous Quartz.

(Concluded from page 281)

When all the gold is well collected in the center of the batea, a little pure mercury is added, sufficient to form a hard amalgam. This mercury being rubbed by the finger covered by a coat, will rapidly take up the gold, the wooden surface of the batea greatly assisting the operation.

The pyritic matter left, if thought to con-

of round glass. On the right-hand side of the fulcrum ten divisions are marked at equal distances from each other, and on the left-hand side a small depression is made to receive the globules of metal or a small pan for gold-dust. Above the fulcrum is a small vane, which being turned to the right or left adjusts the beam to equilibrium. The two small wires resting upon the beam keep it in place while the globules to be weighed are being placed on the beam. By a very slight pressure with the finger the wires are raised and allow the beam to work.

The number of weights required are three, made of flattened wire, viz.: 10 grains, 1 grain and one-tenth of a grain. The weights are moved from one division to another as required to balance the globules, keeping the flat side on the line of division.

This balance is very sensitive and will weigh to the one-thousandth part of a grain.

Holes are made in the wooden block to hold the blowpipe, pinettes, weights, charcoal, etc. The following table is to be used in connection with the balance:

PROSPECTOR'S AND MINER'S GOLD TABLE, TO DETERMINE FREE GOLD PER TON OF 2000 POUNDS AVOIRDUPOIS. SAMPLE FOR WORKING TEST, FOUR POUNDS AVOIRDUPOIS, 28,000 GRAINS.

Weight of washed gold; four-pound sample in grains and tenths.	Finest, 200 value per oz. \$17.15	Finest, 200 value per oz. \$18.05	Finest, 200 value per oz. \$19.05	Finest, 200 value per oz. \$20.05
5 grains.....	\$82.07	\$89.26	\$94.26	\$99.05
4 grains.....	67.18	71.40	75.36	79.24
3 grains.....	50.38	53.45	56.52	59.43
2 grains.....	33.59	35.74	37.68	39.62
1 grain.....	16.79	17.87	18.84	19.81
.9 grain.....	15.11	16.08	16.95	17.82
.8 grain.....	13.43	14.29	15.07	15.84
.7 grain.....	11.75	12.51	13.19	13.86
.6 grain.....	10.07	10.74	11.31	11.88
.5 grain.....	8.40	8.93	9.42	9.90
.4 grain.....	6.71	7.14	7.53	7.92
.3 grain.....	5.03	5.36	5.65	5.94
.2 grain.....	3.36	3.51	3.76	3.96
.1 grain.....	1.68	1.78	1.88	1.98

Each grain of gold obtained after washing will, therefore, equal one ounce per ton. If the gold be—

750 fine, each ounce will be worth.....	\$15.50
800 fine, each ounce will be worth.....	16.53
850 fine, each ounce will be worth.....	17.57
875 fine, each ounce will be worth.....	18.08
900 fine, each ounce will be worth.....	18.60
920 fine, each ounce will be worth.....	19.01
920 fine, each ounce will be worth.....	19.22
930 fine, each ounce will be worth.....	19.43
950 fine, each ounce will be worth.....	19.63

Hence, multiply the value per ounce by the number of grains to give the value per ton. Example: If the washed gold weighs 2 grains, and the fineness be known or estimated at say \$16.53 per ounce, the sample above \$16.53 x 2 = \$33.06 per ton.

Mines and Mills of Shasta County.

NUMBER I.

[From Our Traveling Correspondent.]

When one steps into Shasta county to inspect the mines and mills, be naturally landed at Redding as the starting-point for getting posted. Although Redding is located on the plain (formerly known as Reading Ranch) yet within a radius of 10 miles there are many mines, and more mines than mills. The several mining districts surrounding are Lower Springs, Shasta and Old Digging.

Redding is quite a neat little town of about 1500 inhabitants, with all the modern advantages, as water works, electric lights, gas works, etc., a well-conducted and neat post-office. It has two banks, a fine large brick schoolhouse, and I don't know how many churches, as your correspondent like most miners has more use for the banks than the churches.

Redding is reached in 10 hours and 40 minutes from San Francisco. It may be considered at the foot of the great mineral ranges and at the head of the Sacramento valley, and is on the direct line of the Oregon & California railroad. Redding in time ought to be a large and good business locality, taking the vast mineral section of Shasta into consideration. I forgot to say that Redding has two weekly papers, the Free Press and the Shasta Democrat. Mining is where the wealth comes from, in two ways: First, mines bring capital into the county and then the mines bring out capital; thus one good mine discharges more money in a twelvemonth than a dozen ranches. Shasta county, from what I learn in Redding, is the richest mining county in all the State of California, but as to this I will know more after I have taken it all in.

There is one advantage, all the mining sections have fine facilities, as railroad communication, postoffices, telegraphs, etc. This I get from asking questions as to how and where to go. There are no long and tedious trips to worry you out, and a good deal can be seen in a short time if one wants to fly through, but as your correspondent has a reserve cash fund to draw on, he is going to take it easy and not worry his brains as much as he may worry others by not scratching off for the Press all he hears. The past winter has been very severe, nearly all the mills being compelled to stop work from one cause and another, but one by one they are getting their repairs made and are starting in again. The weather is now fine and spring-like.

SECTION OF HAND CRUSHER.

crushed and afterward in having the gold washed out of the crushed rock and amalgamated without loss of gold.

The Taylor hand-crusher I found answered very well for the crushing, and the improved form of batea for washing out and amalgamating the gold; but to complete the outfit, I required a portable, accurate and cheap balance. After many attempts, in which I was kindly as-

THE BATEA.

sisted by M. G. Rockwell and M. Bohn, and taking Dr. Bleck's invention as a model, I have at last succeeded in making a balance which, I think, will answer the purpose as well as Messrs. Taylor are now making one something after the same pattern but with improvements.

The balance and frame, as shown by the accompanying drawing, is about seven inches long and one and a half wide and one inch deep. The balance is a German-silver beam, six inches long and one-fourth of an inch wide; the fulcrum knife-edged and the bearing pieces

AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description

ALL WORK TESTED AND GUARANTEED.

IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY. 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentes and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List.

Pacific Chemical Works.

HENRY G. HANKS,

**Practical and Industrial Chemist, Assayer
 and Geologist,**

718 MONTGOMERY ST., - SAN FRANCISCO.

Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry

SQUARE FLAX PACKING,

Manufactured from strictly first-class Flax and pure lubricants. Superior to all others for water and steam. Pack with less friction and makes a tighter joint than any other packing made. Imitations of inferior quality having been put upon the market, we have been compelled to adopt the above trade-mark, and all of our packing will now have a RED CORD running through the center its entire length. See that you get it and take no other. Sold by all Hardware dealers. Price, 50 cents per pound. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market Street, San Francisco, Cal.

PAT. OCT. 25, 1831.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all
Mining and Manufacturing Machinery.
Adapted to heads running from 20 up to 2,000 feet.
From 12 to 20 per cent better results guaranteed than
can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long
distances with small loss, and is now extensively used in
all parts of the country for generating both power and
light.

APPLICATIONS

Should state amount, and head of water, power required,
and for what purpose; with approximate length of pipe;
also, whether the application is with reference to *Wheels*
or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given
amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and
high heads are utilized, and are guaranteed to give more power with less water than
any other wheel made. Being placed on horizontal shaft, the power is transmitted
direct to shafting by belts, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in
capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,
by applying to the manufacturers.

And Upward.

Rooms with or without Board.

Free Coach to the House

J. POOLEY.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, April 24, 1890.

Trade in all branches continues free. With the foundrymen there appears to be a better feeling, owing to their being more successful in securing molders. It now looks as if they will be soon in full running condition, which will enable them to accept all orders sent at far more satisfactory figures to all in interest than previous to the iron-molders' strike. It is very generally claimed that more mining machinery will be wanted this year than for several years past. It is also claimed that the requirements for other machinery and ironwork are of a very promising character.

The local money market is reported easy, with no decided call for funds for any particular purpose; while remittances are quite free. The more favorable consideration of Congress looking toward remonetizing silver is having a favorable influence. When enacted into a law, it will revive speculation and also many languishing industries.

MEXICAN DOLLARS—The market is dull but firm at 79 1/2 @ 79 3/4 c.

Mexican dollars to-day are quoted at 79 1/2 to 80 cents strong.

SILVER—The market abroad made quite an upward move, due to the favorable action of the Congressional Committee having the Silver bill in charge. It set back again at the first signs of disagreement, only to recover with an amicable understanding arrived at. The Republican caucus has agreed on a plan of action, viz., the purchasing monthly of 4,500,000 ounces of silver at the market price thereof, not exceeding \$1 for 371.25 grains of pure silver, and issuing in payment Treasury notes of the United States in denominations of not less than \$1 nor more than \$1000; the Treasury notes to be redeemable on demand in lawful money of the United States. The legal-tender quality of the notes is restricted to the payment of customs dues and public debts, and shall be counted as part of the reserves of the National banks. A holder of the notes can upon demand receive, in lieu of coin, silver bullion at its market value on the day when the demand is made. Several Republican members favor free coinage, and unless still more favorable action is secured to the silver interest of the country, they may act with the Democrats in passing a free-coinage Act.

With the Comstock ore going largely gold and favorable legislation on silver by Congress, the European nations will undoubtedly be more favorably disposed toward the metal.

The Mint the past week paid \$1.01 an ounce, then dropped to 99 cents, advanced again to \$1, and to-day pays \$1.01, with a rising tendency. London was cable to-day 47d, and New York came through at \$1.05. This latter price is above the English parity. The parity in our (San Francisco) market is from \$1.03 to \$1.03 1/2. The advance in New York is largely due to an active speculation in silver warrants, which have been dead for at least four years. It is claimed by those who are in position to know that the New York market for silver warrants will advance to still higher figures, probably to \$1.10, before there is much of a set-back.

QUICKSILVER—Receipts the past week aggregated 494 flasks. The market continues to hold strong, with a good demand ruling.

BORAX—Receipts the past week aggregated 567 cts. The market is fairly steady, with a good demand ruling from the East.

LIME—Receipts the past week aggregated 6384 bbls. The home demand continues quite active, necessitating free receipts. Quotations are unchanged.

LEAD—The market is reported unchanged. Eastern advices are unsatisfactory. This denotes more or less uncertainty in the near future.

COPPER—With better mountain transportation facilities, the receipts ought to show some increase at the seaboard ports. The market has ruled fairly steady. In this country the consumption is still quite large. London cables report the market has been affected by the depression prevailing in the general metal trade, and the business in merchant bars is slow. Consumers are buying other sorts than Chili bars, owing to slack deliveries of the latter. The large quantity held by outside French financiers is being absorbed. Large holders will not sell below £50.

IRON—With cheapening markets abroad and at the East, and freights not so stiff, our market begins to show an easier tone. The consumption is beginning to show a steady increase as more molders are secured by the foundrymen. The London cable to the Iron Age of April 17th reports as follows: There has been a further serious decline in prices of warrants, due to heavy realizations on the part of holders. Scotch sold down Tuesday at 45s. 7d. and closed at 45s. 11d. Middlesbrough dropped to 45s. 7d. and Hematites to 45s. 11d. To-day there were sales at 46s. for Middlesbrough and 45s. 6d. for Hematites.

Quotations to April 6th of Scotch pig are as follows:

No. 1 Coltness, f. o. b. Glasgow	70s. 6d.
No. 1 Summerlee, " "	70s.
No. 1 Langley, " "	69s.
No. 1 Langloan, " "	70s.
No. 1 Carabrook, " "	70s.
No. 1 Shorts, " at Leith	71s.
No. 1 Glenarnock, " Ardrossan	70s.
No. 1 Dalzell, " "	69s.
No. 1 Eglinton, " "	49s. 6d.

Since writing the above on iron, a more thorough canvass of the iron market shows that there are only about 1000 tons in first hands, which is firmly held. The feeling with holders is bullish. The imports the past week were 400 tons pig iron from England.

TIN—The market is fairly steady at unchanged quotations. English advices report an easier market.

COKE—Imports the past week aggregated 750 tons. The market is steady, with holders firm.

COAL—Imports the past week aggregated as follows: Coos Bay, 1150 tons; Puget Sound, 1200; Comox, 4200; Seattle, 3259; Nanaimo, 2308; De-

parture Bay, 2350; total, 14 467 tons. For loading two brands of English are cheaper. Australian for prompt loading is strong, but as charters are strengthening here, it is claimed that more vessels will be likely to load there for this port, so as to load wheat hence for Europe. On spot, steam and gas coals are stiff, but household coals are easy. The consumption of the latter is falling off, while that of the former is increasing.

Eastern Metal Markets.

By Telegraph.

NEW YORK, April 24, 1890.—The following are the closing prices the past week:

Silver In	Silver in	Copper.	Lead.	Tin.
Thursday... 46 1/2	1 00 1/4	\$14 20	\$3 85	\$19 80
Friday... 46 1/2	1 00 1/4	14 20	3 85	19 70
Saturday... 46 1/2	1 00 1/4	14 20	3 87 1/2	19 80
Monday... 46 1/2	99 3/4	14 20	3 87 1/2	19 95
Tuesday... 46 1/2	99 3/4	14 20	3 87 1/2	19 75
Wednesday... 46 1/2	1 00 1/4	14 20	3 87 1/2	19 80

NEW YORK, April 22.—Quicksilver fairly steady. Borax is firm. Outside of the deliveries of old contracts nothing in copper; Lake, 1 1/4 @ 1 1/2 c; hids rejected; Arizona, 13 @ 13 1/2 c; casting, 12 1/2 @ 12 3/4 c. No reaction in pig lead; \$3.85, \$3.75 full.

Mining Share Market.

The mining share market for the Comstocks set back, with slight reactions up to Monday, when the lowest prices were reached. Since then the market has gradually strengthened, with no particular stocks in the lead. The movements are more general than at any time since the first signs of a deal being on foot. As usual, the street is full of rumors, with the bear points predominating. While we think the market will do better, yet outsiders will do well to keep in mind that it may result as usual in peddling out stocks, and then letting the market go down again, or in other words, an assessment deal. In the outside stocks the Bodies and Quijotas have been steady. The Tuscaroras had quite an upward move under a reported contest for the control of Commonwealth. Last year there was a reported contest for Bodie. The stock advanced, but afterward went down on assessments to about one-ninth what it sold for to outsiders. Election contests are dangerous for outsiders. Holmes advanced to \$4 a share, but no business was done, owing, probably, to the better-informed knowing that a suit is still pending for \$2,000,000 damages, brought against the company by Southern Nevada.

From the mines, our advices are favorable from the Quijotas. The official letters from the Bodies report a large amount of active prospecting going on. From the Tuscaroras, official letters are still favorable. From the Comstock, reliable advices report quite an improvement on the 1600-foot level to the west. From the other North End mines, the work going on is said to be of an important character. In Hale & Norcross there is an improvement on the 1300-foot level. The pulp assays are higher. An improvement is reported in Chollar. In Potosi it is said that they will soon drift for the ore found in sinking the winze. The official letters of Confidence and Challenge are of the same character as given last week. They will commence next week putting the pump in place in Crown Point, to pump out the mines at that end.

General advices from the Gold Hill mines are favorable, but it is not likely that the manipulators will let much leak out until they are ready to sell stocks.

The official letter from the superintendent of the Kentucky Mining Co., Virginia, Nevada, reports active prospecting, with flattering prospects on the 900-foot level, and that in the winze they are sinking below the 950-foot level they are still in ore. The assays range from \$15 to \$72 a ton.

The continued advance in silver gives promise of a more active and higher stock market.

THE party of prospectors who invaded the Navajo reservation in New Mexico, in search of the lost Adams mine, have reported having found such rich mineral indications that endeavors are to be made to secure the passage of a bill detaching the district in the Carrizo mountains from the reservation.

Bullion Shipments.

We quote shipments since our last and shall be pleased to receive further reports: Eureka Con., April 21, \$4000; Mt. Diablo, 23, \$5985; Savage, 19, \$18,000; Hale and Norcross, 19, \$2400; Cons. California and Virginia, 19, \$54,072.

Don't Fail to Write.

Should this paper be received by any subscriber who does not wish it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Assessment Notices.

HOME MILL AND MINING COMPANY: Location of principal place of business, San Francisco, California. Location of Works, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1890, an assessment, No. 10, of 3 cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of May, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, THE 9th DAY OF JUNE, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. M. BUFFINGTON, Secretary.
Office, Room 11, No. 303 California Street, San Francisco, California.

GOLD HILL MINING COMPANY: Location of principal place of business, San Francisco, California; location of works, Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of April, 1890, an assessment (No. 9) of Twenty-five Cents per share was levied upon the capital stock of the Corporation, payable immediately, in United States Gold Coin, to the Secretary, at the office of the Company, Room 20, Phelan Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of May, 1890, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 10th day of June, 1890, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
C. A. GROW, Secretary,
Office, Room 20, Phelan Building, San Francisco, California.

Day's Improved Quartz Stamp Mill.

This Mill is designed for the Prospector, the Assayer and Sampler of Gold and Silver-bearing rock. It is a perfect mill, built entirely of metals, and of the best mechanical construction; will amalgamate perfectly in the battery or on plates. It strikes a sharp, heavy blow with a light stamp. Shipping weight, 225 lbs. Price \$75. Address

JAMES DAY.

P. O. Box 221, Chico, Butte Co., Cal.

N. B.—CHAPPELLE, Butte Co., Cal., Nov. 10, 1889.—Mr. Jas. Day, Chico: The little mill is a daisy; it comes up to all expectations; it works perfect in all respects. Yours truly,
WALKER, REESE & CO.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$900, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

Dewey & Co.'s Scientific Press Patent Agency { ESTABLISHED 1860

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered by other agencies the information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

Lake Nicaragua.

Telegrams this week from New York state that ex-Senator Warner Miller, president of

the Nicaragua Canal Co., expects to see the canal finished within seven years, and has little doubt that the money will be forthcoming to keep up the work steadily. He dwelt at length

on the advantages of the canal to the Pacific Coast. He said that the opening of the canal would create a large carrying trade between the Gulf States and the western coast of South

America, the Pacific Slope States, Australia and many other points. Undoubtedly a very large tonnage of coal from Alabama would soon pass through to points on the Pacific. The entire grain trade of California, Oregon and Washington would pass through the canal. As to new commerce in the lumber trade from Puget sound, it would increase to proportions hardly to be realized at present.

W. L. Merry of this city says there need be no apprehension about a tonnage sufficient to pay a handsome interest on the investment, steadily increasing annually. The Nicaragua canal will do more to increase the American merchant marine than all the other propositions now before the country. The company is an American one, and we intend to keep control of the great enterprise in America, where it belongs.

On this page of the PRESS is given a sketch of Lake Nicaragua from Fort San Carlos. This great lake has a surface area of 2600 square miles.

The Bodie Miner says that while there is no reason to believe there will be anything like an active boom in our mining industry, there is every reason to think that considerable mining and other business will be transacted in Mono county this summer.

THERE are two Huntington roller-mills now at work in the mines of the Golden Ox mountains, China.

SKETCH OF LAKE NICARAGUA FROM FORT SAN CARLOS.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

The Mines of Old Tuolumne.

[From Our Own Correspondent.]

EDITORS PRESS:—Tuolumne's hills are decked in green, her orchards white with fragrant blossoms. Nature is clothed in her spring suit and looking her best. In the towns there is an air of desolation. The long-continued storms of the season have caused the closing down of the mills and mines of almost the entire county. Some are just starting up, and with favorable weather the next 60 days will see everything moving with its old-time speed and the air resounding with the inspiring clatter of the stamps.

Quartz Mountain.

The Heeslep mill is running on custom rock. The owners of the Dutch mine have purchased ten stamps of the old Patterson mill and will put in the Morris canvas tables for concentrating.

Whisky Hill.

Now called Jintown, is still enjoying its winter nap. In this vicinity are large bodies of low-grade ores, which rumor has it Messrs. Hayward & Hobart are gradually securing, all on the mother lode.

Tuttlestown.

The machinery of the Patterson mine and hoist has all been taken out and is offered for sale. This mill is running on small lots of custom rock from the veins worked by the pocket miners of Jackass Mountain. The Atlas is down 100 feet by shaft and drift of 200 feet on a vein running from 1 to 20 feet of ore averaging \$4 a ton in free gold.

Sumnerville.

The Eureka Consolidated, better known as "The Old Dead Horse," is pounding away on their four-foot vein of \$6 ore. The Morris canvas tables have been put in to save the concentrates. The Albany is at rest. Dr. Walker, the owner, states that "some parties are trying very hard to make me believe that I ought to give it to them for \$50,000."

The Buchanan.

The mill has just begun dropping the stamps. Mr. Davis has in contemplation the remodeling of the power system this season and the improvement of the entire plant.

Cherokee.

This camp, with its high-grade ore, is awaiting the coming of settled weather. While the veins are not large, the ore is high in grade and the shoots of sufficient length to make the veins profitable.

Soulsbyville.

The Old Soulsby is still resting on her laurels. Mr. W. Sharwood, who is now the owner of the Soulsby, is confident that the vast extent of unexplored territory, still virgin, in the Soulsby, with the necessary capital, could easily be developed from the old shaft, and without doubt ore equal in quantity and quality with that which made the Soulsby famous in the past, be discovered.

At the Carrie the shaft is going down.

The Black Oak was sold by the sheriff, and the purchasers are taking out the water. The owners have their time to recover the property. Why this mine with a long shoot on a large vein of \$24 rock, with a complete steam and water power mill, should fall into the hands of the sheriff, is one of those things "that no fellow can find out," but certainly points to some gross fault in the management.

Columbia.

A few Chinamen are ground-sluing, and the usual number of pocket miners are making average wages in their mines. To the north, the Keltz, the property of W. Sharwood, is being vigorously prospected. The tunnel is now in 300 feet on a vein running from two to five feet of ore milling \$12.

At the Mary Ellen the tunnel is now in 200 feet on a vein running from one to four feet, the last ore milled going \$24.50 a ton. The five-stamp mill is now hung up. It is reported that an English company will shortly take hold of this mine and equip it in first-class shape.

Sonora.

The superintendent, Mr. E. Loftus, is getting the ores of the Golden Gate under control. In fact it may be said to have passed through the experimental stage and settled down to an assured success. The Boss process was employed, but while it worked the ores up to a high percentage, the plant could not handle the mill's output. At present the ores are crushed wet, the sulphurets caught on corduroy Frue belt, and the slimes concentrated by Morris canvas tables placed below the Frues. The concentrates are sold to the Maltman Chlorination Works of Sonora.

The mill is of 10 stamps of 950 pounds each, crushing 2½ tons to the stamp through a 40-mesh screen. The ores are almost entirely sulphurets, the average being high in grade, while the gold is as high as 990 fine.

Mr. Loftus has just completed a 60-light electric plant for the mine and mill. The shaft on the mine is down 300 feet on a vein that in places is 12 feet in width. Both mine and mill are run by water-power. The mill-power proves what can be done with a low head of

water by use of the Pelton wheels. Mr. Loftus has brought in the free water of a neighboring stream, and with but 30 feet of pressure, by means of three nozzles playing on a 6-foot Pelton wheel, secured power to drive all the machinery of the mill. The wheel is 600 feet distant from the mill, power being conveyed by wire cable. Mr. W. J. Sharwood is employed as assayer, and promises to, in time, equal his father in ability as a mining-man. The mine has now every appearance of being on the road to success, and the owners can congratulate themselves that Mr. Loftus has brought them safely through their experimental stage to the present one of assured success.

San Guleappa.

This mine is now the property of ex-Gov. Perkins, R. A. McDonald, A. Halsey and Captain Griffith, who also have the bond on the New Albany. At the San Guleappa the shaft is down 136 feet on a vein running from ten inches to two feet. The ore is almost entirely sulphurets, the gold exceptionally high, running over 990 fine. At present the work is altogether of a developing character, the ore extracted being very high in grade.

The Bonanza.

The superintendent and fortunate part owner, Mr. Oliver, has put down a shaft 170 feet to crosscut the vein. His neural luck (ability) has been rewarded, and the bottom of the shaft is in the black metallic slates which accompany the gold-bearing portion of the vein. By the time this reaches the readers of the PRESS, the vein will have been crosscut, and without a doubt the owners will again be in bonanza. Of this they are confident, one of the owners, Mr. Rogers, assuring me that he was just as confident that they would find it as rich as in the past, as he was in the second coming of Christ.

The PRESS illustrated this bonanza about a year ago. To those who were not then readers of the PRESS I would repeat that the vein is what miners would term a porphyry dyke inclosed in slate walls. The slate is of the brown-black variety, except where the pockets occur. Here it is of the black metallic. The dyke or vein has small seams of quartz running through and with the course of the vein, these quartz seams occurring near both walls and in the center. Crossing the vein at different angles are iron seams called by the miners "gold seams." On this vein, where the walls are of metallic slates, near the footwall, at the crossings of the "gold seams" with the quartz stringers, the gold occurs. This black slate is followed and the gold seams do not fail to lead to the gold. Now that the lessees are down and all of the former difficulties overcome, the PRESS will be called upon each week to chronicle the unheard-of yields of this "the old Bonanza."

Maltman Chlorination Works.

The mine-owners of Tuolumne have long labored under the expense of shipping their concentrates by wagon and rail to distant points for treatment. Mr. Maltman, with his chlorinating plant, has been a much-needed and now duly appreciated convenience. These works have at present a capacity of 2½ tons a day. A rock-breaker and Austin pulverizer, run by Pelton wheel, are used for sampling ores. This season a complete ten-stamp custom mill will be put in. The plant is just at the edge of the town of Sonora and is assured of a steady supply of concentrates from the sulphurets mines of the vicinity. "Old Tuolumne," like "Old Virginia," "never tires," and such success marks a steady advance in her mining prosperity.

E. H. SCHAEFFLE.

Kern County Mines.

EDITORS PRESS:—After a decade of desolations, quartz mining may be said to be a growing industry in this section. The amount of gold extracted from the rock during the last year, in this vicinity, was double that of the year before.
